ANGUILLA (*Encycl.*), one of the Caribbee islands, has its name from its snake-like form; and is about ten leagues in length, and three in breadth. It was first discovered by the English in 1650, when it was filled with alligators and other noxious animals; but they, finding the soil fruitful, and proper for raising tobacco and corn, settled a colony on it, and imported live cattle, which have since multiplied exceedingly. But the colony not being settled under any public encouragement, each planter laboured for himself, and the island became a prey to every rapacious invader, which disheartened the inhabitants so much, that all industry was lost among them. Their chief suffering was from a party of wild Irish, who landed here after the revolution, and treated them worse than any of the French pirates who had attacked them before. The people of Barbadoes, and other English Caribbees, knowing the value of the soil, several of them removed to Anguilla, where they remained for many years, and even carried on a profitable trade, though without any government either civil or ecclesiastical. In 1745, their militia, though not exceeding 100 men, defended a breast-work against 1000 French who came to attack them; and at last obliged them to retire with the loss of 150 men, besides carrying off some of their arms and colours as trophies of their victory. Since that time the inhabitants have subsisted mostly by farming; though they still plant sugar, and the island is said to be capable of great improvements.

ANGUILLABA, a town of Italy, in the patrimony of St. Peter, fifteen miles N.W. of Rome.

ANGUIS, or SNAKE (*Encycl.*), in zoology. Of this genus, belonging to the order of amphibia serpentes, several species are described in our original article. As, however, delineations of these animals are more satisfactory than mere verbal description, we have given in Pl. 12. a representation of the seventh and fifteenth species, viz. the anguis *meleagris*, and anguis *scutellata*.

ANGUSSHIRE, a county of Scotland (sometimes called FORFAR, from the name of the county-town), bounded on the N. by Aberdeenshire, on the N. E. by Kincardineshire, on the E. by the German Ocean, on the S. by the frith of Tay, and on the W. by Perthshire. Its length and breadth are nearly equal, about thirty-five miles. It has many lakes and hills, but is fruitful in corn and pastures. The principal rivers are the North and South Esk.

ANHINGA, in ornithology, a species of the pelicanus; consists of four known varieties, two peculiar to America, one to Senegal, and the fourth to the region about the Cape of Good Hope. This last is thus described by Le Vaillant in his New Travels into the Interior Parts of Africa.

"The denomination of *Slange-Hals-Voogel*, given to it by the Hottentots, characterises the anhinga in a very simple and accurate manner. Buffon, who was struck with the conformation peculiar to birds of this kind, has delineated them by a similar expression. 'The anhinga (says he) exhibits a repulse grafted on the body of a bird.' See Pl. 11. Indeed there is no person who, upon seeing the head and neck only of an anhinga, while the rest of the body is hid among the foliage of the tree on which it is perched, would not take it for one of those serpents accustomed to climb and reside in trees; and the mistake is so much the easier, as all its tortuous motions singularly favour the illusion. In whatever situation the anhinga may be seen, whether perched on a tree, swimming in the water, or flying in the air, the most apparent and remarkable part of its body is sure to be its long and slender neck, which is continually agitated by an oscillatory motion, unless in its flight, when it becomes immovable and extended, and forms with its tail a perfectly straight and horizontal line.

"The true place which nature seems to have assigned to the anhingas, in the numerous class of the palmipedes, is exactly between the cormorant and the grebe. They partake indeed equally of both these genera of birds, having the straight slender bill and the long neck of the latter; while they approach the former by the conformity of their feet, the four toes of which are joined by a single membrane. They partake also of the cormorant by their flight; having like it the wings larger and fitter for the purpose than those of the grebe, which are short and weak. The tail of the anhinga is extremely long; a characteristic very singular and remarkable in a water fowl, and which ought, it would seem, to render them totally distinct from diving birds, which in general have little or no tail. By this trait they approach still nearer to the cormorants; for though the tails of the latter are shorter, the quills of both have a great resemblance to each other, since their quills are equally strong, elastic, and proper to form a rudder when these fowls swim through the water in pursuit of fish, which constitute their principal nourishment. When the anhinga seizes a fish, he swallows it entire if it be small enough, and if too large he carries it off to a rock or the stump of a tree, and fixing it under one of his feet, tears it to pieces with his bill.

"Though water is the favourite element of this bird, it builds its nest and rears its young on rocks and trees; but it takes great care to place them in such a manner, that it can precipitate them into a river as soon as they are able to swim, or the safety of the little family may require it."

The male anhinga differs from the female, which is smaller, in having the whole under part of the body, from the breast to the root of the tail, of a beautiful black, while the latter has the same parts of a yellowish white colour. It has also, on each side of its neck, a white stripe, which extends from the eye to the middle of its length, and intersects a reddish ground. A very singular characteristic, common to all the anhingas, is that of having the feathers of the tail deeply striated, and as it were ribbed. It is a very facagious bird, especially when surprised swimming; for its head is the only part which it exposes above the water; and if the sportsman once misls that part, the anhinga plunges out of sight entirely, and never more shews itself but at very great distances, and then no longer at a time than is absolutely necessary for breathing.

ANIAN, the name of a strait formerly supposed to lie between the north-east of Asia, and the north-west of America; but now found to exist only in imagination.

ANIMADVERSION, in matters of literature, is used to

signify sometimes correction, sometimes remarks upon a book, &c. and sometimes a serious consideration upon any point.

ANIMALCULE (*Encycl.*). The references to Pl. 15. should have been to Pl. 16.

ANIO (Cicero, Horace, Priscian); ANIEN (Statius); now *il Tevere*: a river of Italy, which falls into the Tiber, three miles to the north of Rome, not far from Antemnae. It rises in a mountain near Treba (Pliny); and, running through the country of the *Aequili*, or *Aequi*, it afterwards separated the Latins from the Sabines; but nearer its mouth, or confluence, it had the Sabines on each side. It forms three beautiful lakes in its course (Pliny). In the territories of Tibur it falls from a great height, and there forms a very rapid cataract; hence the epithet *praeceps*, and hence the stream caused by its fall (Horace). *Anienus* is the epithet formed from it (Virgil, Propertius): *Anienus* is also the god of the river (Propertius, Statius).

ANNAMOCCA, an island in the South Sea, discovered by Taffman in 1643, and visited by Captain Cook in 1774 and 1777. It is well cultivated in many places, consisting of plantations of yams and plantains. Many of them are extensive, and inclosed with neat fences of reed. The bread-fruit and cocoa-nut trees are interpersed with little order, but chiefly near the habitations of the natives; and the other parts of the island, especially toward the sea, are covered with trees and bushes of a luxuriant growth. The inhabitants are a friendly people, but much addicted to stealing the property of European visitors. This is one of the Friendly Islands, situated about 187 E. long. and 20 S. lat.

ANNAN, a river in Scotland, which rising in the Moffat Hills, and flowing in a southerly direction, through Annandale, empties itself into Solway Frith.

ANNANDALE, a district of Dumfriesshire in Scotland, so called from the river Annan. The mountains in the northern part of this district, sometimes named Moffat Hills, are the highest in the south of Scotland. From these descend the Tweed, the Clyde, and the Annan.

ANNAND (William), dean of Edinburgh in Scotland, the son of William Annand, minister of Air, the head burgh royal of the shire of Air, in the diocese of Glasgow, was born at Air in 1633. In 1651 he was admitted a scholar in University College in Oxford; and though he was put under the care of a presbyterian tutor, yet he took all occasions to be present at the sermons preached by the loyal divines in and near Oxford. In 1656, being then bachelor of arts, he received holy orders from the hands of Dr. Thomas Fulwar, bishop of Ardfert, or Kerry, in Ireland, and was appointed preacher at Weston, on the Green, near Bicester, in Oxfordshire, where he met with great encouragement from Sir Francis Norris, lord of that manor. After he had taken his degree of master of arts, he was presented to the vicarage of Leighton-Buzzard in Bedfordshire, where he distinguished himself by his edifying manner of preaching, till 1662, when he went into Scotland, in quality of chaplain to John earl of Middleton, the king's high-commissioner to the church of that kingdom. In the latter end of the year 1663, he was instituted to the Tolbooth church, at Edinburgh, and from thence was removed some years after to the Trone church of that city, which is likewise a prebend. In April 1676, he was nominated by the king to the deanery of Edinburgh; and in 1685 he commenced doctor of divinity in the university of St. Andrews. He died the 13th of June, 1689. Dr. Annan wrote several pieces, particularly the following, viz. 1. The Doctrine of the Catholic Church. 2. Solutions of many proper and profitable Questions. 3. A short Discourse tending to prove the Legality, Decency, and Expediency, of set Forms of Prayer. 4. The

Lord's Prayer explained. 5. The Mystery of Godliness. 6. Glory to the Father, &c. 7. A twofold Subject explained and opened.

ANNESLEY (Arthur), earl of Anglesey, and lord privy seal in the reign of King Charles II. was the son of Sir Francis Annesley, bart. lord Mount Norris, and viscount Valentia, in Ireland; and was born at Dublin on the 10th of July, 1614. He was for some time at the university of Oxford, and afterwards studied the law at Lincoln's Inn. He had a considerable share in the public transactions of the last century; for in the beginning of the civil war he sat in the parliament held at Oxford, but afterwards became reconciled to the opposite party, and was sent commissioner to Ulster, to oppose the designs of the rebel Owen Roe O'Neal. He engaged in several other affairs with great success. He was president of the council of state after the death of Oliver, and was principally concerned in bringing about the Restoration, soon after which, King Charles II. raised him to the dignity of a baron, by the title of lord Annesley, of Newport Pagnall, Bucks; and a short time after, he was made earl of Anglesey. During that reign he was employed in some very important affairs, was made treasurer of the navy, and afterwards lord privy-seal. In October 1680, his lordship was charged by one Dangerfield, in an information delivered upon oath, at the bar of the House of Commons, with endeavouring to stifle evidence in relation to the Popish plot, and to promote the belief of a Presbyterian one. The uneasiness he received from this attack did not prevent his speaking his opinion freely of those matters in the House of Lords, particularly in regard to the Popish plot. About the same time he answered the Lord Castlereagh's Memoirs, in which that nobleman endeavoured to paint the Irish rebellion in the lightest colours; and a sharp dispute was raised, which ended in the seals being taken from him. He was a person of great abilities, had uncommon learning, and was well acquainted with the constitution and laws of England. He wrote, besides his Animadversions on Castlereagh's Memoirs, 1. The Privileges of the House of Lords and Commons stated. 2. A Discourse on the House of Lords. 3. Memoirs. 4. The History of the Troubles in Ireland, from the Rebellion in 1641, till the Restoration. 5. Truth unveiled, in behalf of the Church of England;—and some other works. He died in April 1686, in the 73d year of his age; and was succeeded by his son James.

ANNIHILATION (*Envel.*). The Persian bramins hold, that, after a certain period of time, consisting of 71 joogs, God not only annihilates the whole universe, but every thing else, angels, souls, spirits, and all, by which he returns to the same state he was in before the creation; but that, having breathed a while, he goes to work again, and a new creation arises, to subsist 71 joogs more, and then to be annihilated in its turn. Thus they hold there have been almost an infinite number of worlds: but how many joogs are elapsed since the last creation, they cannot certainly tell; only in an almanac written in the Sanscrit language in 1670, the whole is said to be then 3,892,771 years old from the last creation.

The Siamese heaven is exactly the hell of some Socinians, and other Christian writers; who, shocked with the horrible prospect of eternal torments, have taken refuge in the system of annihilation. This system seems countenanced by scripture; for that the words *death*, *destruction*, and *perishing*, whereby the punishment of the wicked is most frequently expressed in scripture, do most properly import annihilation and an utter end of being. To this Tillotson answers, that these words, as well as those corresponding to them in other languages, are often used, both in scripture and in other writings, to signify a state of great misery and suffering, without the

utter extinction of the miserable. Thus God is often said in scripture to bring *destruction* on a nation, when he sends judgments upon them, but without exterminating or making an end of them. So in other languages, it is frequent, by *perishing*, to express a person's being made miserable; as in that known passage in Tiberius's letter to the Roman senate: *Ita me dii, deaque omnes, pœius perdant, quam hodie perire me sentio.* As to the word *death*, a state of misery which is as bad or worse than death may properly enough be called by that name; and thus the punishment of wicked men after the day of judgment is in the book of Revelations frequently called the *second death*.

Some Christian writers allow a long time of the most terrible torments of sinners; and after that, suppose that there shall be an utter end of their being. Of this opinion Irenæus appears to have been; who, according to M. du Pin, taught that the souls, at least of the wicked, would not subsist eternally; but that, after having undergone their torments for a certain period, they would at last cease to be at all. But Tillemont, Petit, Didier, and others, endeavour to defend Irenæus from this imputation, as being too favourable to the wicked.

It has been much disputed among divines, whether, at the consummation of all things, this *earth* is to be annihilated, or only purified, and fitted for the habitation of some new order of beings. Gerard in his Common Places, and Hakewill in his Apology, contend earnestly for a total abolition or annihilation. Ray, Calmet, and others, think the system of renovation or restitution, more probable, and more consonant to scripture, reason, and antiquity. The fathers who have treated on the question are divided; some holding that the universe shall not be annihilated, but only its external face changed; others asserting, that the substance of it shall be destroyed.

How widely have the sentiments of mankind differed as to the possibility and impossibility of annihilation! According to some, nothing so difficult; it requires the infinite power of the Creator to effect it: some go further, and seem to put it out of the power of God himself. According to others, nothing so easy: Existence is a state of violence; all things are continually endeavouring to return to their primitive nothing; it requires no power at all; it will do itself; nay, what is more, it requires an infinite power to prevent it.

Many authors consider preservation as a continual reproduction of a thing, which, subsisting no longer of itself, would every moment return into nothing. Gassendi on the contrary asserts, that the world may indeed be annihilated by the same power which first created it, but that to continue it there is no occasion for any power of preservation.

Some divines, of which number the learned Bishop King seems to be, hold annihilation for the greatest of all evils, worse than even the utmost torments of hell-flames: while others, with some of the eastern philosophers, acknowledge annihilation for the ultimate pitch of happiness human nature is capable of; that sovereign good, that absolute beatitude, so long vainly fought for by the philosophers, is found here. No wonder it has been so long concealed; for who would have thought of looking for the *summum bonum*, where others have placed the sum of misery?

The said prelate proposes it as a question, Whether suffering eternal torments be a greater evil than not existing? He thinks it highly probable, that the damned will be such fools, that, feeling their own misery in the most exquisite degree, they will rather applaud their own conduct, and choose to be, and to be what they are, rather than not to be at all; fond of their condition, however wretched, like people enraged, they will persist in their former sentiments without opening their eyes

to their folly, and persevere by way of indignation and revenge. Mr. Bayle refutes him on this head; but might, one would think, have saved himself the trouble.

The Talapoins hold it the supreme degree of happiness to have the soul totally annihilated, and freed from the burden and slavery of transigrations. They speak of three Talapoins, who, after a great number of transigrations, became gods; and when arrived at this state, procured this further reward of highest perfecting man can arrive at, *neuepan*, or annihilation; which at length is granted to those who are perfectly pure and good, after their souls have wandered many thousand years through various bodies.

ANO-CAPRI, the largest town in the island of Capri, belonging to the kingdom of Naples.

ANOLYMPIADES (*Encycl.*). The Eleans claimed the sole right of managing the Olympic games, in which they sometimes met with competitors. The hundred and fourth Olympiad was celebrated by order of the Arcadians, by whom the Eleans were at that time reduced very low: this, as well as those managed by the inhabitants of Pisa, they called *anolympiades*; that is, "unlawful Olympiads;" and left them out of their annals, wherein the names of their victors and other occurrences were registered.

ANOSSE (*Encycl.*). This province is watered by many rivers, most of which run into the *Franchere*, *Ramevotte*, or *Immour*, the spring of which is in a mountain called *Manghage*, and discharges itself into the sea in Lat. 25. 18. S. The mouth of this river is often stopped, and the course to the sea interrupted, unless kept open by the overflowings of great rains and high tides. The water runs half one league above the mouth, particularly in a free communication with the sea. A lake, called *Ambou*, is formed at the mouth, half a league wide, with depth sufficient for any ship if the mouth of the river was kept open. Next in bigness to the *Franchere* is the *Manghafia*, which springs from a mountain called *Silica*, and empties itself into the sea, where large ships may ride at anchor. Crocodiles breed in these and all the other rivers of the island.

Between the two rivers above mentioned lies Cape St. Romain, half a mile distant from the mouth of the *Franchere*, and which runs from the north-west six or seven leagues into the sea. When the Cape is passed, the coast forms a great bay, in the shape of a cross, which extends to the mouth of a river called *Djan Panouge*, or *Pitoruk*. In the middle of this bay the land runs out, and almost forms a peninsula called *Tholangare*. Fort Dauphin lies to the north of this peninsula, and Port Dauphin over against it. This province has several other peninsulas and small islands belonging to it. The country is beautiful; abounds in fruit-trees; is fertile in pastures for cattle; and, if carefully cultivated, would produce all the necessities of life. It is surrounded by high mountains, which are covered with woods and shrubs; but, about four miles distant from Fort Dauphin, the adjacent hills are quite destitute of verdure. The French often dug in this neighbourhood, expecting to meet with mines of gold and silver, particularly in one mountain where several springs flow near each other, and empty themselves into a neighbouring river. In this river they found several stones and heaps intermixed with yellow clay, with a great quantity of black and white spangles shining like silver, which they carefully pounded and washed, but without effect. About sixty yards above these springs the grass and every sort of vegetable appears half dried and yellow, from a metalline sulphur which gives that aspect; but the top of the mountain is covered with a fresh and beautiful verdure. It is said that the Portuguese found gold at the foot of the mountain on the north-side, but that the place they

had dug was filled up by the chiefs of the country after the Portuguese had been driven out.

The province of Anossi is inhabited by three different sorts of whites, and four sorts of negroes. The whites are distinguished by the names of *Rolandrians*, *Anacandrians*, and *Ondaschi*. The whites are distinguished from the negroes by the general name of *Zafaramini*, or *Rahimini*; and the Rolandrians are distinguished above the other whites. When they proceed to an election of a sovereign, whom they call *Ompandrian*, or *Dian Bahouache*, he is chosen from the Rolandrian race. Next to him the others hold the rank of princes, and are honoured as such by all the rest of the subjects. The Anacandrians are descendants of the chiefs, but who have degenerated, and are accounted the bastards of princes, or those who are descended from a Rolandrian and any inferior white or black woman. These are likewise called by the name of *Ontempafimacca*, or people from the sandy parts of Mecca, from whence, they say, came the Rolandrians. Both the Rolandrians and Anacandrians wear long hair, which hangs down in curls; and enjoy the privilege of killing beasts. The Ondaschi, or lowest class of whites, are descended from the bastards of the Anacandrians. These are all stiffermen, and are allowed to kill no land animals except chickens.

The four classes of negroes are named *Voadziri*, *Lohavohits*, *Ontsoa*, and *Ondeees*. The Voadziri, the most powerful and the richest, are masters of several villages, and descended from the original lords of the country. They enjoy the privilege of killing beasts, when at a distance from the whites, and no Rolandrian or Anacandrian in the village. The Lohavohits are descendants from the Voadziri, and also lords; but with this difference, that the one commands a whole district, and the jurisdiction of the others extends only to their own village and family. They are also permitted to kill those beasts they intend to eat, when at a distance from the whites. The Ontsoa are next to the Lohavohits, and are their near relations. The Ondeees are the lowest of all, being originally slaves by father and mother. The Voadziri, Lohavohits, and Ontsoa, enjoy the privilege of submitting themselves, on the death of their lord or king, to any chief they please. In return for such homage the new lord makes them a present, in consequence of which he becomes heir to all their possessions. Hence the lower classes both of whites and blacks, when death approaches, are under the greatest concern and anguish of mind, well knowing that their lords will not fail to deprive their children of every thing they possess. Ondeees have not the same liberty with the others; but, in times of famine, the chiefs are obliged to supply them with necessities; which if they fail to do, they have the liberty of submitting themselves to new masters. The inhabitants of this province have no temples, and very little appearance of religion; only they keep up a custom of immolating beasts upon particular occasions, as in sickness, planting yams or rice, on assemblies, &c. They offer the first-born beast to the devil and to God, naming the devil first, in this manner, *Duanbilis Aminhanhabare*, or "Lord Devil and God."—There are several towns on the river *Franchere*; and near this river the Portuguese had a fort built upon a steep rock, and several buildings below, with inclosures, which furnished all sorts of necessaries for their subsistence; but they were all massacred by the natives.

This province seems originally to have been inhabited by negroes. The whites or Zafaramini settled in it about 200 years ago, and conquered the negroes. But they themselves were conquered by the French, though under the government of a king whom they honoured as a god. In 1642, Captain Rivault obtained a permission to establish a colony in this part of the island; and accordingly took possession of it

in the name of the king of France, in the month of September, that same year. The French landed 200 men well armed and provided with store of ammunition and other necessaries for building a fort, which they immediately set about; but no sooner did the natives observe their intention, than they used their utmost art to prevent their design from taking effect. This created a war, in which the French were victors; and, the natives becoming in time much better reconciled to them, they intermarried, and lived up and down in several towns at some distance from one another, not above five or six in a place. This tranquillity lasted for some years; but at last the natives, growing jealous, resolved to free themselves from a foreign yoke, and accordingly formed a conspiracy to cut off all the French in one day; which they soon after effected, not leaving a single person alive. In 1644, the above-mentioned Fort Dauphin was erected, in lat. 25. 6. S. Many buildings were erected, behind the fort, adjoining to the governor's house, with great inclosures that produced every sort of fruit and kitchen herb. In 1656 this fort was accidentally destroyed by fire; but was soon after repaired, and still continues, notwithstanding the catastrophe above mentioned, and its garrison carries on frequent wars with the natives.

ANSELM, archbishop of Canterbury, in the reigns of William Rufus and Henry I. He was born in the year 1033, at Aost, a town in Savoy at the foot of the Alps. He became a monk in the abbey of Bec in Normandy; of which he was afterwards chosen prior, and then abbot. In the year 1092, he was invited over to England by Hugh earl of Chester; and in the year following was prevailed on, as we are told, with great difficulty, to accept the archbishopric of Canterbury. He enjoyed celebrity on the clergy; for which he was banished by King Rufus, but recalled by Henry at his coming to the crown. He refused to consecrate such bishops as were invested by the king, according to Pope Urban's decree; flatly denying it to be the king's prerogative: for this he was ousted again; till, the pope and king agreeing, he was recalled in 1107. In short, from the day of his consecration to that of his death, he was continually employed in fighting the prerogative of the church against that of the crown; and for that purpose spent much of his time in travelling backwards and forwards between England and Rome, for the advice and direction of his holiness. At the council of Bari, in the kingdom of Naples, the pope being puzzled by the arguments of the Greeks against the Holy Ghost's proceeding from the Father, he called upon Anselm, who was present, and he discussed their objections with great applause. Priests call him a resolute saint; to other people he appears to have been an obstinate and insolent priest. He wrought many miracles, if we believe the author of his life, both before and after his death, which happened at Canterbury, in the 76th year of his age, anno 1109. He was canonised in the reign of Henry VII. Anselm, though we may disregard him as a saint, deserves to be remembered as one of the principal revivers of literature, after three centuries of profound ignorance.

His works have been printed in different years, and at different places, viz. Nuremb. 1491. Paris, 1544 and 1549. Venice, 1549. Cologne, 1573 and 1612. Lyons, 1630. But the best is that of Father Gerberon, printed at Paris, 1675. It is divided into three parts; the first contains dogmatical tracts; and is entitled *Monologia*; the second contains practical and devotional tracts; the third part consists of letters in four books.

ANSIBARIL, or ANSIVARI (Encycl.). All we know of the history of this ancient people is, that in the reign of the Emperor Nero they were driven from their possessions by the Chauci. Being then in a forlorn condition, they took posses-

sion of some uninhabited lands, which had been used as pasture for the horses of the Roman soldiers. They were led by one Boiocolus, a man of great valour, and of known fidelity to the Romans. He remonstrated to the Romans, who objected to their taking possession of these lands, That the territory in dispute was large; and requested, that it might be allowed to an unhappy people, driven from their own habitations: that, at the same time, wide tracts might be retained for the horses and cattle of the soldiers to graze in: that it was inconsistent with humanity to famish men in order to feed beasts &c.; and at last, lifting up his eyes to heaven, he asked the celestial luminaries how they could behold a desolate soil, and if they would not more justly let loose the sea to swallow up usurpers, who had engrossed the whole earth? To this the Roman commander, Avitus, replied, the weakest must submit to the strongest; and that since the gods, to whom they had appealed, had left the sovereign judgment to the Romans, they were resolved to suffer no other judges than themselves. To Boiocolus himself, however, he privately offered lands as a reward for his long attachment to the Romans: but this offer the brave German rejected, as a price for betraying his people; adding, "A place to live in we may want, but a place to die in we cannot." The Ansibarilii now invited the neighbouring nations to join them against the Romans; but they, dreading the power of that nation, refused to give them any assistance: upon which they applied to the neighbouring nations, begging leave to settle in their territories; but being every-where driven out as enemies and intruders, these unhappy people were reduced to wander up and down till every one of them perished.

ANSIKO (Encycl.), a kingdom of Africa. The king of Ansiko, or the great Macoco, commands thirteen kingdoms, and is esteemed the most powerful monarch in Africa. The inhabitants of Angola have a tradition, that this is the proper country of the Giagas, who came originally from Sierra Leona, and over-ran like a torrent the whole coast as far as Benguela; that, being weakened by numerous battles, and unable to force the desiles in order to return to Sierra Leona, they arrived on the borders of Monomotapa, where being defeated, they were forced to remain in the provinces of Ansiko. Be this as it will, the Ansikans yielded not in the least to the Giagas in fierceness and barbarity. They are so accustomed to the eating of human flesh, that it is asserted they have markets where it is publicly sold, and that there are no other graves for the dead than the bellies of the living. They try the courage of their prisoners of war by shooting at them as at marks, directing their arrows above or around their heads; and whoever discovers the least sign of fear, is immediately devoured without remedy. Those who appear intrepid and resolute, have their noses and ears bored, and two fore-teeth of the upper jaw drawn. They are then improved in barbarity, by accustoming them to the most horrid cruelties.

The Ansikans are neat, well-proportioned, and strong, wandering about from place to place, without either sowing or reaping. They are dreaded for their extreme brutality, and never traded with by the Europeans. Their language is barbarous, and difficult to be learned, even by the inhabitants of Congo. The most distinguished among them wear red and black caps of Portuguese velvet; the lower ranks go naked from the waist upwards; and, to preserve their health, anoint their bodies with a composition of pounded white sandal-wood, and palm-oil. Their arms are battle-axes, and small but very strong bows adorned with serpents skins. Their strings are made of supple and tender shoots of trees, that will not break, and their arrows of hard and light wood. These people, who kill birds flying, shoot with such surprising swiftness, that they can discharge 28 arrows from the bow before the first falls to the

ground. With equal dexterity they manage their battle-axes; one end of which is sharpened and cuts like a wedge, and the other flattened like a mallet, with an handle set between, about half the length of the iron, rounded at the end like an apple, and covered with the skin of a serpent.—The current money in this country is the zimbs or shell, which is fished for, and passes among several African nations.—They worship the sun as their chief deity; whom they represent by the figure of a man, and the moon by that of a woman. They have also an infinite number of inferior deities, each individual having a particular idol whom he addresses on certain occasions.

ANSPACH (the marquise of), is a small territory of Franconia in Germany, bounded on the north by the bishoprics of Wurtburg and Bamberg, which last likewise lies to the west; the earldoms of Holach and Oetting, with the bishopric of Aichtet, lie on the south; and the palatinate of Bavaria and the territory of Nuremberg on the east. The country is fruitful, and interperfed with woods, which renders it agreeable for hunting. Besides the city of Anspach, which is the capital, the chief towns are Kreglin, Swabach, Kreilheim, Rot, and Waffer-Truding.

ANSTIS (John), an able herald, was born at St. Neot's in Cornwall, Sept. 28, 1669, being son of John Anstis, of that place, by Mary, daughter and coheir of George Smith. He was admitted at Exeter College, Oxford, 1685, and three years after at the Middle Temple; represented the borough of St. Germans, 1702, 1703, 1704, in parliament, where he distinguished himself against the bill for occasional conformity, for which he got ranked in the list of the tackers, printed about that time. He was appointed deputy-general of the auditors of the imprest, 1703, which office he never executed; one of the principal commissioners of prizes, 2 Anne; Garter king of arms, 13 Anne; in which place he died, March 4, 1743-4, and was buried the 2d following, in a vault in the parish church of Dulo in Cornwall. He published, in 1706, "A Letter concerning the Honour of Earl Marshal," 8vo. in 1720, "The Form of the Installation of the Garter," 8vo. in 1724, "The Register of the most noble Order of the Garter, usually called the Black Book, with a Specimen of the Lives of the Knights," 2 vols. folio; and, in 1715, "Observations introductory to an historical Essay on the Knighthood of the Bath," 4to. intended as an introduction to the history of that order, for which the society of antiquaries had begun to collect materials. His "Aspilogia, a Discourse on Seals in England," with beautiful draughts, almost fit for publication, of which Mr. Drake read an abstract to the society in 1735-6; and two folio volumes of drawings of sepulchral monuments, stone circles, crosses, and caftles, in the three kingdoms; were purchased, with a MS. "History of Launceston," and many other curious papers (particularly a good collection of epitaphs and other inscriptions in England, and many in Wales, all fac-similes), at the sale of Mr. Anstis's library of MSS. 1768, by Thomas Aftle, esq. F.R. and A.SS. Besides these, he left in MS. two large folio volumes on the office, &c. of Garter King at Arms, and on Heralds in general; memoirs of the Talbot, Carew, Granville, and Courtney families; the Antiquities of Cornwall; "Collections relating to the Parish of Colliton in Devonshire," containing matters relative to the tithes of that church (of which his son, George Anstis, was vicar), in a dispute before the court of Exchequer in 1740, deposited in Dr. Ducarel's library; and also large collections relative to All Soul's College, Oxford, by whom they were bought. Sixty-four pages of his Latin answer to "The Case of Founders' Kinsmen," were printed in 4to. with many coats of arms. His "Curia Militaris, or a Treatise on the Court of Chivalry, in three books," was printed in 1702, 8vo. His eldest son, John Anstis, esq. who had been educated as a gentleman-commoner at Corpus Christi College, Oxford,

was, at the revival of the order of the Bath in 1725, joined to his father in the office of Garter; and had the additional office of genealogist and register of the Bath. At the opening of Dr. Radcliffe's library, 1749, he was, with several other members of that university created LL.D. He died a bachelor, Dec. 5, 1754.

ANTEDILUVIANS (*Encycl.*). The only thing we know as to the religious rites of the Antediluvians is, that they offered sacrifices, and that very early, both of the fruits of the earth, and of animals; but whether the blood and flesh of the animals, or only their milk and wool, were offered, is a disputed point.—Some have endeavoured to prove, that all the patriarchs from Adam had stated places, and annual and weekly times, set apart for divine worship, and also a separate maintenance for the priest: all which particulars may be true, though they cannot be made out from scripture. But what is more extraordinary, they pretend to tell us the very day of the week on which the antediluvian sabbath was kept; and that it was the same with the Christian sabbath, or Sunday.

Of the arts and sciences of these people we have not much more to say. They seem rather to have spent their time in luxury and wantonness, to which the abundant fertility of the first earth invited them, than in discoveries or improvements, which probably they stood much less in need of than their successors. The art of working metals was found out by the last generation of Cain's line; and music, which they might be supposed to practise for their pleasure, was not brought to any perfection, if invented, before the same generation. Some authors have supposed astronomy to have been cultivated by the antediluvians, though this is probably owing to a mistake of Josephus: but it is to be presumed, the progress they made therein, or in any other science, was not extraordinary; it being even very doubtful whether letters were so much as known before the flood; whatever is pretended by some men, who have conceived so high an opinion of Adam's knowledge, that they suppose it to have been almost universal: nor can any thing be inferred from the books attributed to that patriarch, or to Seth, and Enoch, which are forgeries too gross to deserve any consideration.

As to their politics and civil constitutions, we have not so much as any circumstances whereon to build conjectures. It is probable, the patriarchal form of government, which certainly was the first, was set aside when tyranny and oppression began to take place, and much sooner among the race of Cain than of Seth. It seems also, that their communities were but few, and confided of vastly larger numbers of people than any formed since the flood: or rather, it is a question, whether, after the union of the two great families of Seth and Cain, there were any distinction of civil societies, or diversity of regular governments, at all. It is more likely, that all mankind then made but one great nation, though living in a kind of anarchy, divided into several disorderly associations; which, as it was almost the natural consequence of their having, in all probability, but one common language, so it was a circumstance which greatly attributed to that general corruption, which otherwise perhaps could not have so universally overpread the antediluvian world. And for this reason chiefly, as it seems, so soon as the posterity of Noah were sufficiently increased, a plurality of tongues was miraculously introduced, in order to divide them into distinct societies, and thereby prevent any such total depravation for the future.

As an illustration of the remarks contained in our original article, we here introduce a table, made upon the principles there stated by Mr. Whiston. It shews at least what number of people might have been in the antediluvian world.

Number of mankind.	Year of the world.	Year of dating.	Series.

As to any history of the transactions before the flood, besides the general account already given, we are left entirely in the dark by the sacred historian. The Jews and eastern nations, however, have made ample amends for the silence of Moses, by the abundance of fables they have invented. The only part of their traditions which can be connected in any thing like history is what follows.

After the death of Adam, Seth with his family separated themselves from the profligate race of Cain, and chose for their habitation the mountain where Adam was buried, the Cainites remaining below in the plain where Abel was killed; and, according to our historians, this mountain was so high, that the inhabitants could hear the angels singing the praises of God, and even join them in that service. Here they lived in great purity and sanctity of manners. Their constant employment was praising God, from which they had few or no avocations; for their only food was the fruits of the trees which grew on the mountain, so that they had no occasion to undergo any servile labours, nor the trouble of sowing and gathering in their harvest. They were utter strangers to envy, injustice, or deceit. Their only oath was, "By the blood of Abel;" and they every day went up to the top of the mountain to worship God,

and to visit the body of Adam, as a mean of procuring the Divine blessing. Here, by contemplation of the heavenly bodies, they laid the foundations of the science of astronomy; and, lest their invention should be forgotten, or lost before they were publicly known, understanding, from a prediction of Adam's, that there would be a general destruction of all things, once by fire, and once by water, they built two pillars, one of brick, and the other of stone, that if the brick one happened to be overthrown by the flood, or otherwise destroyed, that of stone might remain. This last, Josephus says, was to be seen in his time in the land of Siriad (thought to be in Upper Egypt).

The descendants of Seth continued in the practice of virtue till the fortieth year of Jared, when an hundred of them, hearing the noise of the music, and the riotous mirth of the Cainites, agreed to go down to them from the holy mountain. On their arrival in the plain, they were immediately captivated by the beauty of the women, who were naked, and defiled themselves with them; and this is what is meant by the intermarriage of the sons of God with the daughters of men, mentioned by Moses. The example of these apostate sons of Seth was soon followed by others; and from time to time, great numbers continued to descend from the mountain, who, in like manner, took wives from the abandoned race of Cain. From these marriages sprung the giants (who, however, according to Moses, existed before); and, these were as remarkable for their impiety as for their strength of body, tyrannizing in a cruel manner, and polluting the earth with wickedness of every kind. This defection became at last too universal, that none were left in the holy mountain, except Noah, his wife, three sons, and their wives.

Berosus, a Chaldaean historian, who flourished in the time of Alexander the Great, enumerates ten kings who reigned in Chaldea before the flood: of whom the first, called *Alorus*, is supposed to be Adam, and Xisuthrus, the last, to be Noah. —This *Alorus* declared that he held his kingdom by divine right, and that God himself had appointed him to be the pastor of the people. According to our historian, in the first year of the world, there appeared out of the Red Sea, at a place near the confines of Babylonia, a certain irrational animal called *Oannes*. He had his whole body like that of a fish; but beneath his fish's head grew another of a different sort (probably a human one). He had also feet like a man, which proceeded from his fish's tail, and a human voice; the picture of him being preserved ever after. This animal conversed with mankind in the day-time, without eating any thing: he delivered to them the knowledge of letters, sciences, and various arts: he taught them to dwell together in cities, to erect temples, to introduce laws, and instructed them in geometry: he likewise shewed them how to gather seeds and fruits, and imparted to them whatever was necessary and convenient for a civilized life: but after this time there was nothing excellent invented. When the sun set, *Oannes* retired into the sea, and continued there all night. He not only delivered his instructions by word of mouth, but, as our author assures us, wrote of the origin of things, and of political economy. This, or a similar animal, is also mentioned by other authors.

Of *Alaporus*, the second king, nothing remarkable is related. His successor, *Amelon*, or *Amillarus*, was of a city called *Pantabibla*. In his time another animal resembling the former appeared, 260 years after the beginning of this monarchy. *Amelon* was succeeded by *Metalarus*, and he by *Daonus*, all of whom were of the same city. In his time, four animals, of a double form, half man and half fish, made their appearance. Their names were *Eucodrus*, *Eutegamus*, *Eneubulus*, and *Anemetus*. Under the next prince, who was

likewise of Pantabibla, appeared another animal of the same kind, whose name was *Odacon*. All these explained more particularly what had been concisely delivered by Oannes.

In the reign of the tenth king, Xifuthrus, happened the great deluge, of which our author gives the following account: Cronus, or Saturn, appeared to Xifuthrus in a dream, and warned him, that on the fifteenth of the month Dæsius mankind would be destroyed by a flood; and therefore commanded him to write down the original, intermediate state, and end of all things, and bury the writings under ground in Sippara, the city of the sun; that he should also build a ship, and go into it with his relations and dearest friends, having first furnished it with provisions, and taken into it fowls and four-footed beasts; and that, when he had provided every thing, and was asked whether he was failing, he should answer, *To the gods, to pray for the happiness of mankind*. Xifuthrus did not disobey, built a vessel, whose length was five furlongs, and breadth two furlongs. He put on board all he was directed, and went into it with his wife, children, and friends. The flood being come, and soon ceasing, Xifuthrus let out certain birds, which finding no food, nor place to rest upon, returned again to the ship. Xifuthrus, after some days, let out the birds again; but they came back again to the ship, having their feet daubed with mud: but when they were let out a third time, they came no more to the ship, whereby Xifuthrus understood that the earth appeared again; and thereupon he made an opening between the planks of the ship, and seeing that it rested on a certain mountain, he came out with his wife, and his daughter, and his pilot; and having worshipped the earth, and raised an altar, and sacrificed to the gods, he and those who went out with him disappeared. They who were left behind in the ship, finding Xifuthrus, and the persons that accompanied him, did not return, went out themselves to seek him, calling him aloud by his name: but Xifuthrus was no more seen by them; only a voice came out of the air, which enjoined them, as their duty was, to be religious; and informed them, that, on account of his own piety, he was gone to dwell with the gods; and that his wife, and daughter, and pilot, were partakers of the same honour. It also directed them to return to Babylon, and that, as the fates had ordained, they should take the writings from Sippara, and communicate them to mankind; and told them, that the place where they were was the country of Armenia. When they heard this, they offered sacrifice to the gods, and unanimously went to Babylon; and when they came thither, they dug up the writings at Sippara, built many cities, raised temples, and rebuilt Babylon again.

The Egyptians, who would give place to no nation in point of antiquity, have also a series of kings, who, as is pretended, reigned in Egypt before the flood; and, to be even with the Chaldeans, began their account the same year that theirs does according to Berofus.

There was an ancient chronicle extant among the Egyptians, not many centuries ago, which contained 30 dynasties of princes who ruled in that country, by a series of 113 generations, through an immense space of 36,525 years, during which Egypt was successively governed by three different races; of whom the first were the Auritæ, the second the Mistræ, and the third the Egyptians.

But this extravagant number of years, Manetho (to whose remains we must chiefly have recourse for the ancient Egyptian history) has not adopted; however, in other respects he is supposed to have been led into errors in chronology by this old chronicle, which yet seems to have been a composition since Manetho's time.

The account given by Berofus is manifestly taken from the writings of Moses; but we have another account of the first ages of mankind, in which no mention is made of the flood at all. This is contained in some fragments of a Phœnician author called *Sanchoniatho*, who is by some said to have been contemporary with Gideon, by others to have lived in the days of King David; while some boldly assert there never was such a person, and that the whole is a fiction of Peilo Biblius, in opposition to the books Josephus wrote against Apion. To gratify the reader's curiosity, however, we have subjoined an account of the first ten generations mentioned by him, which are supposed by the compilers of the universal history to correspond to the generations mentioned by Moses before the flood.

Sanchoniatho having delivered his cosmogony, or generation of the other parts of the world, begins his history of mankind with the production of the first pair of mortals, whom Philo, his translator, calls *Protogonus* and *Eon*, the latter of whom found out the food which was gathered from trees.

Their issue were called *Genus* and *Genca*, and dwelt in Phœnicia; but when the great drought came, they stretched forth their hands to heaven towards the sun; for him they thought the only God and Lord of heaven, calling him *Beßjamen*, which in Phœnician is, *Lord of heaven*; and in Greek, *Zeus*.

Afterwards from *Genus*, the son of *Protogonus* and *Eon*, other mortal issue was begotten, whose names were *Phos*, *Pur*, and *Phlox*; that is, *Light*, *Fire*, and *Flame*. These found out the way of generating fire, by the rubbing of pieces of wood against each other, and taught men the use thereof. These begot sons of vast bulk and height, whose names were given to the mountains on which they seized: so from them were named mount *Cassius*, and *Libanus*, *Anti-libanus*, and *Brathys*.

Of these last were begotten *Memrumus*, and *Hypsuranius*, but they were so named by their mothers, the women of those times, who without shame lay with any man they could light upon. *Hypsuranius* inhabited Tyre, and he invented the making of huts of reeds and rushes, and the papyrus. He also fell into enmity with his brother *Ufous*, who first invented a covering for his body out of the skins of the wild beasts which he could catch. And when violent tempests of winds and rains came, the boughs in Tyre, being rubbed against each other, took fire, and burnt the wood there. And *Ufous*, having taken a tree, and broken off its boughs, first was so bold as to venture upon it into the sea. He also consecrated two rude stones, or pillars, to fire and wind, and he worshipped them, and poured out to them the blood of such wild beasts as had been caught in hunting. But when these were dead, those that remained consecrated to them stumps of wood and pillars, worshipping them, and kept anniversary feasts upon them.

Many years after this generation, came *Agrens* and *Halicus*, the inventors of the arts of hunting and fishing, from whom huntmen and fishermen are named.

Of these were begotten two brothers, the inventors of iron and of the forging thereof: one of these, called *Chryfor*, the same with *Hephestus*, or *Vulcan*, exercised himself in words and charms and divinations; found out the hook, bait, and fishing line, and boats slightly built, and was the first of all men that sailed. Wherefore he also was worshipped after his death for a god; and they called him *Zeus Michius*, or *Jupiter the engineer*; and some say, his brothers invented the way of making walls of brick.

Afterwards from this generation came two brothers; one of

whom was called *Technites*, or the artist; the other *Geinus Autochthon* [the home-born man of the earth]. These found out to mingle stubble, or small twigs, with the brick earth, and to dry them in the sun, and so made tiling.

By these were begotten others; of which one was called *Agrus* [field]; and the other *Agroueris*, or *Agrotas* [husbandman], who had a statue much worshipped, and a temple carried about by one or more yoke of oxen, in Phœnicia, and among those of Byblus he is eminently called the *greatest of the gods*. These found out how to make courts about men's houses, and fences, and caves or cellars. Husbandmen, and such as use dogs in hunting, derive from these; and they are also called *Aleta* and *Titans*.

Of these were begotten *Amynus* and *Magus*, who shewed men to constitute villages and flocks.

In these men's age there was one *Eliu*, which imports in Greek *Hypsilus* [the most high], and his wife was named *Beruth*, who dwelt about Byblus: and by him was begotten one *Epigeus*, or *Autochthon*, whom they afterwards called *Uranus* [heaven]; so that from him that element which is over us, by reason of its excellent beauty, is called *heaven*: and he had a sister of the same parents, called *Ge* [the earth]; and, by reason of her beauty, the earth had her name given to it.

Hypsilus, the father of these, dying in fight with wild beasts, was consecrated, and his children offered sacrifices and libations to him.—But *Uranus* taking the kingdom of his father, married his sister *Ge*, and had by her four sons; *Ilus*, who is called *Cronus* [or Saturn]; *Betylus*; *Dagon*, who is *Siton* or the god of corn; and *Atlas*: but by other wives *Uranus* had much issue.

ANTES, in architecture, are small pilasters placed at the corners of buildings.

ANTHESTERIA (*Encycl.*). This feast, celebrated by the Athenians in honour of *Bacchus*, lasted three days, the 11th, 12th, and 13th of the month; each of which had a name suited to the proper office of the day. The first day of the feast was called *πρωια*, i. e. opening of the vessels; because on this day they tapped the vessels, and tasted the wine. The second day they called *χρος*, *congrui*, the name of a measure containing the weight of ten pounds; on this they drank the wine prepared the day before. The third day they called *καλεις*, *kettles*; on this day they boiled all sorts of pulse in kettles; which however they were not allowed to taste, as being offered to *Mercury*.

ANTHONY, or *ANTONY* (Dr. Francis), a very learned physician and chemist in the latter end of the sixteenth and beginning of the seventeenth centuries. His father was an eminent goldsmith in the city of London, and had an employment of considerable value in the jewel office under the reign of Queen Elizabeth. This son of his was born April 16, 1550; and having been carefully instructed in the first rudiments of learning while at home, was, about the year 1569, sent to the university of Cambridge, where he studied with great diligence and success, and some time in the year 1574 took the degree of master of arts. It appears from his own writings, that he applied himself, for many years that he studied in that university, to the theory and practice of chemistry, with sedulous industry, and made no small progress. When he left Cambridge and came up to London, he began to publish to the world the effects of his chemical studies, and in the year 1598 sent abroad his first treatise, concerning the excellency of a nostrum drawn from gold, which he called *aurum potable*, and which led to much literary controversy; but not having taken the necessary precautions of addressing himself to the College of Physicians, for their licence, he fell under their displeasure, and in the year 1600 had various

struggles with them, and was imprisoned for non-payment of the fines imposed on him. Dr. Goodal tells us, that this learned society thought him weak and ignorant in physic, yet it seems there were other learned bodies of another opinion; since after all these censures, and being tossed about from prison to prison, he became doctor of physic in our own universities. What chiefly contributed to maintain his reputation, and thereby reflected credit on his medicine, was his unblemished character in private life. He died on the 26th of May, 1623, in the 74th year of his age. Dr. Anthony was twice married, and by his last wife, whose name was Elizabeth, he had two sons, John and Charles, both physicians. The former sold his father's *aurum potable*, and lived by it very handsomely; the latter settled in the town of Bedford, where he attained the character of a learned, honest, and industrious man in his profession.

ANTHONY (St.), was born in Egypt in 251, and inherited a large fortune, which he distributed among his neighbours and the poor, retired into solitude, founded a religious order, built many monasteries, and died anno 356. Many ridiculous stories are told of his conflicts with the devil, and of his miracles: there are seven epistles extant, attributed to him.

ANTICS, in architecture (probably a corruption of *Antiques*), figures of men and animals placed as ornaments to buildings.

ANTI-CHRIST (*Encycl.*). Father Malvenda, a Jesuit, published a large work entitled *Antichristo*, in which this subject is amply discussed. It consists of thirteen books. In the first, he relates all the opinions of the fathers with regard to Antichrist. In the second he speaks of the times when he shall appear; and shews, that all the fathers who supposed Antichrist to be near at hand, judged the world was near its period. In the third, he discourses of his origin and nation; and shews that he is to be a Jew, of the tribe of Dan: this he founds on the authority of the fathers; on the passage in Genesis xlix. 17. *Dan shall be a serpent by the way, &c.*; on that of Jeremy viii. 16. where it is said, *The armies of Dan shall devour the earth*; and on Rev. vii. where St. John, enumerating all the tribes of Israel, makes no mention of that of Dan. In the fourth and fifth books, he treats of the signs of Antichrist. In the sixth, of his reign and wars. In the seventh, of his vices. In the eighth, of his doctrine and miracles. In the ninth, of his persecutions: and in the rest, of the coming of Enoch and Elias, the conversion of the Jews, the reign of Jesus Christ, and the death of Antichrist, after he has reigned three years and an half. See also *Lowman on the Revelation*.

ANTICIRRHA (Strabo); *ANTICYRA* (Pausanias, Stephanus, Livy); a town in Phocis, on the Corinthian bay, opposite to Cirrha, lying to the west, on the same bay. Another *Anticirra*, or *Anticyra*, on the Sinus Maliacus, and near mount Oeta, where grew the best hellebore (Strabo, Stephanus); but which Pausanias ascribes to the *Anticyra* of Phocis: Hence the adage, *Naviget Anticyram* (Horace), used of a person of an unfound mind. The gentilitius name is *Anticyrenus* (Pausanias).

ANTICUS, a term used by the old anatomists, importing, that the part with which it is joined stands before some others: Thus, we meet with *ferratus anticus*, *peroneus anticus*.

ANTIGONUS (*Encycl.*), one of Alexander's commanders, conquered Eumenes, and expelled Seleucus out of Syria; who flying to Ptolemy Lagus in Egypt, a bloody war commenced betwixt him, Cassander, and Antigonus, wherein, by the help of his son Demetrius, Antigonus prevailed, and built the city Antigonis, anno Romæ 448. Afterward Cassander, Seleucus, and Lyfimachus, uniting against him, routed him,

in league with King Pyrrhus, and slew him near Epirus, 301 years before Christ.

ANTIGONUS, king of the Jews, was the son of Aristobolus. He entered into an alliance with the king of the Parthians, and besieged Jerusalem. He cut off his uncle Hircanus's ears, to incapacitate him for the high-priesthood; and put Josephus, Herod's brother, to death. At length, Herod took him and sent him to M. Anthony; who, to gratify Herod, cut off his head, and thereby extinguished the Asmoneans, who had reigned 126 years. This happened 36 years before Christ.

ANTIHECTICUM POTERI, the name of a medicine formerly much celebrated, but now laid aside.

ANTIMETER, or REFLECTING SECTOR, an instrument invented by Mr. Garrard, calculated for measuring small angles with greater accuracy than by the sextant or other instruments commonly used.

The frame of it is similar to that of Hadley's quadrant, having two radii, a limb, and braces; but with this difference, that the further radius is produced upwards of four inches beyond the centre of motion of the index; and the great speculum, or what is called the index-glass in Hadley's quadrant, being placed there is called the *upper centre*. In this instrument there is no provision for the back observation. The horizon-glass is like that in Hadley's quadrant; there are two sight-vanes, to suit two different situations of the large speculum or object-glass: these vanes are adapted to receive a small telescope. On the centre of the index, where the index-glass of Hadley's quadrant is fixed, is a brass or bell-metal femicircle, two inches in diameter, and one-eighth of an inch thick: this femicircle is screwed fast to the index, in such a manner that the axis of the index is a tangent to it. On the upper centre are two circular brass plates, which revolve concentrically, either together or separately. The under plate has a lever, or part perpendicular to the plane of the instrument, projecting downwards, a little beyond the lower centre: this lever is acted upon by the femicircular plate at the lower centre, to which it is always kept close by a spring on the other side. In the upper of the above-mentioned circular plates are two circular perforations or slits, through one of which a screw takes into the head of the instrument, and through the other a screw takes into the lower moveable plate. The large speculum is fastened to the upper plate; and by the above-mentioned screws the position of this glass may be altered. A circular plate is fixed to the lower centre by three pillars: in its centre is a nut to admit a screw, by which the plate carrying the large speculum may be fastened here occasionally.

The scale on the limb is divided into 45 equal parts or degrees, and not into half-degrees as is the case in Hadley's quadrant, by reason of the double reflection. These divisions are numbered in a retrograde order; zero being at the extremity of the further radius. Although the limb contains 45 degrees, yet the greatest angle which can be measured, the large speculum remaining fixed to the circular plate, is $10^{\circ} 18' 21'' .8$; the distance between the two centres being four inches, and the radius of the femicircle one inch. Agreeably to these dimensions, the inventor has given a table exhibiting the value of each primary division on the limb; he hath also given a more ample table, adapted to a distance between the centres of three times the radius of the femicircle, which he says, hath been found the most convenient in practice. If an angle greater than $10^{\circ} 18'$ is wanted, it may be measured by the method of *anticipation*, as the inventor calls it, which is as follows: Let the screw which fastens the two circular plates on the upper centre be made fast, and loosen the screw

which fastens the upper circular plate to the instrument: now adjust the glasses by the usual method: bring forward the index to any given division on the limb, and make it fast; also fasten the screw which was before loose, and loosen the other screw; then bring the index to zero, and proceed as before.

From the inventor we have the following directions for adjusting and using the antimeter.

"The first thing to be attended to is, to set the horizon-glass perpendicular to the plane of the instrument, which is performed as follows: Hold the instrument with its plane perpendicular to the horizon, and look over backwards into the glass and beyond it. If the limb of the instrument appears in a right line with its reflection, the glass is upright; but if it does not appear so, loosen or tighten the little screw on the foot of the glass until it be adjusted; then with the instrument, as in taking an altitude, look through the sight-vane or telescope at some distant object, with the index fixed in any intended situation; the two screws at the upper centre being loose, turn the glass about till the same object appears nearly in the same part of the horizon-glass: next hold it in a horizontal position, and adjust the object-glass or large speculum with the screws which are behind and before, on the foot of it, till the object and its reflection are seen in the same horizontal line. Lastly, with the instrument upright, turn the tangent-screw belonging to the horizon-glass at the back of the instrument, until there be a perfect coincidence of the object and its reflection that way, and the adjustments are complete."

ANTINOUS, the favourite of Adrian, was born at Bithynus in Bithynia. His beauty engaged the heart of Adrian in such a manner, that there never was a more boundless and extravagant passion than that of this emperor toward this youth. After his death, the emperor ordered divine honours to be paid him.

ANTIO, a promontory of Italy, in St. Peter's Patrimony, near which is a harbour, lately made. It takes its name from the ancient city of Antium, the ruins of which extend over a large track of land.

ANTIÖCA, or ANTIOCH, an island in the Mediterranean, near Sardinia, taken from his Sardinian majesty, by the French, in February 1193, but evacuated soon after.

ANTIOCH (*Encyel.*). This city stood on the river Orontes, about twenty miles from the place where it empties itself into the Mediterranean; being equally distant from Constantinople and Alexandria in Egypt, that is, about 700 miles from each. Seleucus Nicator called it *Antioch*, from his father's name, according to some; or from that of his son, according to others. He built sixteen other cities bearing the same name; of which one, situated in Pisidia, is probably that where the name of *Christians* was first given to the followers of Jesus Christ. But that situated on the Orontes, by far eclipsed, not only all the others of this name, but all the cities built by Seleucus. Antigonus, not long before, had founded a city in that neighbourhood, which from his own name he had called *Antigonia*, and designed it for the capital of his empire; but it was razed to the ground by Seleucus, who employed the materials in building his metropolis, and also transplanted the inhabitants thither.

The city of Antioch was afterwards known by the name of *Tetrapolis*, being divided as it were into four cities, each of them being surrounded with its proper wall, besides a common one which inclosed them all. The first of these cities was built by Seleucus Nicator, as already mentioned; the second by those who flocked thither on its being made the capital of the Syro-Macedonian empire; the third by Seleucus Callinicus; and the fourth by Antiochus Epiphanes.—About four

or five miles distant, stood a place called *Daphne*, which was nevertheless reckoned a suburb of Antioch. Here Seleucus planted a grove, and in the middle of it built a temple which he consecrated to Apollo and Diana, making the whole an asylum. To this place the inhabitants of Antioch resorted for their pleasures and diversions; whereby it became at last so infamous, that, "to live after the manner of *Daphne*," was used as a proverb to express the most voluptuous and dissolute way of living. Here Lucius Verus, the colleague of M. Aurelius, chose to take up his residence, instead of marching against the Parthians; while his general Cassius forbade by proclamation any of his soldiers to enter or even go near the place. In short, so remarkable was *Daphne* of old, that the metropolis itself was distinguished by it, and called *Antioch near Daphne*.

Though Antioch continued to be, as Pliny calls it, the queen of the East, for near 600 years; yet scarce any city mentioned in history hath undergone such calamities, both from the attacks of its enemies, and its being naturally subjected to earthquakes.—The first disaster, mentioned in history, which befel the Antiochians, happened about 145 years before Christ: Being at that time very much disaffected to the person and government of Demetrius their king, they were continually raising tumults and seditions; inasmuch that he found himself at last obliged to solicit assistance from the Jews; and was furnished by Jonathan, one of the Maccabees, with 3000 men; by which reinforcement believing himself sufficiently strong to reduce the mutineers by force, he ordered them immediately to deliver up their arms. This unexpected order caused a great uproar in the city. The inhabitants ran to arms, and invested the king's palace, to the number of 120,000, with a design to put him to death. All the Jews hastened to his relief, fell upon the rebels, killed 100,000 of them, and set fire to the city. On the destruction of the Syrian empire by the Romans, Antioch submitted to them as well as the other cities of that kingdom, and continued for a long time under their dominion. About the year 115, in the reign of the emperor Trajan, it was almost entirely ruined by one of the most dreadful earthquakes mentioned in history. Trajan himself happened to be there at that time, being returned from an expedition against the Parthians; so that the city was then full of troops, and strangers come from all quarters either out of curiosity or upon business and embassies: the calamity was by this means felt almost in every province of the Roman empire. The earthquake was preceded by violent claps of thunder, unusual winds, and a dreadful noise under ground. The shock was so terrible, that great numbers of houses were overturned, and others tossed to and fro like a ship at sea. Those who happened to be in their houses were for the most part buried under their ruins: those who were walking in the streets, or in the squares, were, by the violence of the shock, dashed against each other, and most of them either killed or dangerously wounded.—This earthquake continued, with small intermission, for many days and nights; so that vast numbers perished. The most violent shock, according to the Acts of St. Ignatius, was on a Sunday, December 23. By this Trajan was much hurt, but escaped through a window. Dio Cassius pretends, that he was taken out of the window by one who exceeded the human size in tallness. The same historian adds, that mount Liban, which stood at a small distance from the city, bowed with its head and threatened to fall down upon it; that other mountains fell; that new rivers appeared; and others, that had flowed before, forsook their course and vanished. When the earthquake ceased, a woman was heard crying under the ruins; which being immediately removed, she was found, with a living child in her arms. Search was

made for others; but none was found alive, except one child, which continued sucking its dead mother.

No doubt, Trajan, who was an eye-witness of this terrible calamity, would contribute largely towards the re-establishment of Antioch in its ancient splendor. Its good fortune, however, did not continue long; for in 155, it was almost entirely burnt by accidental fire; when it was again restored by Antoninus Pius. In 176 or 177, the inhabitants having sided with Cassius, the above-mentioned Roman general, who had revolted from M. Aurelius, that emperor published a severe edict against them, deprived them of all their privileges, suppressed their public assemblies, and took from them the shows and spectacles to which they were greatly addicted; but his anger being soon appeased, he restored them to their former condition, and even condescended to visit their city. In 194, having sided with Niger against Severus, the latter deprived them of all their privileges, and subjected Antioch as a mere village to Laodicea; but, however, pardoned them the next year, at the entreaties of his eldest son, then a child.

When the power of the Roman empire began to decline, Antioch became the bone of contention between them and the eastern nations; and, accordingly, on the breaking-out of a Persian war, it was almost always sure to suffer. In 242 it was taken and plundered by Sapor; and, though he was defeated by Gordian, it underwent the same misfortune in the time of Valerian, about eighteen years after; and after the defeat and captivity of Valerian, being taken by the Persian monarch a third time, he not only plundered it, but levelled all the public buildings with the ground. The Persians, however, being soon driven out, this unfortunate city continued free from any remarkable calamity till about the time of the division of the Roman empire by Constantine in 331. It was then afflicted with so grievous a famine, that a bushel of wheat was sold for 400 pieces of silver. During this grievous distress, Constantine sent to the bishop 30,000 bushels of corn; besides an incredible quantity of all kinds of provisions, to be distributed among the ecclesiastics, widows, orphans, &c. In the year 347, Constantine II. caused a harbour to be made at Seleucia, for the convenience of Antioch. This was effected at an immense expence, the mouth of the Orontes, where the port was made, being full of sands and rocks. When the emperor Julian set out on his expedition against the Persians, he made a long stay at Antioch; during which time, many of the Roman provinces were afflicted with a famine, but which raged more violently at Antioch than in other places. The ecclesiastic writers of those times say, that this famine followed Julian from place to place; and as he continued longer at Antioch than any other city, it raged more violently there than any-where else. To remedy this evil, Julian fixed the prices of corn, by which means the famine was greatly increased, the merchants conveying their corn privately to other places, so that the metropolis was reduced to a most deplorable situation. In 381, in the reign of Theodosius the Great, Antioch was again visited by a famine, accompanied by a grievous plague. The latter soon ceased; but the famine still continuing, the bishop, Libanius, applied to Icarus, count of the East, requesting him by some means or other to relieve the poor, who had fled from all parts to the metropolis, and were daily perishing in great numbers; but to this Icarus gave no other answer, than that they were abhorred and justly punished by the gods. This inhuman answer raised great disturbances; which, however, were terminated without bloodshed. In 387, Theodosius finding his exchequer quite drained, and being obliged to be at an extraordinary expence in celebrating the fifth year of the reign of his son Arcadius, and the tenth of his own, an extraordinary tax was laid upon

all the people in the empire. Most of the cities submitted willingly to this: but the people of Antioch, complaining of it as an unreasonable oppression, crowded to the house of Flavianus their bishop, as soon as the edict was published, to implore his protection. Being unable to find him, they returned to the forum; and would have torn the governor in pieces, had not the officers who attended him kept back with great difficulty the enraged multitude, till he made his escape. Upon this, they broke some of the emperor's statues, and dragged others through the city, uttering the most injurious and abusive expressions against him and his whole family. They were, however, dispersed by a body of archers, who, by wounding only two of the rabble, struck terror into all the rest. The governor proceeded against the offenders with the utmost cruelty; exposing some to wild beasts in the theatre, and burning others alive. He did not spare even the children, who had insulted the emperor's statues; and caused several persons to be executed, who had been only spectators of the disorder. In the mean time a report was spread, that a body of troops was at hand, with orders to plunder the city, and put all to the sword, without distinction of sex or age; upon which the citizens abandoned their dwellings in the utmost terror and confusion, retiring to the neighbouring mountains with their wives and families. As the report proved groundless, some of them returned; but the greater part, dreading the cruelty of the governor, and the displeasure of the emperor, continued in their retreats. To those who returned, St. Chrysostom preached some Homilies, which have reached our times, and are greatly admired; and which are said by St. Chrysostom himself, as well as some contemporary writers, to have had a considerable effect in reforming the lives of this licentious and dissolute people. On hearing the news of this tumult, Theodosius was so much enraged, that he commanded the city to be destroyed, and its inhabitants to be put to the sword without distinction; but this order was revoked before it could be put into execution, and he contented himself with a punishment similar to that inflicted by Severus above mentioned. He appointed judges to punish the offenders; who proceeded with such severity, and condemned such numbers, that the city was thrown into the utmost consternation. On this occasion, St. Chrysostom and the hermits, who were very numerous in the neighbourhood, exerted all their eloquence in behalf of the unhappy people, and obtained a respite for those who had been condemned. They next proceeded to draw up a memorial to the emperor in favour of the citizens in general; and being joined by Flavianus, at last obtained a general pardon, and had the city restored to all its former privileges.

In the year 458 Antioch was almost entirely ruined by an earthquake, which happened on the 14th of September; scarce a single house being left standing in the most beautiful quarter of the city. The like misfortune it experienced in 525, during the reign of the Emperor Justin; and fifteen years after, being taken by Cosroes king of Persia, that insulting and haughty monarch gave it up to his soldiers, who put all they met to the sword. The king himself seized on all the gold and silver vessels belonging to the great church; and caused all the valuable statues, pictures, &c. to be taken down and conveyed to Persia, while his soldiers carried off every thing else. The city being thus completely plundered, Cosroes ordered his men to set fire to it; which was accordingly done so effectually, that none of the buildings even without the walls escaped. Such of the inhabitants as escaped slaughter were carried into Persia, and sold as slaves.

Notwithstanding so many and so great calamities, the city of Antioch soon recovered its wonted splendor; but in a short time underwent its usual fate, being almost entirely destroyed

by an earthquake in 587, by which 30,000 persons lost their lives. In 634 it fell into the hands of the Saracens, who kept possession of it till the year 853, when it was surprised by one Burtzas, and again annexed to the Roman empire. The Romans continued masters of it for some time, till the civil dissensions in the empire gave the Turks an opportunity of seizing upon it as well as the whole kingdom of Syria. From them it was again taken by the Crusaders in 1098. In 1262 it was taken by Bibaris sultan of Egypt, who put a final period to its glory. It is now only a small and contemptible village, known by the name of *Antakia*; and the name of the river Orontes is changed for that of *Assi*. The walls of each quarter, as well as those which surrounded the whole, are still remaining; but as the houses are entirely destroyed, these quarters look like so many inclosed fields. Its former grandeur, however, appears in the many magnificent ruins that still remain.

ANTIOCHUS THE GREAT, king of Syria, succeeded his brother Seleucus Ceraunus, 223 years before Christ. He was defeated in a bloody battle, by Ptolemy Philopater, near Raphia, 217 years before Christ. Some time after, he took Sardes; attacked the Medes and Parthians; conquered Judea, Phœnicia, and Cœlo Syria; and formed the design of reducing Smyrna, Lampacus, and other cities of Asiatic Greece: These cities implored the assistance of the Romans; who sent ambassadors to oblige him to restore to Ptolemy Philadelphus the countries he had taken from him, and to suffer the free cities of Greece to enjoy the blessings of peace. Antiochus being enraged, at the solicitation of Hannibal declared war against the Romans; but was defeated by Acilius Glabrio, and lost a great battle against Scipio Asiaticus, near Magnesia: in short, the Romans granted him a peace on very disgraceful conditions. At last, finding his exchequer low, and going to recruit it with the plunder of the temple of Belus, he was killed by the rabble, who came to save the sacred treasure, about 187 years before Christ; and was succeeded by Seleucus Philopater.

ANTIOCHUS EPIPHANES, or the *Illustrious*, usurped the throne of Syria from his nephew Demetrius, 175 years before Christ, and attempted to take Egypt from his nephew Ptolemy Philometer; but was repulsed. He deposed Onias, the high-priest of the Jews; and besieged and took Jerusalem, 170 years before Christ, when he prophaned the temple of God, offered sacrifices in it to Jupiter Olympius, carried away the sacred vessels, and committed the most horrid acts of cruelty. At his return to Antioch, 167 years before Christ, he put to death the seven brothers, the Maccabees, with old Eleazar. However, Matthias and Judas Maccabeus defeated his armies; and he himself was routed by the Elymeans, and obliged to return to Babylon, where he was seized with a dreadful disease, and died in the greatest inward agonies, 164 years before the Christian æra. He was succeeded by his son—

ANTIOCHUS EUPATOR, king of Syria, 164 years before Christ. By the advice of Lyfias his son-in-law, he entered Judea, with an army of 80,000 foot, and eighty elephants; but was defeated by Judas Maccabeus. He was killed by Demetrius his cousin-german, 162 years before the Christian æra.

ANTIOPE (*Encycl.*), in fabulous history. Another Antiope was queen of the Amazons; and, with the assistance of the Scythians, invaded the Athenians; but was vanquished by Theseus.

ANTIPAROS (*Encycl.*). This island, according to Heracles Ponticus as quoted by Stephanus, was first peopled by a Phœnician colony from Sidon.—According to Mr. Tournefort's account, it is about sixteen miles in circumference; produces a little wine and cotton, with as much corn as is ne-

cessary for the maintenance of sixty or seventy families, who live together in a village at the end of the island, and are mostly Maltese and French corsairs.

This island is remarkable for a subterraneous cavern or grotto, accounted one of the greatest natural curiosities in the world. It was discovered in the last century by one Magni an Italian traveller. The following account of it appears in the old British magazine, in a letter signed *Charles Saunders*, dated Feb. 24th, 1746-7. He says, "Its entrance lies in the side of a rock, about two miles from the sea-shore; and is a spacious and very large arch, formed of rough and craggy rocks, overhung with brambles and a great many climbing plants, that give it a gloominess which is very awful and agreeable. Our surgeon, myself, and four passengers, attended by six guides with lighted torches, entered this cavern about eight o'clock in the morning, in the middle of August last. We had not gone twenty yards in this cavity, when we lost all sight of day-light: but our guides going before us with lights, we entered into a low narrow kind of alley, surrounded every way with stone all glittering like diamonds by the light of our torches; the whole being covered and lined throughout with small crystals, which gave a thousand various colours by their different reflections. This alley grows lower and narrower as one goes on, till at length one can scarce get along it. At the end of this passage, we were each of us presented with a rope to tie about our middles; which when we had done, our guides led us to the brink of a most horrible precipice. The descent into this was quite steep, and the place all dark and gloomy.

We could see nothing, in short, but some of our guides with torches in a miserable dark place, at a vast distance below us. The dreadful depth of this place, and the horror of the descent through a miserable darkness into it, made me look back to the lane of diamonds, if I may so call it, through which we had just passed; and I could not but think I was leaving heaven to descend into the infernal regions. The hope of something fine at my journey's end, tempted me, however, to let myself down. After about two minutes dangling in this posture, not without much pain as well as terror, I found myself safe, however, at the bottom; and our friends all soon followed the example. When we had congratulated here with one another on our safe descent; I was inquiring where the grotto, as they called it, was. Our guides, shaking their heads, told us, we had a great way to that yet; and led us forward about thirty yards under a roof of ragged rocks, in a scene of terrible darkness, and at a vast depth from the surface of the earth, to the brink of another precipice much deeper and more terrible than the former. Two of the guides went down here with their torches first; and by their light we could see, that this passage was not so perpendicular indeed as the other, but lay in a very steep slant, with a very slippery rock for the bottom; vast pieces of rough rugged rocks jutting out in many places on the right hand, in the descent, and forcing the guides sometimes to climb over, sometimes to creep under them, and sometimes go round them; and on the left, a thousand dark caverns, like so many monstrous wells, ready, if a foot should slip, to swallow them up for ever. We stood on the edge to see these people with their lights descend before us; and were amazed and terrified to see them continue descending till they seemed at a monstrous and most frightful depth. When they were at the bottom, however, they halloed to us: and we, trembling and quaking, began to descend after them. We had not gone thirty feet down, when we came to a place where the rock was perfectly perpendicular; and a vast cavern seemed to open its mouth to swallow us up on one side, while a wall of rugged rock threatened to tear us to pieces on the other. I was quite disheartened at this terrible prospect, and declared I would go back: but still our

guides assured us there was no danger; and the rest of the company resolving to see the bottom now they were come so far, I would not leave them: so on we went to a corner where there was placed an old slippery and rotten ladder, which hung down close to the rock; and down this, one after another, we at length all descended. When we had got to the bottom of this we found ourselves at the entrance of another passage, which was terrible enough indeed; but in this there was not wanting something of beauty. This was a wide and gradual descent; at the entrance of which one of our guides feasted himself on his breech, and began to slide down, telling us we must do the same. We could discover, by the light of his torch, that this passage was one of the noblest vaults in the world. It is about nine feet high, seven wide, and has for its bottom a fine green glossy marble. The walls and arch of the roof of this, being as smooth and even in most places as if wrought by art, and made of a fine glittering red and white granite, supported here and there with columns of a deep blood-red shining porphyry, made, with the reflection of the lights, an appearance not to be conceived. This passage is at least forty yards long; and of so steep a descent, that one has enough to do, when seated on one's breech, not to descend too quickly. Our guides that remained with us, could here keep on each side of us: and what with the prodigious grandeur and beauty of the place, our easy travelling through it, and the diversion of our now and then running over one another whether we would or not; this was much the pleasantest part of our journey. When we had entered this passage, I imagined we should at the bottom join the two guides we had first sent down; but alas! when we were got there, we found ourselves only at the mouth of another precipice, down which we descended by a second ladder not much better than the former. I could have admired this place alone, would my terror have suffered me; but the dread of falling, kept all my thoughts employed during my descent. I could not but observe, however, as my companions were coming down after me, that the wall, if I may so call it, which the ladder hung by, was one mass of blood-red marble, covered with white sprigs of rock crystal as long as my finger, and making, with the glow of the purple from behind, one continued immense sheet of amethysts. From the foot of this ladder we slid on our bellies through another shallow vault of polished green and white marble, about twenty feet; and at the bottom of this joined our guides. Here we all got together once again; and drank some rum, to give us courage before we proceeded any farther. After this short refreshment, we proceeded by a strait, but somewhat slanting passage, of a rough, hard, and somewhat coarse stone, full of a thousand strange figures of snakes rolled round, and looking as if alive; but in reality as cold and hard as the rest of the stone, and nothing but some of the stone itself in that shape. We walked pretty easily along this descent for near 200 yards; where we saw two pillars seemingly made to support the roof from falling in: but in reality it was no such thing; for they were very brittle, and made of a fine glittering yellow marble. When we had passed these about twenty yards, we found ourselves at the brink of another very terrible precipice: but this our guides assured was the last; and there being a very good ladder to get down by, we readily ventured. At the bottom of this steep wall, as I may call it, we found ourselves for some way upon plain even ground; but, after about forty yards walking, were presented by our guides with ropes again; which we fastened about our middles, though not to be swung down by, but only for fear of accidents, as there are lakes and deep waters all the way from hence on the left hand. With this caution, however, we entered the last alley; and horrible work it was indeed to get through it. All was perfectly

Horrid and dismal here. The sides and roof of the passage were all of black stone; and the rocks in our way were in some places so steep, that we were forced to lie along on our backs, and slide down; and so rough, that they cut our clothes, and bruised us miserably in passing. Over our heads, there were nothing but ragged black rocks, some of them looking as if they were every moment ready to fall in upon us: and, on our left hands, the light of our guides' torches shewed us continually the surface of dirty and miserable looking lakes of water. If I had heartily repented of my expedition often before, here I assure you I was all in a cold sweat, and fairly gave myself over for lost; heartily cursing all the travellers that had written of this place, that they had described it so as to tempt people to see it, and never told us of the horrors that lay in the way. In the midst of all these reflections, and in the most dismal part of all the cavern, on a sudden we had lost four of our six guides. What was my terror on this event! The place was a thousand times darker and more terrible for want of their torches; and I expected no other, but every moment to follow them into some of these lakes, into which I doubted not but they were fallen. The remaining two guides said all they could, indeed, to cheer us up; and told us we should see the other four again soon, and that we were near the end of our journey. I don't know what effect this might have upon the rest of my companions; but I assure you I believed no part of the speech but the last, which I expected every moment to find fulfilled in some pond or precipice. Our passage was by this time become very narrow, and we were obliged to crawl on all-fours over rugged rocks; when in an instant, and in the midst of these melancholy apprehensions, I heard a little hissing noise, and saw myself in utter, and not to be described, darkness. Our guides called indeed cheerfully to us, and told us that they had accidentally dropped their torches into a puddle of water, but we should soon come to the rest of them, and they would light them again; and told us there was no danger, and we had nothing to do but to crawl forward. I cannot say but I was amazed at the courage of these people; who were in a place where, I thought, none of them had already perished, and from whence we could none of us ever escape; and determined to lie down and die where I was. Words cannot describe the horror, or the extreme darkness, of the place. One of our guides, however, perceiving that I did not advance, came up to me, and clapping his hand firmly over my eyes, dragged me a few paces forward. While I was in this strange condition, expecting every moment death in a thousand shapes, and trembling to think what the guide meant by this rough proceeding, he lifted me at once over a great stone, set me down on my feet, and took his hand from before my eyes. What words can describe at that instant my astonishment and transport! Instead of darkness and despair, all was splendor and magnificence before me; our guides all appeared about us; the place was illuminated by fifty torches, and the guides all welcomed me into the grotto of Antiparos. The four that were first missing, I now found, had only given us the slip, to get the torches lighted up before we came; and the other two had put out their lights on purpose, to make us enter out of utter darkness into this pavilion of splendor and glory. I am now come to the proper business of this letter; which was, to describe this grotto. But I must confess to you that words cannot do it. The amazing beauties of the place, the eye that sees them only can conceive. The best accounts I can give you, however, pray accept of.

The people told us, the depth of this place was 485 yards. The grotto, in which we then were, is a cavern of 120 yards wide, and 113 long, and seems about sixty yards high in most

places. These measures differ something from the accounts travellers in general give us; but you may depend upon them as exact, for I took them with my own hand. Imagine then with yourself, an immense arch like this, almost all over lined with fine and bright crystallized white marble, and illuminated with fifty-six torches; and you will then have some faint idea of the place I had the pleasure to spend three hours in. This, however, is but a faint description of its beauties. The roof, which is a fine vaulted arch, is hung all over with icicles of white shining marble, some of them ten feet long, and as thick as one's middle at the root: and among these there hang 1000 festoons of leaves and flowers of the same substance; but so very glittering, that there is no bearing to look up at them. The sides of the arch are planted with seeming trees of the same white marble, rising in rows one above another, and often inclosing the points of the icicles. From these trees there also hang festoons, tied as it were from one to another in vast quantities; and in some places among them there seem rivers of marble winding through them in a thousand meanders. All these things are only made, in a long course of years, from the dropping of water, but really look like trees and brooks turned to marble. The floor we trod upon was rough and uneven, with crystals of all colours growing irregularly out of it, red, blue, green, and some of a pale yellow. These were all shaped like pieces of salt-petre; but so hard, that they cut our shoes: among these, here and there, are placed icicles of the same shining white marble with those above, and seeming to have fallen down from the roof and fixed there; only the thick end of these is to the floor. To all these our guides had tied torches, two or three to a pillar, and kept continually beating them to make them burn bright. You may guess what a glare of splendor and beauty must be the effect of this illumination, among such rocks and columns of marble. All round the lower part of the sides of the arch are a thousand white masses of marble, in the shape of oak-trees. Mr. Tournefort compares them to cauliflower, but I should as soon compare them to toad-stools. In short, they are large enough to inclose, in many places, a piece of ground big enough for a bed-chamber. One of these chambers has a fair white curtain, whiter than satin, of the same marble, stretched all over the front of it. In this we all cut our names, and the date of the year, as a great many people have done before us. In a course of years afterwards, the stone blisters out like this white marble over the letters. Mr. Tournefort thinks the rock grows like oaks or apple-trees for this reason; but I remember I saw some of the finest cockle and muscle shells in the rock thereabout that ever I saw in my life. I wonder whether he thinks they grow there too. Besides, if this rock grows so fast, the cavern ought to be all grown up this time; and yet, according to his measures and mine, it seems on the other hand to be grown larger since. Indeed, all that I can gather from his account of this glorious place is, that he had drank a bottle or two too much before he went down into it."

ANTIPATER, the disciple of Aristotle, and one of Alexander the Great's generals, was a man of great abilities, and a lover of the sciences; but was accused of poisoning Alexander. He subdued the revolted Thracians, relieved Megalopolis, and overthrew the Spartans there. He died 321 years before the Christian æra.

ANTIPATER, an Idumean of illustrious birth, and possessed of great riches and abilities, taking advantage of the confusion into which the two brothers Hyrcanus and Aristobulus plunged Judea by their contest for the office of high-priest, took such measures as to gain Hyrcanus that office, and under his government to obtain the absolute direction of all affairs;

while his great abilities and application to business made him so considerable, that he was honoured as much as if he had been invested with the royal authority in form: but he was at last poisoned by a Jew, named Malachus, forty-three years before the Christian era. He left among his other children, the famous Herod king of the Jews.

ANTIPATER (Cælius), a Roman historian, who wrote a history of the Punic war, much valued by Cicero. The emperor Adrian preferred him to Sallust.

ANTIPATER of Sydon, a Stoic philosopher, and likewise a poet, commended by Cicero and Seneca: he flourished about the 17th Olympiad. We have several of his epigrams in the *Anthologia*.

ANTIPATHY (*Encycl.*), in physiology, is, properly speaking, a natural horror and detestation, an insuperable hatred, an involuntary aversion, which a sensitive being feels for some other object, whatever it is, though the person who feels this abhorrence is entirely ignorant of its cause, and can by no means account for it. Such is the invincible aversion of particular persons against cats, mice, spiders, &c.; a prepossession which is sometimes so violent, as to make them faint at the sight of these animals. Of the most common and natural antipathies the ancient naturalists, the schoolmen, and the vulgar, form so many legends; and relate them as certain facts.

To explore the matter without prejudice, we shall find it necessary to abstract from the subjects of this disquisition, 1. All such antipathies as are not ascertained; as that which is supposed to be felt by hens at the sound of an harp whose strings are made of a fox's bowels, between the salamander and tortoise, and between the weasel and the toad. Nothing is less confirmed, or rather nothing is more false, than these facts, with which vulgar credulity and astonishment are amused and actuated: and though some of these antipathies should be ascertained, this would be no proof that the animals which feel them are not acquainted with their causes, according to their mode and proportion of knowledge; in which case, it will be no longer the antipathy which we have defined.

2. We must abstract those antipathies which can be extinguished or resumed at pleasure; these fictitious aversions, which certain persons feel, or pretend to feel, with affected airs, that they may appear more precise and finical, or singularly and prodigiously elegant; that they may seem to have qualities so exquisitely fine, as require to be treated with peculiar delicacy. One who bestows any attention on the subject, would be astonished to find how many of these chimerical aversions there are, which are pretended, and passed upon the world by those who affect them as natural and unconquerable.

3. When we abstract those aversions the causes of which are known and evident; we shall be surprised, after our deduction of these pretended antipathies from the general sum, how small, how inconsiderable, is the quantity of those which are conformable to our definition. Will any one pretend to call by the name of *antipathy*, those real, innate, and incontestable aversions which prevail between sheep and wolves? Their cause is obvious: the wolf devours the sheep, and subsists upon his victims; and every animal naturally flies with terror from pain or destruction: sheep ought therefore to regard wolves with horror, which for their nutrition tear and mangle the unresisting prey. From principles similar to this, arises that aversion which numbers of people feel against serpents; against small animals, such as reptiles in general, and the greatest number of insects. During the credulous and susceptible period of infancy, pains have been taken to impress on our minds the frightful idea that they are venom-

ous; that their bite is mortal; that their sting is dangerous, productive of tormenting inflammations or tumours, and sometimes fatal: they have been represented to us as ugly and forbidding; as being, for that reason, pernicious to those who touch them; as poisoning those who have the misfortune to swallow them. These horrible prepossessions are industriously inculcated from our infancy; they are sometimes attended and supported by dismal tales, which are greedily imbibed, and indelibly engraven on our memories. It has been taught us both by precept and example, when others at their approach have assumed in our view the appearance of detestation and even of terror, that we should fly from them, that we should not touch them. Is it then wonderful (if our false impressions as to this subject have been corrected neither by future reflections nor experiments) that we should entertain, during our whole lives, an aversion from these objects, even when we have forgot the admonitions, the conversations, and examples, which have taught us to believe and apprehend them as noxious beings? and in proportion to the sensibility of our frame, in proportion as our nerves are irritable, our emotions at the sight of what we fear will be more violent, especially if they anticipate our expectation, and seize us unprepared, though our ideas of what we have to fear from them are the most confused and indistinct imaginable. To explain these facts, is it necessary to fly to the exploded subterfuge of occult qualities inherent in bodies, to latent relations productive of antipathies, of which no person could ever form an idea?

It is often sufficient to influence a person who had formerly no aversion for an object, if he lives with some other associate who gives himself up to such capricious panics; the habit is insensibly contracted to be agitated with disagreeable emotions at the presence of an object which had been formerly beheld with indifference and cold blood. I was acquainted (says the author of the article *Antipathy* in the French *Encyclopédie*) with a person of a very sound understanding, whom thunder and lightning by no means terrified; nay, to whom the spectacle appeared magnificent and the sound majestic; yet to a mind thus seemingly fortified against the infectious terror, no more was necessary than spending the summer with a friend in whom the appearance of lightning excited the strongest emotions, and whom the remotest clap of thunder affected with extravagant paroxysms, to become timid in excess at the approach of thunder, nor could he ever afterwards surmount the fear which it inspired.—The frightful stories of dogs and cats, which have killed their masters, or which have given them mortal wounds, are more than sufficient to inspire a timorous person with aversion against these animals; and if the olfactory nerves of such a person be delicate, he will immediately discover the smell of them in a chamber: disturbed by the apprehension which these effluvia excite in his mind, he gives himself up to the most violent uneasiness, which is tranquillized when he is assured that the animal is no longer in the room. If by chance, in the search which is made to calm the uneasiness of this timorous person, one of these creatures should at last be discovered, every one presently exclaims, *A miracle!* and admits the reality of *antipathies* into his creed; whilst all this is nothing but the effect of a childish fear, founded on certain confused and exaggerated ideas of the hazard which one may run with these animals. The antipathy which some people entertain against eels, though they are eaten by others with pleasure, arises from nothing but the fear of serpents, to which these fishes are in some degree similar. There are likewise other antipathies which do not originate in the imagination, but arise from some natural incongruity; such as we often remark in children, for particular kinds of victuals,

with which their taste is not offended, but which their stomachs cannot digest, and which are therefore disgorged as soon as swallowed.

To what then are those antipathies, of which we have heard so much, reducible? Either to legendary tales; or to aversions against objects which we believe dangerous; or to a childish terror of imaginary perils; or to a dislike, of which the cause is disguised; or to a ridiculous affectation of delicacy; or to an infirmity of the stomach; in a word, to a real or pretended reluctance for things which are either invested, or supposed to be invested, with qualities hurtful to us. Too much care cannot be taken in preventing, or regulating, the antipathies of children; in familiarizing them with objects of every kind; in discovering to them, without emotion, such as are dangerous; in teaching them the means of defence and security, or the methods of escaping their noxious influence; and, when the rational powers are matured by age, in reflecting on the nature of those objects which we fear, in ascertaining what has been told concerning their qualities, or in vigorously operating upon our own dispositions to overcome those vain repugnances which we may feel. See SYMPATHY, which is the opposite of *Antipathy*.

ANTIPATHY, in ethics, hatred, aversion, repugnance. *Hatred* is entertained against persons; *aversion*, and *antipathy*, indiscriminately against persons or things; and *repugnance*, against actions alone. *Hatred* is more voluntary than *aversion*, *antipathy*, or *repugnance*. These last have greater affinity with the animal constitution. The causes of ANTIPATHY are less known than those of *aversion*. *Repugnance* is less permanent than either the one or the other.—We hate a vicious character, we feel *aversion* to its exertions: we are affected with ANTIPATHY for certain persons at first sight; there are some affairs which we transact with *repugnance*.—*Hatred* calumniates; *aversion* keeps us at a distance from certain persons; ANTIPATHY makes us detect them; *repugnance* hinders us from imitating them.

ANTIPHLOGISTIC, in chemistry, a term heretofore employed to denote such a state of any body or substance as stood opposed to, or contraindicated the existence of phlogiston in it. See PHLOGISTON. This term is rejected by the new chemists, and bids fair to be exploded with the doctrine which gave it birth. It is often used in medicine merely to denote such a course of remedies as tend to counteract inflammation and heat in the system, or even in a part of the body. Thus we read of *antiphlogistic ointments* which were used in trials by fire, &c. See *Du Cange, gloss.* tom. iii. col. 397. *Henry's Britain*, vol. iii. p. 437.

ANTIRRHUM, a promontory at the mouth of the Corinthian bay, where it is scarce a mile broad, and where it separates the Ætolians from the Peloponnesus; so called from its opposite situation to Rhium in Peloponnesus (Pliny): both are now called the *Dardanelles of Lepanto*.

ANTISTHENES, a Greek philosopher, and founder of the Cynics. He was born at Athens, and passed the former part of his life as a soldier. Having afterwards been an attendant at the lectures of Socrates, he was principally charmed with those exhortations of that great philosopher, which persuaded to frugality, to temperance, and to moderation: these Antisthenes was resolved to practise by carrying every precept to its utmost extent. Permitting therefore his beard to grow, he went about the streets in a thread-bare coat, scarcely to be distinguished from a common beggar. He prided himself upon the most rigid virtue, and thought himself obliged to attack the vicious wherever he found them. This gave him some reputation in the city; but it may be supposed, that, in a place so very luxurious as Athens, he had more enemies

than disciples. His philosophy consisted rather in action than speculation: it was therefore his constant maxim, That to be virtuous was to be happy, and that all virtue consisted in action; that the wife man should live for himself, contented in all situations, and happy alone in the consciousness of his own virtue. He acknowledged nothing to be good but what was honourable; and asserted, that virtue might be acquired by practice. Laertius tells us there were 10 tomes of his works; and he has given us many of his apophthegms.

ANTIUM (Livy), *Antia*, Dionysius Halicarnassæus; a city of the Volsci (Livy); situated on the Tuscan sea, yet without a harbour, because they had a neighbouring hamlet, called *Ceno*, with a harbour (Strabo). The Romans gained their first reputation in naval affairs against the Antiates; part of whose ships they conveyed into the arsenal of Rome, and part they burnt, and with their beaks, or rostra, adorned the pulpit erected in the Forum, thence called *Rostra* (Livy, Florus). Several colonies were successively sent thither (Livy, Tacitus). The epithet is *Antianus*, *Antienfis*, *Antiatinus*, and *Antias-atis*; the people *Antiates*. Here stood a famous temple of Fortune (Horace). Addison says, there were two Fortune worshipped at Antium.—The birth-place of Caligula and Nero (Sueton): but, according to Pliny, the Ambiatinus Vicus was the birth-place of Caligula. It is now extinct, but the name still remains in the *Capo d'Anzo*.

ANTONIA (St.), a town of France, in Rouergue, in the diocese of Rhodéz, whose fortifications are demolished. It is seated on the river Aveiron. E. long. o. 55. N. lat. 44. 10.

ANTONIANO (Silvio), a man of great learning, who raised himself from a low condition by his merit, was born at Rome in the year 1540. When he was but ten years old, he could make verses upon any subject proposed to him; and these so excellent, though pronounced extempore, that even a man of genius could not compose the like without a good deal of time and pains. The duke of Ferrara coming to Rome, to congratulate Marcellus II. upon his being raised to the pontificate, was so charmed with the genius of Antoniano, that he carried him to Ferrara, where he provided able masters to instruct him in all the sciences. From thence he was sent for by Pius IV. who made him professor of the belles-lettres in the college at Rome. Antoniano filled this place with so much reputation, that, on the day when he began to explain the oration *pro Marco Marcello*, he had a vast crowd of auditors, and among these no less than twenty-five cardinals. He was afterwards chosen rector of the college; and after the death of Pius IV. being seized with a spirit of devotion, he joined himself to Philip Neri, and accepted the office of secretary to the sacred college, offered him by Pius V. which he executed for twenty-five years with the reputation of an honest and able man. He refused a bishopric which Gregory XIV. would have given him; but he accepted the office of secretary to the briefs, offered him by Clement VIII. who made him his chamberlain, and afterwards a cardinal. Antoniano killed himself by too great fatigue: for he spent whole nights in writing letters; which brought on a sickness, whereof he died, in the sixty-third year of his age. He wrote with such ease and fluency, that he never almost made any blot or erasure; and it is said of him, that he preserved himself from sexual indulgences during his whole life.

ANTONIDES, VANDER GOES (Joha), an eminent Dutch poet, born at Goes, in Zealand, the 3d of April, 1647. His parents were Anabaptists, people of good character, but of low circumstances. They went to live at Amsterdam when Antonides was about four years old; and, in the ninth year

of his age, he began his studies, under the direction of Hadrian Junius and James Cocceius. Antonides took great pleasure in reading the Latin poets, and carefully compared them with Grotius, Heinsius, &c. By this means he acquired a taste for poetry, and enriched his mind with noble ideas. He first attempted to translate some pieces of Ovid, Horace, and other ancients; and, having formed his taste on these excellent models, he at length undertook one of the most difficult tasks in poetry, to write a tragedy: this was entitled *Brazil*, or *The Invasion of China*. Antonides, however, was so modest, as not to permit it to be published. Vondel, who was then engaged in a dramatic piece, which was taken allo from some event that happened in China, read Antonides's tragedy; and was so well pleased with it, that he declared, if the author would not print it, he would take some passages out of it, and make use of them in his own tragedy. He accordingly did so; and it was reckoned much to the honour of Antonides, to have written what might be adopted by so great a poet, as Vondel was acknowledged to be by all good judges. Upon the conclusion of the peace between Great Britain and Holland, in the year 1697, Antonides wrote a piece, entitled *Bellona a chaind*, i. e. "Bellona chained:" a very elegant poem, consisting of several hundred verses. He next wrote an ingenious heroic poem, which he entitled *The river Y* (the river on which Amsterdam is built).

Antonides's parents had bred him up an apothecary; but his remarkable genius for poetry soon gained him the esteem and friendship of several persons of distinction: and particularly of Mr. Buifero, one of the lords of the admiralty at Amsterdam, and a great lover of poetry, who sent him at his expense to pursue his studies at Leyden, where he remained till he took his degree of doctor of physic, and then his patron gave him a place in the admiralty. In 1678, Antonides married Susanna Bermans, a minister's daughter, who had also a talent for poetry. His marriage was celebrated by several eminent poets, particularly by the famous Peter Franciscus, professor of eloquence, who composed some Latin verses on the occasion. After marriage, he did not much indulge his poetic genius: and within a few years he fell into a consumption, of which he died on the 18th September, 1684, being then but thirty-seven years and a few months old. He is esteemed the most eminent Dutch poet, after Vondel. His works have been printed several times, having been collected by his father Anthony Tanfz. The last edition was printed by Nicholas Ten Hoom, at Amsterdam, in the year 1714, in quarto, under the direction of David Van Hoogstraeten, one of the masters of the Latin school of that city, who added to it also the life of the poet.

ANTONINUS's Wall (*Encycl.*). The first barrier erected by the Romans was the chain of forts made by Agricola from the frith of Forth to that of Clyde, in the year 81, to protect his conquests from the inroads of the Caledonians. The second was the vallum, or dyke, flung up by Adrian in the year 121. It terminated on the western side of the kingdom, at *Axelodunum*, or *Brugh*, on the Solway sands; and was supposed to have reached no further than *Pons Ælii*, or *Newcastle*, on the eastern. But from an inscription lately discovered, it appears to have extended as far as the wall of Severus. This rampart of Adrian's was situated much further south than Agricola's chain; the country to the north having been either, according to some authors, recovered by the native Britons after the departure of Agricola; or, according to others, voluntarily slighted by Adrian. However, this work of Adrian's did not long continue to be the extreme boundary of the Roman territories to the north in Britain. For Antoninus Pius, the adopted son and immediate successor of Adrian,

having, by his lieutenant Lollius Urbicus, recovered the country once conquered by Agricola, commanded another rampart to be erected between the friths of Forth and Clyde, in the tract where Agricola had formerly built his chain of forts. The great number of inscriptions which have been found in or near the ruins of this wall, or rampart, to the honour of Antoninus Pius, leave us no room to doubt its having been built by his direction and command. If the fragment of a Roman pillar with an inscription, now in the college library of Edinburgh, belonged to this work, as it is generally supposed to have done, it fixes the date of its execution to the third consulship of Antoninus, which was A. D. 140, only twenty years after that of Adrian, of which this seems to have been an imitation. This wall or rampart, as some imagine, reached from Caer-ridden on the frith of Forth, to Old Kirkpatrick on the Clyde; or, as others think, from Kinniel on the east, to Dunglass on the west. These different suppositions hardly make a mile of difference in the length of this work, which, from several actual mensurations, appears to have been thirty-seven English or forty Roman miles. Capitolinus, in his life of Antoninus Pius, directly affirms, that the wall which that emperor built in Britain was of turf. This in the main is unquestionably true; though it is evident (from the vestiges of it still remaining, which not very many years ago were dug up and examined for near a mile together) that the foundation was of stone. Mr. Camden also tells us, from the papers of one Mr. Anthony Pont, that the principal rampart was faced with square stone, to prevent the earth from falling into the ditch. The chief parts of this work were as follows: 1. A broad and deep ditch, whose dimensions cannot now be discovered with certainty and exactness, though Mr. Pont says it was twelve feet wide. 2. The principal wall or rampart was about twelve feet thick at the foundation, but its original height cannot now be determined. This wall was situated on the south brink of the ditch. 3. A military way on the south side of the principal wall, well paved, and raised a little above the level of the ground. This work, as well as that of Adrian, was defended by garrisons placed in forts and stations along the line of it. The number of these forts or stations, whose vestiges were visible in Mr. Pont's time, were eighteen, situated at about the distance of two miles from each other. In the intervals between the forts, there were turrets or watch-towers. But the number of these, and their distance from each other, cannot now be discovered.

It is not a little surprising, that though it is now more than 1600 years since this work was finished, and more than 1300 since it was slighted, we can yet discover, from authentic monuments, which are still remaining, by what particular bodies of Roman troops almost every part of it was executed. This discovery is made from inscriptions upon stones, which were originally built into the face of the wall, and have been found in or near its ruins, and are carefully preserved. The number of stones with inscriptions of this kind now extant, is eleven: of which six may be seen at one view in the college of Glasgow, one in the college of Aberdeen, one in the college of Edinburgh, one in the collection of Baron Clerk, one at Cochnoch-house, and one at Calder-house. From these inscriptions it appears in general, that this great work was executed by the second legion, the vexillations of the sixth legion and of the twentieth legion, and one cohort of auxiliaries. If these corps were all complete, they would make in all a body of 7800 men. Some of these inscriptions have suffered greatly by the injuries of time and other accidents; so that we cannot discover from them with absolute certainty, how many paces of this work were executed by each of these bodies of troops. The sum of the certain and probable information contained in

these inscriptions, as it is collected by the learned and illustrious Mr. Horfley, stands thus:

	Paces.
The second legion built	11,603
The vexillation of the sixth legion	7,411
The vexillation of the twentieth legion	7,801
All certain	26,815
The vexillation of the twentieth legion, the monument certain, and the number probable	3,411
The same vexillation, on a plain monument, no number visible, supposed	3,500
The sixth legion, a monument, but no number, supposed	3,000
Cohort prima Cugernorum	3,000
Total	39,726

or 39 miles 726 paces, nearly the whole length of the wall. It would have been both useful and agreeable to have known how long time these troops were employed in the execution of this great work. But of this we have no information. Neither do we know what particular bodies of troops were in garrison in the several forts and stations along the line of this wall, because these garrisons were withdrawn before the *Notitia Imperii* was written.

ANTONIO (Nicholas), knight of the order of St. James, and canon of Seville, did great honour to the Spanish nation by his Bibliothèque of their writers. He was born at Seville, in 1617, being the son of a gentleman whom King Philip IV. made president of the admiralty established in that city in 1626. After having gone through a course of philosophy and divinity in his own country, he went to study law at Salamanca, where he closely attended the lectures of Francisco Romo del Manzano, afterwards counsellor to the king, and preceptor to Charles II. Upon his return to Seville, after he had finished his law-studies at Salamanca, he shut himself up in the royal monastery of Benedictines, where he employed himself several years in writing his *Bibliotheca Hispanica*, having the use of the books of Bennet de la Sana, abbot of that monastery, and dean of the faculty of divinity at Salamanca. In the year 1659 he was sent to Rome by King Philip IV. in the character of agent-general from this prince: he had also particular commissions from the inquisition of Spain, the viceroys of Naples and Sicily, and the governor of Milan, to negotiate their affairs at Rome. The Cardinal of Arragon procured him, from Pope Alexander VII. a canonry in the church of Seville, the income whereof he employed in charity and purchasing of books: he had above 30,000 volumes in his library. By this help, joined to continual labour and indefatigable application, he was at last enabled to finish his *Bibliotheca Hispanica*, in four volumes in folio, two of which he published at Rome in the year 1672. The work consists of two parts; the one containing the Spanish writers who flourished before the 15th century, and the other those since the end of that century. After the publication of these two volumes, he was recalled to Madrid by King Charles II. to take upon him the office of counsellor to the crusade; which he discharged with great integrity till his death, which happened in 1684. He left nothing at his death but his vast library, which he had brought from Rome to Madrid; and his two brothers, and nephews, being unable to publish the remaining volumes of his Bibliothèque, sent them to Cardinal d'Aguirre, who paid the charge of the impression, and committed the care thereof to Monsieur Marii, his librarian, who added notes to them, in the name of the cardinal.

ANTONIUS (Marcus) the triumvir, grandson to the

orator of that name (vide *Encyclop.*), was very handsome in his youth; for which reason he was greatly beloved by Curio a senator, who, by carrying him about in all his debaucheries, made him contract such heavy debts, that his own father forbid him his house. Curio, however, was so generous as to bail him for 250 talents. When the civil war broke out, Curio took Cæsar's party, and prevailed with Antonius to do the same; for which he was made a tribune of the people, and in that office did Cæsar great service. Cæsar, having made himself master of Rome, gave Antonius the government of Italy: at the battle of Pharsalia, Cæsar confided so much in him, that he gave him the command of the left wing of his army, whilst he himself led the right. After Cæsar was made dictator, he made Antonius general of the horse, though he had never been prætor; in which command he exerted his power with the utmost violence. He was made consul, when Cæsar enjoyed that honour for the fifth time, the last year of that usurper's life. On Cæsar's death, he harangued the populace with great art, and raised their fury against his murderers; flattering himself that he should easily get into the place which Cæsar had filled: but his haughty behaviour made him lose all the advantages his affected concern for Cæsar had gained him. His ill treatment of Octavius, and quarrel with him, produced another civil war; which ended in an accommodation between him, Octavius, and Lepidus, fatal to the peace of Rome. They agreed to share the supreme power among them; and many of the most illustrious Romans were sacrificed by proscription to cement this bloody league, which is known by the name of the *Second Triumvirate*. But the triumvirs were too ambitious, and hated one another too much, to be long united. Antonius went into Asia to raise money for his soldiers; during his absence, Fulvia his wife quarrelled with Octavius. When Antonius was in Asia, indulging himself in all manner of luxury, the famous Cleopatra inspired him with the most violent passion. Hearing of the quarrel between Fulvia and Octavius, and finding Octavius was become publicly his enemy, Antonius entered into a confederacy with Sextus Pompeius, who was still master of Sicily. He then went into Italy in order to fight Octavius; but Fulvia, who had been the author and promoter of this war, dying, Octavius and Antonius came to an agreement. One of the conditions of this new peace was, that they should together attack Pompey, though the former had lately made an alliance with him. Antonius then married Octavia, sister to Octavius, as a pledge of their renewed friendship; but returned soon after to his beloved Cleopatra, and again lived with her in Alexandria. Octavius took hold of this pretence to inveigh against him, and begin the war again. At last they engaged in a sea-fight at Actium, in which Octavius gained a complete victory; which was followed by the deaths both of Antonius and Cleopatra. The infuriated Antonius fell upon his own sword; and Cleopatra stung herself to death with an asp, as was supposed, to avoid gracing the victor's triumph at Rome.

ANXUR, a city of the Volsci (Pliny, Livy), in Latium; called *Tarracina*, by the Greeks and Latins: *novi Terracina*; situated on an eminence (Livy, Horace, Sil. Italicus). *Anxurus*, a citizen of Anxur (Livy). And the epithet, *Anxurus*, a name of Jupiter, worshipped without a beard at Anxur (Virgil). Though others read *Anxurus*, or *Axyrus*, without a razor. E. Long. 14. 5. Lat. 41. 18.

ANZERMA, a town and province of Poypayan, in South America, where there are mines of gold. The town is seated on the river Coca. Long. 75. 25. W. Lat. 4. 58. N.

AORNUS (*Encycl.*). This rock was taken by Alexander the Great, in whole time there was a report that Hercules had attempted it in vain; however, according to Arrian, this

report was without foundation. It is probable indeed, that it was raised after the place was taken, in order to magnify Alexander's exploit. While the Macedonian monarch was preparing all things necessary for the siege, an old man with his two sons, who had long lived in a cave near the summit, came and offered to shew him a private way of ascending. This being readily accepted, Ptolemy, with a considerable body of light-armed troops, was dispatched with them, with orders, in case they succeeded, to entrench themselves strongly upon the rock, in the wood to which the old man was to direct them, before they ventured to attack the Indians. Ptolemy exactly executed his orders; and gave notice by a lighted torch set upon a pole, that he had got safely up. Upon this, Alexander gave immediate orders for a body of troops to attempt the passage by which the rock was commonly ascended; but they were repulsed with great slaughter. He then sent an Indian with letters to Ptolemy, desiring him, the next time an attack was made by the common way, to fall upon the enemy behind. But in the mean time, those who defended the rock attacked Ptolemy with great vigour; but were at last repulsed, though with much difficulty: but the next day, when Alexander renewed the attack, though Ptolemy attacked the Indians in the rear, the Macedonians were repulsed on both sides. At last the king, perceiving that the strength of the Indians lay in the straitness and declivity of the way by which they were attacked, caused a great quantity of trees to be felled, and with them filled the cavities between the plain on which the Indians were encamped, and the highest of his own advanced posts. The Indians at first derided his undertaking; but at length perceiving the ardour with which the work was carried on, and having felt the effects of the missile weapons of the Macedonians, they sent deputies to propose terms of capitulation. Alexander, suspecting that their design was only to amuse him till they made their escape, withdrew his guards from the avenues. As soon as he knew the Indians were descended, he, with 700 of Ptolemy's light-armed foot, took possession of the deserted rock, and then made a signal for his forces to fall upon the flying Indians. They setting up a loud shout, so terrified the fugitives, that numbers of them fell from the rocks and precipices, and were dashed to pieces, while the greatest part of the remainder were cut off in the roads.

APALACHIAN MOUNTAINS (*Encycl.*). A great part of these mountains are covered with rocks, some of which are of a stupendous height and bulk; the soil between them is generally black and sandy, but in some places differently coloured, composed of pieces of broken rock and spar, of a glittering appearance, which seem to be indications of minerals and ores if proper search was made for them. Chestnuts and small oaks are the trees that principally grow on these mountains, with some *chinkapin* and other small shrubs. The grass is thin, mixed with vetch and small pease; and in some places there is very little vegetable appearance.

The rocks of the Apalachian mountains seem to engross one half of the surface. They are mostly of a light grey colour: some are of a coarse-grained marble like alabaster; others, of a metallic lustre: some pieces are in the form of slate, and brittle; others in lumps, and hard: and some appear with spangles, or covered over with innumerable small shining specks, like silver. These frequently appear at the roots of trees when blown down. The different spars are found most on the highest and steepest parts of the hills, where there is little grass and few trees; but the greatest part of the soil between the rocks is generally a dark sandy-coloured kind of mould, and shallow; yet fertile, and productive of good corn, which encourages the Tallipooses, a clan of the Cherokee Indians, to settle among them in latitude 34°; and

they are the only Indian nation that has a constant residence upon these mountains.

APAMEA, or **APAMIA**, a city of Bithynia, formerly called *Myrlea*, from Myrlos, general of the Colophonians: destroyed by Philip, father of Perseus; and given to his ally Prusias, who rebuilt it, and called it *Apamea*, from the name of his queen Apama (Strabo). Stephanus says, that Nicomedes Epiphanes, son of Prusias, called it after his mother; and that it had its ancient name from Myrlea, an Amazon. The Romans led a colony thither (Strabo); called *Colonea Apamena* (Pliny, Appian). The gentilitive name is *Apameus*, and *Apamenus* (Trajan in a letter to Pliny).—Another *Apamea*, called *Cibotos*, of Phrygia, at some distance from the Meander (Agathodæmon); but by a coin of Tiberius, on the Meander. The name is from Apame, mother of Antiochus Soter, the founder, and the daughter of Artabazus (Strabo). The rise, or at least the increase, of Apamea, was owing to the ruins of Celenæ. The inhabitants are called *Apamienes* (Tacitus).—A third, on the confines of Parthia and Media, furnished *Raphane* (Strabo, Pliny).—A fourth *Apamea*, a town of Mesene, an island in the Tigris (Pliny, Ammian); where a branch of the Euphrates, called the *Royal river*, falls into the Tigris (Ptolemy). A fifth in Mesopotamia, on the other side the Euphrates, opposite to Zeugma on this side, both founded by Seleucus, and joined by a bridge, from which the latter takes its name (Pliny, Isidor, Characenus).—A sixth *Apamea*, now *Afania*, also in Syria, below the confluence of the Orontes and Marfyas; a strong city, and situated in a peninsula, formed by the Orontes and a lake: it was a place of such plenty, that Seleucus, the founder of it, there maintained 500 elephants (Strabo).—*Apamea* was also the ancient name of *Pella*, in the Decapolis.

APEE, one of the New Hebrides, in the South Sea, near Mallicoli. Long. 168. 32. E. Lat. 55. 6. N.

APERTURE (*Encycl.*). When water issues from a small aperture in the bottom or side of a vessel, which is kept constantly full, it has been supposed, that the force accelerating the lowest plate of water, of indefinitely little altitude, immediately over the orifice, is the weight of the incumbent water only; and, therefore, that after the motion of the plate has once commenced, the pressure of the incumbent column will be diminished, and of consequence the force accelerating the plate, during its descent through its own altitude, will not be constant.

But, in fact, it is not the pressure of the incumbent water, which accelerates the lowest plate; for every plate of water immediately incumbent over the hole, abstracting from all lateral pressure, begins to be accelerated equally at the same moment; and therefore the incumbent column, exclusive of any lateral pressure, could produce no increase of velocity, in proportion to its increased height. The force which really accelerates the issuing plate, is the pressure of the ambient water, which surrounds the cylinder immediately over the aperture; and this lateral pressure being communicated to the upper surface of the plate, must be as much increased by the velocity of the superior descending plate, as it is diminished by that of the inferior issuing plate, so as to remain constantly of the same magnitude.

On this principle it can be easily demonstrated, that the velocity with which water spouts from an aperture in the bottom or side of a vessel, is equal to that which a heavy body would acquire in falling through the height of the fluid above the orifice.

This demonstration, however, as Mr. Atwood observes, is true only on the hypothesis that the water suffers no resistance, but issues in a cylindrical or prismatic form corresponding to the hole. But, in fact, the velocity of the water according to

theory will be diminished by the friction of the particles against the edges of the orifice, from their mutual attraction, by which the issuing particles are retarded by those which are still in the vessel, and have not acquired the velocity of those which precede them, but principally from the obliquity of their motions.

For, as Chev. Du Buat observes, when water issues from an orifice, the particles will flow from all sides, towards the orifice, with an accelerated motion, and in all directions. If the orifice be horizontal, that filament of particles which answers to the centre of the hole will descend in a vertical line, and will suffer no other resistance than that of the friction caused by the excess of its velocity above that of the collateral filaments, or by the retardation which arises from the attraction subsisting between them. The other filaments, after they have descended vertically for some time, are compelled to turn from their vertical course, and to approach the orifice in different curves; and when they arrive at it, their directions become more or less horizontal, according as they pass nearer to or farther from the edge of the orifice. The motion thereof is decomposed according to two directions, the one horizontal, which is destroyed by the equal and contrary resistance of the filaments which are diametrically opposite; the other vertical, in proportion to which the quantity of water discharged is to be estimated. Hence we see, that the vertical velocity of the filaments decreases from the centre of the orifice to its circumference; and that the total discharge is less than if all the filaments had issued vertically in the same manner with that which answers to the centre of the aperture. It also follows, that the filaments which are nearer to the centre, moving faster than those which are nearer to the edges, the vein of the fluid, after it has issued from the orifice, will form a cone whose base is the orifice; that is to say, that its diameter will diminish, at least, to a certain distance, because the exterior filaments are gradually drawn on, in consequence of their mutual attraction, by the interior filaments whose velocity is greater; whence there follows a diminution in the diameter of the vein.

This manner of accounting for the contraction of the vein seems more reasonable than that which is given by Newton; as there appears to be no adequate cause for the acceleration of the water, after it has been discharged from the orifice.

The diminution of the mean velocity of the water, caused solely by the obliquity of the motions of the issuing particles, exclusive of any other impediment, may be thus determined:

Let $m n$ (fig. 1. Pl. II.) be the diameter of the aperture in the vessel $A B D C$ filled with water: in whatever direction the water issues, its velocity in that direction will, in all cases, be the same, because the pressure of fluids is the same in all directions; thus, whether a fluid spouts perpendicularly upwards or downwards, horizontally or obliquely, the space through which it is projected, in a given time, is the same. Now to determine this direction, since the horizontal and vertical pressures are equal, the issuing particles will assume the intermediate direction, which will therefore form an angle of 45° with the plane of the orifice: its vertical velocity therefore will be less than its direct or total velocity in the proportion of the diagonal of a square to its side, or as 7 to 5 nearly; but the particles of the central filament issue with the full velocity due to the entire height of the water; therefore the velocity of the central particles will be to the mean velocity as 7 to the mean between 7 and 5, or as 7 to 6. This is the diminution, as has been said, which takes place in consequence solely of the obliquity of the motions with which the particles issue from the orifice: if the other causes of retardation be taken into the account, we may conclude, that the velocity should be diminished perhaps in the ratio of 8 or even 9 to 6; which accords very well with experiments. Thus Polenus makes the ratio

of the diameters of the contracted vein and aperture, which is the same with that of the mean and greatest velocity, to be as $5\frac{1}{2}$ to $6\frac{1}{2}$; Bernouilli 5 to 7; Chev. Du Buat 6 to 9. When the orifice is infinitely little, the cylinder of issuing water becomes a single filament, which is therefore discharged without any obliquity, and there will be no diminution of velocity, except such as arises from friction and the tenacity of the particles. If the aperture be increased so as to become equal to the base of the vessel, the column of water will then descend like a falling body, and therefore the velocity will be the same as before; but it will not acquire this velocity until the uppermost plate of water has been discharged. At the beginning of the motion, the first or lowest plate will flow out with a velocity indefinitely little; the next plate with a greater velocity; and so on, until the upper plate shall have descended to the orifice, which will then issue with the greatest velocity. But if the vessel be supposed to be kept constantly full, the velocity of the effluent water will increase so as at length to become equal to that which a heavy body would acquire in falling from an infinite height.

Since the middle filament of particles is discharged with the full velocity due to the entire altitude of the fluid above the orifice, experiments made on the distance or height to which fluids spout, will be found to agree very well with theory, but it by no means follows, that all the filaments should be discharged with the same velocity: the quantity of the fluid therefore discharged in a given time, may be less than that which would be discharged, if all the filaments were discharged with the velocity due to the entire altitude; because this quantity depends on the mean velocity of all the filaments. Hence, therefore, it cannot be inferred from these experiments, compared with those which relate to the height or distance to which the fluid spouts, that the velocity of the water in the orifice is less than that which is due to the entire altitude: and that it is accelerated immediately after it gets out of it; because the distance to which the fluid spouts depends on the central filament only; but the quantity discharged on the mean velocity of the whole.

“To bring this question to the test of experiment” (says the Rev. Dr. Matthew Young, from whose paper in the Transactions of the Royal Irish Academy we quote), if all the particles were equally accelerated at their discharge from the orifice, and immediately after they leave it, they ought all to be projected horizontally to the very same distance upon an horizontal plane; but on experiment I found, that when the fluid spouted through an orifice of .08 of an inch diameter, and was kept constantly at the same height, the greatest and least distances at which it struck the horizontal plane were nearly 15 and 12 inches; but these distances are proportional to the velocities with which they are discharged. It follows, therefore, that all the particles are not projected with the same velocity. It is to be observed, that the particles which are discharged with the greatest and least velocities are few in comparison of those which are discharged with intermediate velocities, for while the entire shower extended from 15 to 12 inches on the horizontal plane, the denser part was found to occupy only the space between $14\frac{1}{2}$ and $12\frac{1}{2}$ inches; so that the limits of the velocities of the parts of the denser shower were as 7 and 6.26; but the limits of the whole were 15 and 12, or as 7 and 5.6; and the limits by theory are as 7 and 5. But we may perceive, that when the fluid spouts horizontally, the particles which issue from the upper part of the aperture, and which therefore ought to move with the least velocity, must encounter those below them moving with a greater velocity, which will increase the distance to which they are projected on an horizontal plane. Likewise, the particles which issue from the lowest part of the orifice, and which ought to move with

als velocity, than that with which those in the axis move, in the ratio of 5 to 7, will have their velocity increased by their being at a greater depth. The limit therefore of the ratio of the distances to which the particles are projected on an horizontal plane, must be less than that which results from the theory of water-issuing through an horizontal aperture. But it is obvious that the greater depth of the lower particles, when the orifice is vertical, cannot account for the entire difference of distance to which the particles are projected; for the depth of the orifice being 8.55 inches, and the diameter of the orifice .08 of an inch, the velocities on account of the difference of depth would be only as $\sqrt{8.55}$ to $\sqrt{8.63}$, or as 14.6 to 15 nearly. Perhaps it might be said, that this difference of distance was caused, not by the different velocities, but by the different directions in which the particles are discharged; so that those which are projected in the axis of the vein, will strike the horizontal plane at a greater distance than those which are projected from the edges of the orifice with the same velocity, but in a different direction. But this cannot be the cause; for when the aperture is horizontal, the particles which issue from the opposite sides m, n , of the orifice (fig. 2.), meeting each other, destroy their convergence, and afterwards proceed in the direction of the axis of the vein, and therefore the vein will continue nearly of the same diameter; whereas, if the particles crossed each other, with the same velocity, in different directions, they would describe intersecting parabolas m, s, m, t , and the diameter of the vein would continually increase. In order to determine whether this were the case, I caused the fluid to issue through an aperture in the bottom of the vessel, and at the distance of 12 inches I found the diameter of the vein a little increased, when the velocity of the efflux was considerable; but not sensibly augmented, when the velocity was much diminished. Since the dilatation of the vein in this case depends on the velocity with which the water issues from the aperture, it is to be inferred, that it is caused by the resistance of the air, which producing a retardation of the preceding particles, those which follow impinge against them, and the thickness of the vein is increased; for the same reason as when the jet is made perpendicularly upwards, a broad head is formed in consequence of the retardation of the uppermost particles. Now, since it appears that the dilatation of the vein which arises either from the different directions of the particles, or the resistance which they undergo from the air, or both together, cannot account for the difference of distance to which the particles are projected on an horizontal plane, we must conclude that this difference is caused by the different velocities with which they escape from the orifice.

When a tube $m n r s$ (fig. 3.) is inserted into the vessel $A B C D$, it is found, that the velocity is increased nearly in the sub-duplicate ratio of the length of the pipe, when the tubes are short; and that it approaches nearer to that sub-duplicate ratio, according as the length of the pipe is increased. To account for this increase of velocity has appeared a matter of some difficulty, since the water cannot issue at $r s$ with a greater velocity than it enters at $m n$; and it does not appear how the velocity at $m n$ can be increased by inserting a tube beneath it. In order to explain the cause of this effect, we are to consider, that the whole force with which the plate $m n$ is pressed down is the weight of a column of water equal to $e m n f$, together with the weight of a column of air of the same base, reaching to the top of the atmosphere; and the whole force with which it is pressed up is the weight of an equal column of air, diminished by the weight of a column of water equal to $m n r s$; therefore the actual force with which the plate $m n$ is pressed down is the weight of a column of water equal to $e f r s$; the velocity therefore with which the plate $m n$ will issue through the orifice $m n$ will be the same as

through the orifice $r s$ in the vessel $A B C D$; that is, equal to the velocity which a heavy body would acquire in falling through the altitude $e r$; and all the plates of water in the tube $m n r s$ will descend with the same velocity; for they cannot descend faster, because otherwise there would be a vacuum left in the tube, which is prevented by the upward pressure of the atmosphere. And the velocity of the effluent water will be the same, whatever be the pressure of the atmosphere, provided the weight of a column of air of the same base with $r s$, and whose height is equal to that of the atmosphere, be either greater than or equal to the weight of the pillar of water $m n r s$. This might be proved experimentally by a vessel of water with a pipe inserted in the bottom, placed under an exhausted receiver. But as the operation of exhaustion is obstructed more by the evaporation of water than of mercury, it will be better to use mercury in these experiments. Now, if D be the defect of the gauge from the standard altitude, it will measure the pressure of the air on the surface of the mercury in the vessel: Let A be the altitude of the mercury in the vessel above the upper orifice of the pipe, and P the length of the pipe; then the whole force pressing downwards the plate of mercury which is immediately in the upper orifice of the pipe, will be $= D + A$; and the whole force pressing the same plate upwards will be $D - P$; and the difference between these forces will be the absolute force pressing the same plate of mercury downwards; while D is greater than P , this absolute force will consequently be equal to $A + P$; when $D = P$, $D - P$ vanishes, and the force pressing the plate downwards is $= D + A = P + A$; hence, therefore, no variation in the time of the efflux will be perceived, while the altitude of the mercury in the gauge is equal to or less than the difference between the length of the pipe and the standard altitude. When D is less than P , the force upwards is also nothing; and therefore, as before, the whole force pressing the plate downwards is $= D + A$; and A being given, it decreases according as D decreases; and when D vanishes, that is, when the receiver is absolutely exhausted, the force becomes equal to A , and the time of the efflux will be the same as if the pipe had not been inserted in the bottom of the vessel. To try the truth of these things by experiment, I inserted a tube 7.8 inches long in a cylindrical vessel, and closing the orifice of the pipe, I filled the vessel with mercury to the height of 6 inches; then placing the apparatus under the receiver of an air-pump, when the barometer was at 30 inches, and the gauge at 28.5, the time of the efflux was 26 seconds: when the experiment was repeated precisely in the same manner, but in the open air, the time of the efflux was only 10 seconds. Now, as the gauge stood at 28.5, the defect D was $30 - 28.5 = 1.5$, and the pressure on the plate of mercury was $= 6 + 1.5 = 7.5$; in the open air the pressure was $= 6 + 7.8 = 13.8$; therefore the ratio of the velocity of the efflux in both cases, which is the same with the reciprocal ratio of the times, was $\sqrt{7.5}$ to $\sqrt{13.8}$, or as 2.73 to 3.7; but 2.73 is to 3.7 as 10 to 26 very nearly. No difference was observed in the times of the efflux, when in the open air and exhausted receiver, unless the gauge stood higher than 22.5 inches; that is, unless the height of the mercury in the gauge was greater than the difference between the length of the pipe and the standard altitude. In another experiment, when the gauge stood at 27.9, the height of the barometer was 29.9; the defect therefore was $= 2$, and the pressure $= 8$. But $\sqrt{8} = 2.828$, and $\sqrt{13.8} = 3.7$ but $2.828 : 3.7 :: 10 : 24$, and by experiment the time of the efflux appeared to be 23 seconds. When the efflux is made in vacuo; it is obvious to observe, that the pipe is not filled during the efflux, as it is while the discharge is made in the open air.

“ Since the column of water in the pipe $m n r s$ adds to

the pressure which the plate $m n$ sustains, by diminishing the upward pressure of the air through the pipe, it appears that it produces this increase of pressure in the plate $m n$ alone, without producing any lateral pressure in the water which is on a level with $m n$; for it is manifest, that if an aperture were made in $m B$ or $n C$, the velocity of the water issuing through it would not be affected by the insertion of the pipe; and consequently that the plate $m n$, which is immediately in the orifice of the pipe, is the only one, on the same level, whose tendency downwards is increased by the insertion of the pipe. Hence, the particles of water at the edge of the aperture, having their perpendicular pressure increased by the weight of the column $m n r s$, without any increase of their lateral pressure, they will issue through the orifice $m n$ more perpendicularly; the sides also of the tube will obstruct the converging motion of the particles, and consequently, on both these accounts, the quantity of water discharged through a pipe thus inserted will exceed that discharged through a simple orifice, in a greater ratio than the sub-duplicate of the height of the water. And according as the length of the pipe increases, the ratio of the quantity of water actually discharged by experiment, to that which should be discharged according to theory, will increase; because the ratio of the perpendicular to the horizontal pressure increases, in the ratio of the sum of the depth of the vessel, and length of the pipe, to the depth of the vessel. It follows therefore, that experiments made in this manner, will approach nearer to coincidence with theory, than when made with a simple orifice; except either when the tube is so long as that the friction of the fluid against the sides of the tube shall produce a sensible effect, or when it is so short, as not to be sufficient to give the particles a vertical direction. All which agrees very well with the experiments made by the ingenious Mr. Vince, of which he has given us an account in the Phil. Trans. for the year 1795. Thus he tells us, that having inserted a tube, a quarter of an inch in length, into a cylindrical vessel 12 inches deep, he found that the velocity did not sensibly differ from that through the orifice; the cause of which he discovered to be this, that the stream did not fill the pipe, but that the fluid was contracted, as when it flowed through the simple orifice. When the pipe was half an inch long, inserted into a vessel of the same depth as before, the velocity of the water from the pipe and from the orifice, which ought by theory to have been as $\sqrt{12.5}$ to $\sqrt{12}$, or as 49 to 48, was by experiment found to be nearly in the proportion of 4 to 3. Now if the ratio of 49 to 48 be increased in the ratio of 7 to 6 (because this is the ratio of the diminution of the velocity on account of the contraction of the vein, and this contraction either nearly or entirely vanishes in a pipe), we shall have the ratio of 3.57 to 3. When the pipe was an inch long, the velocity from the pipe and from the orifice, which, according to theory, ought to have been as $\sqrt{13}$ to $\sqrt{12}$, or as 26 to 25, appeared by experiment, very nearly in the ratio of 4 to 3; now if the ratio of 26 to 25 be increased in the ratio of 7 to 6, we shall have the ratio of 3.64 to 3. When he made use of longer pipes, the velocity of the effluent water by experiment approached nearer to that which ought to have been discharged according to theory; so that in long pipes the difference between theory and experiment, he says, was not greater than what might be expected from the friction of pipes, and other causes which may be supposed to retard the velocity. When he inserted a pipe of the same diameter with the aperture, which terminated in a truncated cone fixed in the orifice (fig. 4. see the Philosophical Transactions for the year 1795), he expected, that the quantity of water discharged in a given time would have been diminished, because the water, issuing through the orifice $m n$, would have

room to form the *vena contracta* in the enlarging cone; but he found, that the same quantity of water was discharged, as if the pipe had continued throughout of the same diameter with the orifice. The reason of this is manifest from what has been said, for the pressure of the air will not suffer the truncated cone to remain partly empty, as it would be if the *vena contracta* were formed; it will therefore continue full, and consequently the water will pass through it in the same manner as if the water in the cone, surrounding the pipe $m a b n$, were congealed."

Mr. Vince likewise inserted into the bottom of the vessel a perpendicular pipe, in form of a truncated cone, the narrower part being fixed in the orifice; by which he found the efflux to be increased more than if he had inserted a cylindrical pipe of the same length, whose diameter was equal to that of the narrowest part of the conical pipe. This effect may be explained on the same principle by which we accounted for the augmentation of the diameter of a vertical vein of water, through a simple orifice, when the velocity of the efflux is considerable. For when a perpendicular pipe is inserted, the velocity of the discharge being considerably increased, the resistance from the air will be so likewise; and thus the diameter of the vein has a tendency to enlarge itself; now in the widening cone, the pipe admits of this augmentation, at the same time that it increases the velocity; but the cylindrical pipe, though it equally increases the velocity, yet it does not permit the vein to enlarge itself, and by thus confining it, the efflux is obstructed, and the quantity discharged in a given time is diminished. Accordingly, under the receiver of an air-pump, even in a moderate degree of exhaustion, there is no difference perceived between the velocities with which a fluid is discharged through a conical or cylindrical pipe.

APHACA, the name of a place in Syria, situated between the Heliopolis and Byblus, near Lebanon (Zotimus); infamous for a temple of Venus, called *Aphacitis*, near which was a lake, round which fire usually burst forth, and its waters were so heavy, that bodies floated on them. The temple was destroyed by Constantine, as being a school of incontinence (Eusebius). The name is of Syriac origin, signifying *embraces*.

APHRODISIAS, an island on the coast of Carmania (Pliny); sacred to Venus (Arrian). Another island on the coast of Cyrene, with a road for ships (Scylax); called *Laea*, or the island of Venus (Ptolemy).

APHRODISIUS, an inland city of Caria, called the *Metropolis* (Ptolemy, Stephanus); said by Suidas to have been called *Nimæ*. Another of Cilicia (Ptolemy); so called from the worship and a temple of Venus (Pliny). A third of Thrace, to the north of the isthmus of the Chersonesus; an open town, till formerly fortified by Justinian (Procopius).

APIYTIS, a town of the Chersonesus, called *Pallare*, in Macedonia (Pliny); famous for an oracle of Apollo.

APINA, or *Apina*, a town of Apulia, built by Diomedes, as was also *Trice* (Pliny). *Apina* and *Trice* is a proverbial saying for things trifling and of no value (Martial); and *Apinari* was the appellation for triflers or buffoons (Trebellius Pollio).

APION, a famous grammarian, born in Egypt, was a professor at Rome in the reign of Tiberius. He had all the arrogance of a mere pedant, and amused himself with difficult and insignificant enquiries. One of his principal works was his *Antiquities of Egypt*.

APOBATANA, the metropolis of Media, and where the kings kept their treasure (Isidorus Characenus); supposed to be the same with *Schatana*.

AOBATHRA, a place near Sestos (Strabo); the landing place where Xerxes's ships were frozen, and stuck in the ice (Eustathius).

APOCALYPSE (*Enceyl.*). This book consists of twenty-two chapters. The three first are an instruction to the bishops of the seven churches of Asia Minor. The fifteen following chapters contain the persecutions which the church was to suffer from the Jews, heretics, and Roman emperors. Next, St. John prophesies of the vengeance of God, which he will exercise against those persecutors, against the Roman empire, and the city of Rome, which, as the Protestants suppose, he describes under the name of Babylon, the great whore, seated upon seven hills. In the last place, the 19th, 20th, 21st, and 22d chapters, describe the triumph of the church over its enemies, the marriage of the Lamb, and the happiness of the church triumphant.

It is a part of this prophecy (says Sir Isaac Newton), that it should not be understood before the last age of the world; and therefore it makes for the credit of the prophecy, that it is not yet understood. The folly of interpreters has been to foretell times and things by this prophecy, as if God designed to make them prophets. By this rashness they have not only exposed themselves, but brought the prophecy also into contempt. The design of God was much otherwise: he gave this and the prophecies of the Old Testament, not to gratify men's curiosities, by enabling them to foreknow things; but that, after they were fulfilled, they might be interpreted by the events; and his own providence, not the interpreters, be then manifested thereby to the world. And there is already so much of the prophecy fulfilled, that as many as will take pains in this study, may see sufficient instances of God's providence.

APOLLINARIS (Caius Sulpicius), a very learned grammarian, born at Carthage, lived in the 2d century, under the Antonines; he is supposed to be the author of the verses which are prefixed to the comedies of Terence, and contain the arguments of them. He had for his successor in the profession of grammar Helvius Pertinax, who had been his scholar, and was at last emperor.

APOLLINARIS SIDONIUS (Caius Sollius), an eminent Christian writer and bishop in the 5th century, was born of a noble family in France. He was educated under the best masters, and made a prodigious progress in the several arts and sciences, but particularly in poetry and polite literature. After he had left the schools, he applied himself to the profession of war. He married Pappianilla, the daughter of Avitus, who was consul, and afterwards emperor, by whom he had three children. But Majorianus in the year 457 having deprived Avitus of the empire, and taken the city of Lyons, in which our author resided, Apollinaris fell into the hands of the enemy. However, the reputation of his learning softened Majorianus's resentment, so that he treated him with the utmost civility, in return for which Apollinaris composed a panegyric to his honour; which was so highly applauded, that he had a statue erected to him at Rome, and was honoured with the title of *Comit*. In the year 467 the Emperor Anthemius rewarded him for the panegyric, which he had written in honour of him, by raising him to the post of governor of Rome, and afterwards to the dignity of a patrician and senator, and erecting a statue to him. But he soon quitted these secular employments for the service of the church. The bishopric of Clermont being vacant in 472 by the death of Eparchius, Apollinaris, who was then only a layman, was chosen to succeed him without any interest or solicitations on his part, in which see he acted with the greatest integrity. Clermont being besieged by the Goths, he animated the people to the defence of that city, and would never consent to the surrender of it; so that, when it was taken about the year 480, he was obliged to retire; but he was soon restored by Evariges king of the Goths, and continued to govern the church as he had done before. He died in peace the 21st of August, 487, and

his festival is still observed in the church of Clermont, where his memory is had in great veneration. He is esteemed the most elegant writer of his age, both in prose and verse. He wrote a great many little pieces; but preferred none but those which he thought were worthy of being continued down to posterity. He collected himself the nine books which we have remaining of his letters. His chief pieces in poetry are the three panegyrics upon the emperors Avitus, Majorianus, and Anthemius. The rest of them are a collection of poems addressed to his friends upon particular subjects. His letters contain a variety of particulars relating to polite literature and profane history.

APOLLINARIUS (Claudius), a learned bishop of Hierapolis, who, about the year 170, presented to Marcus Aurelius an excellent Apology for the Christians.

APOLLINARIUS the YOUNGER, thus called to distinguish him from his father, called *Apollinaris the Elder*, was at first lecturer or reader of Logic, and afterwards bishop of that city. He was universally esteemed the greatest man of his age, both for learning and piety, and a most accurate and nervous defender of the faith against all its enemies: but notwithstanding this, on his advancing some opinions that were not approved, he was anathematized as an heretic by the second general council of Constantinople in 381.

APOLLODORUS, born at Damascus, a famous architect under Trajan and Hadrian; he had the direction of the bridge of stone which Trajan ordered to be built over the Danube in the year 104, which was esteemed the most magnificent of all the works of that emperor. Hadrian, one day as Trajan was discoursing with this architect upon the buildings he had raised at Rome, would needs give his judgment, and shewed he understood nothing of the matter. Apollodorus turned upon him bluntly, and said to him, "Go paint citruls, for you are very ignorant of the subject we are talking upon." Hadrian at this time boasted of his painting citruls well. This insult cost Apollodorus his life.

APOLLODORUS, a celebrated painter of Athens, about 408 years before the birth of Christ, was the first who invented the art of mingling the colours, and of expressing the lights and shadows. He was admired also for his judicious choice of subjects, and for the beauty and strength of colouring surpassed all the masters that went before him. He excelled likewise in statuary.

APOLLODORUS the Athenian, a famous grammarian, the son of Aclepiades, and disciple of Aristarchus. He wrote many works not now extant; but his most famous production was his *Bibliotheca*, concerning the origin of the gods: this work consisted of twenty-four books, but only three are now in being. Several other pieces of his are to be found in Fabricius's *Bibliotheca Græca*. There were various other persons of this name: Scipio Testi, a Neapolitan, has written a treatise of the Apollodoruses, which was printed at Rome in 1555; and Dr. Thomas Gale published a work of the same kind in 1675.

APOLLONIA, seats sacred to Apollo, instituted upon the following occasion. Apollo, having vanquished Python, went with his sister Diana to Ægiale; but, being driven from thence, he removed to the island of Crete. The Ægialeans were soon after visited with a plague; upon which, consulting the soothsayers, they were ordered to send seven young men, and as many virgins, to appease those deities and bring them back into their country. Apollo and Diana being thus appeased, returned to Ægiale: in memory of which, they dedicated a temple to Pitho, the goddess of persuasion; whence a custom arose of choosing every year seven young men, and as many virgins, to go as it were in search of Apollo and Diana.

APOLLONIUS RHODIUS, the author of the *Argonautics*, was born at Alexandria in Egypt: he taught rhetoric at

Rhodes, and hence was called *Rhodius*. He flourished about the 137th Olympiad, and was keeper of the Alexandrian library. Longinus, in his treatise *Of the Sublime*, commends this poet. The ancient Scholia upon his *Argonautics*, still extant, are extremely useful, and full of learning.

APOLLONIUS of Perga, a city of Pamphylia, was a great geometrician, under the reign of Ptolemy Euergetes, which reaches from the 2d year of the 133d Olympiad to the 3d year of the 139th. He studied a long time at Alexandria, under the disciples of Euclid; and composed several works, of which that only of the Conics remains.

APOLLONIUS, a Pythagorean philosopher, born at Tyana in Cappadocia, about the beginning of the first century. At sixteen years of age he became a strict observer of Pythagoras's rules, renouncing wine, women, and all sorts of flesh; not wearing shoes, letting his hair grow, and wearing nothing but linen. He soon after set up for a reformer of mankind, and chose his habitation in a temple of *Æsculapius*, where he is said to have performed many wonderful cures. Philostratus has wrote the Life of Apollonius, in which there are numberless fabulous stories recounted of him. We are told that he went five years without speaking; and yet, during this time, that he stopped many seditions in Cilicia and Pamphylia: that he travelled, and set up for a legislator; and that he gave out he understood all languages, without having ever learned them; that he could tell the thoughts of men, and understood the oracles which birds gave by their singing. The heathens were fond of opposing the pretended miracles of this man to those of our Saviour: and by a treatise which Eusebius wrote against one Hierocles, we find that the drift of the latter, in the treatise which Eusebius refutes, seems to have been to draw a parallel betwixt Jesus Christ and Apollonius, in which he gives the preference to this philosopher. Mr. Du Pin has wrote a confutation of Philostratus's Life of Apollonius. Apollonius wrote some works, *viz.* four books of judicial astrology; a treatise upon the sacrifices, shewing what was proper to be offered to each deity; and a great number of letters, all of which are now lost.

APONO (Peter d'), a famous philosopher and physician of his age, was born in 1250, in a village near Padua. He studied some time at Paris, and was there promoted to the degree of doctor in philosophy and physic. When he came to practise as a physician, he is said to have insisted on very large sums for his visits: we are not told what his demands were in the place of his residence, but it is affirmed that he would not attend the sick in any other place under an hundred and fifty florins a-day; and when he was sent for by Pope Honorius IV. he demanded four hundred ducats for each day's attendance. He was suspected of magic, and prosecuted by the inquisition on that account, but he died before the process against him was finished, being then in the eightieth year of his age. The most remarkable book which Apono wrote, was that which procured him the surname of Conciliator; he wrote also a piece entitled "De medicina omnimoda."

APOSTACY (*Encycl.*). The perversion of a Christian to Judaism, Paganism, or other false religion, was punished by the emperors Constantius and Julian with confiscation of goods; to which the emperors Theodosius and Valentinian added capital punishment, in case the apostate endeavoured to pervert others to the same iniquity. A punishment too severe for any temporal laws to inflict: and yet the zeal of our ancestors imported it into this country; for we find by Bracton, that in his time apostates were to be burnt to death. Doubtless the preservation of Christianity, as a national religion, is, abstracted from its own intrinsic truth, of the utmost consequence to the civil state: which a single instance sufficiently demonstrate. The belief of a future state of

rewards and punishments, the entertaining just ideas of the moral attributes of the supreme Being, and a firm persuasion that he superintends and will finally compensate every action in human life (all which are clearly revealed in the doctrines, and forcibly inculcated by the precepts, of our saviour Christ), these are the grand foundation of all judicial oaths; which call God to witness the truth of those facts, which perhaps may be only known to him and the party attesting: all moral evidence therefore, all confidence in human veracity, must be weakened by apostacy, and overthrown by total infidelity. Wherefore all assents to Christianity, or endeavours to depreciate its efficacy, in those who have once professed it, are highly deserving of censure. But yet the loss of life is a heavier penalty than the offence, taken in a civil light, deserves; and, taken in a spiritual light, our laws have no jurisdiction over it. This punishment, therefore, has long ago become obsolete; and the offence of apostacy was for a long time the object only of the ecclesiastical courts, which corrected the offender *pro salute anime*. But about the close of the last century, the civil liberties to which we were then restored being used as a cloak of maliciousness, and the most horrid doctrines subversive of all religion being publicly avowed both in discourse and writings, it was thought necessary again for the civil power to interpose, by not admitting those miscreants to the privileges of society, who maintained such principles as destroyed all moral obligation. To this end it was enacted by statute 9 and 10 W. III. c. 32. That if any person educated in, or having made profession of, the Christian religion, shall by writing, printing, teaching, or advised speaking, deny the Christian religion to be true, or the holy Scriptures to be of divine authority, he shall upon the first offence be rendered incapable to hold any office or place of trust; and, for the second, be rendered incapable of bringing any action, or of being guardian, executor, legatee, or purchaser of lands, and shall suffer three years' imprisonment without bail. To give room however for repentance, if, within four months after the first conviction, the delinquent will in open court publicly renounce his error, he is discharged for that once from all disabilities.

APOTOME (*Encycl.*). This term is employed by Euclid to denote the difference between two lines or quantities which are only commensurable in power. Such is the difference between 1 and $\sqrt{2}$, or the difference between the side of a square and its diagonal. The doctrine of apotomes in lines, as delivered by this ancient mathematician in the tenth book of his Elements, is a very curious subject, and has always been admired by such as understood it. The first algebraical writers in Europe, such as Lucas de Burgo, Cardan, Tartalea, Stifelius, &c. employed a considerable portion of their works on an algebraical exposition of that which led them to the doctrine of surd quantities.

APPALACHIKOLA, a river of North America, formed by the junction of the rivers Chatahouchee and Flint, which have their source in the Appalachian Mountains, and running nearly parallel in a southerly direction, flow united into the gulf of Mexico, opposite St. George's Island.

APPENZEL, a town of Switzerland, capital of the canton of the same name, which is divided into twelve communities; fix called the interior, are Roman-catholics; the fix exterior, are Protestants. It is forty miles E. of Zurich. Long. 9. 31. E. Lat. 47. 21. N.

APPIAN, an eminent writer of the Roman history in Greek, under the reigns of Trajan and Hadrian. He was of a good family in Alexandria in Egypt; whence he went to Rome, and there distinguished himself so well as an advocate, that he was chosen one of the procurators of the empire, and the government of a province was committed to him. He

did not complete the Roman history in a continued series; but wrote distinct histories of all nations that had been conquered by the Romans, in which he placed every thing relating to those nations in the proper order of time. His style is plain and simple: in the opinion of Pothius, he has shewn the greatest knowledge of military affairs, and the happiest talent at describing them, of any of the historians; for while we read him, we in a manner see the battles which he describes. Of all this voluminous work there remains only what treats of the Punic, Syrian, Parthian, Mithridatic, and Spanish wars, with those against Hannibal, the civil wars, and the wars in Illyricum, and some fragments of the Celtic or Gallic wars.

APPIUS CLAUDIUS, a Sabine by birth, one of the principal inhabitants of Regillum: his shining merit having drawn the envy of his fellow-citizens upon him, he retired to Rome with all his family. Appius was admitted into the senate, and was made consul, with Publius Servilius Priscus, in 238 from the building of Rome: but he was hated by the plebeians, being an austere opposer of their clamours and seditions. The Claudian family continued long one of the most illustrious of the patrician families in Rome; and several in succession of the name of Appius supported the same stern character that distinguished their first founder.

APRIES, son of Piammis king of Egypt; the fame with Pharaoh Hophrah in Jeremiah and Ezekiel. He ruined Sidon, and some say he put Jeremiah to death. He thought neither God nor man could dethrone him; which yet was easily done by Amasis, and he himself was strangled by the Egyptians.

APRIL-FOOL, a ludicrous trick played on the unsuspecting, on the first day of April. The origin of this childish and not very innocent frolic, has been variously accounted for; but probably it had its rise merely in the fickleness of the weather usual at this period of the year; since those whom fun-shine may have enticed abroad are liable to return wet to the skin by the rain.

APROSIO (Angelico), born at Ventimiglia, in the republic of Genoa, 1607, was a man of great reputation among the learned, and wrote several books. At fifteen years of age he entered into the order of the Augustines, where he became so much esteemed, that he was appointed vicar-general of the congregation of our Lady of Consolation at Genoa. As soon as he had finished his studies, he taught philosophy, which he continued to do for five years; after which he travelled into several parts of Italy, and settled at Venice in the year 1639, in the convent of St. Stephen. What rendered him most famous, was the library of the Augustins at Ventimiglia, which being chiefly collected by him, was a proof of his love for books, and his excellent taste. He published a book concerning this library, which is much sought after by the curious. He used to disguise himself under fictitious names in the title-pages of his books; which conduct might, perhaps, be owing to the subjects he wrote upon; they not being always suited to a religious life: such, for instance, as the Adonis of the cavalier Marino, &c. And if we consult the authors who have given us a catalogue of the writers of Liguria, we find that he assumed sometimes the name of Mafoto Galistoni, sometimes that of Carlo Galistoni, Scipio Glareano, Saprio Saprio, Odauro Scioppio, &c. His life is written in the book entitled *La Bibliotheca Aprosiana*. Several authors have bestowed upon him very great encomiums, some of whom have been perhaps rather too extravagant in their praises.

APT, an ancient town of France, in the department of the Mouths of the Rhone and late province of Provence. Its commerce consists in prunes, coarse ferges, and wax chandlery, for which last there is a great demand. There are many fine Roman antiquities, and it is seated on the river Calaron,

twenty miles N. of Aix, and twenty-five S. E. of Orange Long. 5. 30. E. Lat. 43. 51. N.

APTA, or **APTA JULIA** (Pliny); now *Api*, in Provence, on the river Calaron, seven leagues to the north of Aix, and nine to the north of Avignon. In the Notitie it is called *Civitas Aptensum*: Pliny reckons it among the Latin towns. That it was a colony, appears from an inscription on a stone found at Arles (Simond). E. Long. 5. 56. Lat. 43. 23.

APTERA (Strabo, Stephanus); **APTERON** (Pliny); **APTERIA** (Ptolemy): an inland town of Crete, whose port was Cifamus, on the west side of the island (Strabo); twelve miles to the south of Cydonia, towards the Montes Leuci, and as many from the Sinus Amphimales. So called from the Sirens, who, being there vanquished in song by the Muses, stript themselves of their wings, and out of grief leaped into the sea (Stephanus). There was a town of Lycia of the same name. E. Long. 25. Lat. 35. 50.

APULEIUS (Lucius), a Platonic philosopher, universally known by his performance of the Golden Ass. He lived in the second century, under the Antonines; and was born at Madaura, a Roman colony in Africa. He studied first at Carthage, then at Athens, and afterwards at Rome, where he learned the Latin tongue without the help of a master. He was a man of a curious and inquisitive disposition, especially in religious matters: this prompted him to take several journeys, and to enter into several societies of religion. He spent his whole fortune almost in travelling; so that, at his return to Rome, when he was about to dedicate himself to the service of Osiris, he had not money enough to defray the expence attending the ceremonies of the reception, and was obliged to pawn his clothes to raise the necessary sum. He supported himself afterwards by pleading causes; and as he was a great master of eloquence, and of a subtle genius, many considerable causes were trusted to him. But he availed himself more by a good marriage than by his pleadings: a widow, named *Pudentilla*, who was neither young nor handsome, but wanted a husband, and was very rich, took a great fancy to him. This marriage drew upon him a troublesome law-suit. The lady's relations, pretending he made use of force to gain her heart and money, accused him of being a magician before Claudius Maximus, proconsul of Africa. Apuleius was under no great difficulty of making his defence. As *Pudentilla* was determined, from considerations of health, to enter upon a second marriage, even before he had seen this pretended magician, the youth, deportment, pleasing conversation, vivacity, and other agreeable qualities, of Apuleius, were charms sufficient to engage her heart. He had the most favourable opportunities too of gaining her friendship, for he lodged some time at her house: *Pudentilla's* eldest son having a great friendship for him, was likewise desirous of the match, and solicited him in favour of *Pudentilla*. "Do you make a wonder (said Apuleius, in his defence) that a woman should marry again, after having lived a widow 13 years? it is much more wonderful that she did not marry again sooner. You think that magic must have been employed to prevail with a widow of her age, to marry a young man; on the contrary, this very circumstance shews how little occasion there was for magic." He offered to prove by his marriage-contract, that he got nothing of *Pudentilla* but a promise of a very moderate sum, in case he survived her and had children by her. He was also obliged to make such confessions in court as *Pudentilla* would gladly have excused. He said she was neither handsome nor young, nor such as could anyways tempt him to have recourse to enchantments: moreover, he added, that Pontianus her son proposed the marrying his mother to him only as a burden, and the action of a friend and philosopher. He also took notice of many inconveniences which attend the

marrying of widows, and spoke highly of the advantages of a maid above a widow: "A handsome virgin (said he), let her be ever so poor, is abundantly portioned; she brings to her husband a heart quite new, together with the flower and first-fruits of her beauty. It is with great reason that all husbands set to great a value upon the flower of virginity: all the other goods which a woman brings her husband are of such a nature, that he may return them again, if he has a mind to be under no obligation to her; that alone cannot be restored, it remains in the possession of the first husband. If you marry a widow, and she leaves you, she carries away all that she brought you." Upon which passage Mr. Bayle makes a very coarse remark, viz. "That this good which is never taken back out of the hands of a husband, is very chimerical; and that there is never a baker nor a butcher, who would lend sumpce upon this imperishable possession." The apology is still extant, and is reckoned a very fine piece. Apuleius was extremely indefatigable in his studies; and composed several books, some in verse, and others in prose; but most of them have been lost. He took great pleasure in declaiming, and was heard generally with great applause: when he declaimed at Occa, the audience cried out with one voice, that they ought to confer upon him the honour of citizen. The citizens of Carthage heard him with great satisfaction, and erected a statue to him; and several other cities did him the same honour. Several critics have published notes on Apuleius's Golden Ass, and there have been translations of it into different languages.

APULIA, now **PUGLIA**, a territory of Italy, bordering on the Adriatic, and extending from the river Rento to Tarentum in length, and from the Adriatic to the Lucani in breadth. *Apuli* the people (Horace), divided into the *Apulia Daunia*, now called *Puglia Pinna*, or the *Capitanata*; and into the *Apulia Peuceia*, now *Terra di Bari* (Pliny, Ptolemy). Apulia abounded in sheep, which yielded the finest wool (Martial). It is now the east side of the kingdom of Naples.

APURIMA, or **APORIMIA**, a rapid river of South America, in Peru, thirty miles from the river Abanazai.

AQUA-NEGRA, a town of Italy, in the Mantuan; on the river Chiera, twelve miles W. of Mantua. Long. 10. 25. E. Lat. 45. 12. N.

AQUA REGIA (*Encycl.*). In this article, line tenth, for "except silver," read "except gold."

AQUÆ AUGUSTÆ (Ptolemy); **AQUÆ TARBELLICÆ** (Antioine); **AQUENSIS CIVITAS**, in the Notitia. Now *Aqes*, or *Dax*, a town in Galsony, on the river Adour, famous for its baths. W. long. 1. 40. Lat. 43. 56.

AQUÆ CUTILLÆ, a lake of the Sabines, in the territory of Reate (Pliny); **LACUS CUTILLIENSIS** (Varro); with a moveable island in it (Seneca, Pliny); supposed to be the centre of Italy (Varro). The waters were medicinal, and extremely cold, good for a weak stomach and in weak nerves (Pliny). Vespasian used them every summer; and there he died (Sueton, Xiphilin of Dio). Now *Lago di Castiglione*.

AQUÆ FLAVIÆ, a town on the confines of Galicia and Portugal, so called from Vespasian and Titus. The inhabitants are called *Aquiflavienſes* (Coins). Now called *Chaves*, a mean hamlet; but the ruins of its bridge testify its former grandeur. W. long. 6. 6. Lat. 41. 40.

AQUÆ TAVRI, hot waters or baths in Tuscany, at the distance of three miles from the sea, said to be discovered by a bull; whence the appellation. There are still to be seen the ruins of these baths. The people are called *Aquensēs Taurini* (Pliny). Now *Aquapendente*, in Orvieto. E. long. 12. 40. Lat. 42. 40.

AQUARIANS (*Encycl.*). Epiphanius calls these aquarians mentioned in our original article *Encratites*, from their abstinence; St. Austin, *Aquarians*, from their use of water;

and Theodoret, who says they sprang from Tatian, *Hydroporustæ*, because they offered water instead of wine. But besides these there was another sort of Aquarians, who did not reject the use of wine as unlawful; for they administered the eucharist in wine at evening service; but, in their morning assemblies, they used water, for fear the smell of wine should discover them to the heathens.

AQUILEIA, a large city of the Carni, or Veneti, and a noble Roman colony, which was held thither between the first and second Macedonian wars (Livy). It is washed by two rivers, the *Natiso* and *Turrus* (Pliny). The reason of leading this colony was, in order to be a bulwark against the neighbouring barbarians. The colony was afterwards increased with 1500 families by a decree of the senate (Livy); from which it became a very famous port-town (Herodian). The emperor Julian ascribes the appellation to the augury of an eagle at the time of building it; but Isaac Vossius on Mela, to the great plenty of water, as if the town were called *Aquilegia*. The harbour, at the mouth of the *Natiso*, is distant sixty stadia from the city; so that ships of burden are towed up the river (Strabo). It is still called *Aquileia*, but greatly fallen from its former splendor. E. long. 15. 32. Lat. 45. 45.

AQUILINE, something belonging to or resembling an eagle; thus, an aquiline nose is one bent somewhat like an eagle's beak.

AQUINUS (St. Thomas), styled the *Angelical Doctor*, was of the ancient and noble family of the counts of Aquino, descended from the kings of Sicily and Aragon; and was born in the castle of Aquino, in the Terra di Lavoro in Italy, in the year 1224 or 1225. He entered into the order of the Dominicans; and, after having taught school-divinity in most of the universities of Italy, at last settled at Naples, where he spent the rest of his life in study, in reading of lectures, and in acts of piety; and was so far from the views of ambition or profit, that he refused the archbishopric of that city, when it was offered him by Pope Clement IV. He died in 1274, leaving an amazing number of writings, which were printed at Venice in 17 volumes, folio, in the year 1490. He was canonized by Pope John XXII. in the year 1323; and Pius V. who was of the same order with him, gave him, in 1567, the title of the Fifth Doctor of the church, and appointed his festival to be kept with the same solemnity as those of the other four doctors. His authority has always been of great importance in the schools of the Roman Catholics. Lord Herbert in his Life of Henry VIII. tells us, that one of the principal reasons which induced that king to write against Luther, was, that the latter had spoken contemptuously of Aquinas.

AQUINO (Philip d'), in Latin *Aquanus* or *Aquinus*, having turned from Judaism, had a pension from the clergy of France; and acquired much reputation by his knowledge of the Hebrew language, which he taught at Paris, in the reign of Lewis XIII. and by the books he published, among which is his *Dictionarium Hebræo-Chaldeo-Thaludico-Rabbinicum*. His grandson, Anthony D'Aquinus, was first physician to Lewis XIV.

ARACAN (*Encycl.*). It is capital of a small kingdom, to the north-east of the bay of Bengal, situated in E. long. 93. 0. N. Lat. 20. 30. It has the convenience of a spacious river, and a harbour large enough to hold all the ships in Europe. It is said by Schouten to be as large as Amsterdam; but the houses are slight, being made with palm-trees and bamboos, and covered with leaves of trees. They are seldom above six feet high, but have many windows or air-holes. But the people of the highest rank are much better accommodated. They have no kitchens, chimneys, or cellars, which obliges the women to dress the victuals out of doors. Some of the streets are on the ridges of rocks, wherein are a great many thops.

Their orchards and gardens contain all the fruit common to the Indies, and their trees are green all the year. Their common drink is toddy; which is the sap of the cocoa-tree, and when new will intoxicate like wine, but soon grows foul. Elephants and buffaloes are very numerous here, and are made use of instead of horses. They have plenty of provisions, and but little trade: for when Mr. Channoch was here in 1686, with six large ships, there was nothing to be had in the way of commerce; and yet the country produces lead, tin, flick-lac, and elephants' teeth. The Mogul's subjects come here to purchase these commodities; and sometimes meet with diamonds, rubies, and other precious stones. They were formerly governed by a king of their own, called the king of the *White Elephant*; but this country has been conquered by the king of Pegu. They pay little or no regard to the chastity of their women, and the common sailors take great liberties among them. Their religion is Paganism; and their idols, temples, and priests, are very numerous. The dress of the better sort is very light, for it consists chiefly of a piece of white cotton over their arms, breast, and belly, with an apron before. The complexion of the women is tolerable; they wear thin flowered gauze over their breast and shoulders, and a piece of cotton, which they roll three or four times round their waist, and let it hang as low as their feet. They curl their hair, and put glass rings in their ears, and stretch them of a monstrous length. On their arms and legs they have hoops of copper, ivory, silver, &c. The country produces great quantities of rice, and the water is good. Their flocks of sheep and herds of cattle are also numerous near Aracan; but what they say of the towns and villages, with which the country is pretended to be overpread, may be doubted. Captain Hamilton affirms, that there are but few places inhabited, on account of the great number of wild elephants and buffaloes, which would destroy the fruits of the ground; and that the tigers would destroy the tame animals. There are some islands near the sea, inhabited by a few miserable fishermen, who can just keep themselves from starving, though they are out of the reach of oppression. The rich burn the dead bodies; but the poor, who are not able to buy wood, throw them into the river.

ARÆ PHILENOR, or PHILENORUM (Strabo); to the south of the Syrtis Major; but in Peutinger, more westerly, to the south almost of the Syrtis Minor. In Strabo's time, the altars were not extant, but a village of the same name stood on the spot. On a dispute about limits, between the Cyrenæans and Carthaginians, it was agreed that two of each people should let out on the same day, and that where they should happen to meet, there the limits of both should be fixed. The Phileni, two brothers, Carthaginians, undertook it for Carthage; these, after having advanced a great many miles into the territory of the Cyrenæans, were met by their antagonists; who enraged at their being before-hand with them so far, gave them the option of either returning back, or of being buried alive on the spot: like zealous patriots, they chose the latter; and there the Carthaginians raised two altars in honour of the Phileni. (Sallust, Valerius Maximus.)

ARAL (*Encycl.*). Of this great lake, the length from north to south is said to be near 120 miles, and its breadth from east to west about seventy. The shore on the west side is high and rocky, and destitute of good water: yet there are abundance of wild horses, asses, antelopes, and wolves; as also a fierce creature called a *jolbart*, which the Tartars say is of such a prodigious strength as to carry off a horse. It is surprising that this lake should be quite unknown to geographers till within these few years. Several great rivers, which were supposed to run into the Caspian sea, are now known to fall into this lake, particularly the Sihun or Sirr, and the Gihun

or Arno, so often mentioned by the Oriental historians. This lake, like the Caspian sea, has no visible outlet. Its water is also very salt; and for that reason is conveyed by the neighbouring inhabitants by small narrow canals into sandy pits, where the heat of the sun, by exhaling the water, leaves them a sufficient quantity of salt. The same kinds of fish are found in Aral that are found in the Caspian sea. The former is also called the *Lake of Eagles*.

ARAM (Eugene), a man of considerable erudition, remarkable for his unhappy fate, and the singular circumstances that occasioned and attended it, was born at Ramsgill, a little village, in Netherdale, Yorkshire, in the year 1704. He was removed, when very young, together with his mother, to Skelton, near Newby: and when he was five or six years old, his father making a little purchase in Bondgate near Rippon, his family went thither. He was there sent to school, where he learned to read the New Testament in English, which was all he was ever taught, except that, some considerable time after, he was under the tuition of the Reverend Mr. Alcock of Burnal, for about a month. When he was about thirteen or fourteen years of age, he went to his father at Newby, and attended him in the family there, till the death of Sir Edward Blackett. It was in the house of this gentleman, to whom his father was gardener, that his propensity to literature first appeared. He was, indeed, always of a solitary disposition, and uncommonly fond of retirement and books; and here he enjoyed all the advantages of leisure and privacy. He applied himself at first chiefly to mathematical studies, in which he made a considerable proficiency. At about sixteen years of age, he was sent to London to the house of Mr. Christopher Blackett, whom he served for some time in the capacity of book-keeper. After continuing here a year or more, he was taken with the small-pox, and suffered severely under that distemper. He afterwards returned into Yorkshire, in consequence of an invitation from his father, and there continued to prosecute his studies, but found in polite literature much greater charms than in the mathematics; which occasioned him now chiefly to apply himself to poetry, history, and antiquities. After this he was invited to Netherdale, where he engaged in a school and married. But his marriage proved an unhappy connection; for to the misconduct of his wife he afterwards attributed the misfortunes that befel him. In the mean while, having perceived his deficiency in the learned languages, he applied himself to the grammatical study of the Latin and Greek tongues; after which he read, with great avidity and diligence, all the Latin classics, historians, and poets. He then went through the Greek Testament; and, lastly, ventured upon Hesiod, Homer, Theocritus, Herodotus, and Thucydides, together with all the Greek tragedians. In 1734, William Norton, esq., a gentleman who had a friendship for him, invited him to Knarsborough. Here he acquired the knowledge of the Hebrew, and read the Pentateuch in that language. In 1744 he returned to London, and served the Reverend Mr. Painblanc, as usher in Latin and writing, in Piccadilly; and, with this gentleman's assistance, he acquired the knowledge of the French language. He was afterwards employed, as an usher and tutor, in several different parts of England; during which time he became acquainted with heraldry and botany. He also ventured upon Chaldee and Arabic, the former of which he found easy from its near connection with the Hebrew. He then investigated the Celtic, as far as possible, in all its dialects; and having begun to form collections, and made comparisons between the Celtic, the English, the Latin, the Greek, and the Hebrew, and found a great affinity between them, he resolved to proceed through all these languages, and to form a comparative lexicon. But in the midst of these learned labours and inquiries, it appears,

that Aram committed a crime, which could not naturally have been expected from a man of so studious a turn, and which is the more extraordinary, as the inducement that led him to it is said to have been only gain, though he himself afterwards assigned a different motive. On the 8th of February, 1744-5, he murdered Daniel Clark, a shoemaker, in conjunction with whom, and another person, he seems before to have been concerned in some fraudulent practices. The murder, however, was concealed near fourteen years, and then was discovered by a skeleton being accidentally found, which was supposed to be that of Clark. This was a mistake; but it led to a discovery of the whole transaction; and Aram's wife, from whom he had separated a considerable time, was a principal evidence against him. When he was apprehended, on suspicion of this murder, he was usher of a school at Lynn in Norfolk. He was brought from thence to York-castle, and on the 3d of August, 1759, was tried at the county-assizes for the murder. He was found guilty on the testimony of Richard Houseman, corroborated by that of his own wife, and other circumstantial evidence. After his conviction, he confessed the justice of his sentence, but made an attempt upon his own life, by cutting his arm in two places with a razor, which he had concealed for that purpose. By proper applications, he was brought to himself, and, though weak, was conducted to the place of execution; where, being asked if he had any thing to say, he replied in the negative. He was immediately after executed, and his body being conveyed to Knaresborough forest, he was there hung in chains, pursuant to his sentence.

ARANDE-DE-DOUERO, a town of Old Castile in Spain, on the Douero, 42 miles E. of Valladolid. Long. 3. 30. W. Lat. 41. 40. N.

ARAR (Cæsar, Strabo); *Araris* (Dio Cassius); *Saucona* (Ammian); a river of Celtic Gaul, now the *Saône*; which rises out of mount Vogesus on the confines of Lorraine, runs through the Franche Comte and Burgundy, and below Lyons falls into the Rhone. It is so incredibly flow, that the eye cannot distinguish which way it moves (Cæsar); and therefore Ptolemy calls it the *Shuggih River*. Its course is from north to south. It is famous for a bridge of Cæsar, which was built by the soldiers in one day. It is navigable equally with the Rhone.

ARATUS, general of the Achæans, conquered Niocles tyrant of Sicyon. Two years after, he surprised the castle called *Acrocorinthus*, and drove out the king of Macedonia: he delivered Argos from its tyrants, and was poisoned by Philip II. king of Macedonia, whom he had newly restored: he was about 62 when he died, the second year of the 121st Olympiad. He was interred at Sicyon, and received the greatest honours from his countrymen. His son, who had also been prætor, was poisoned by King Philip. Polybius gives us so great a character of Aratus, the father's, Commentaries on History, that the loss of so valuable a work is highly to be regretted.

ARATUS, a Greek poet, born at Soli, or Solæ, a town in Cilicia, which afterwards changed its name, and was called *Pompeopolis*, in honour of Pompey the Great. He flourished about the 124th, or, according to some, the 126th Olympiad, in the reign of Ptolemy Philadelphus king of Egypt. He discovered in his youth a remarkable poignancy of wit, and capacity for improvement; and having received his education under Dionysius Heracleotes, a Stoic philosopher, he espoused the principles of that sect. Aratus was physician to Antigonus Gonatus, the son of Demetrius Poliorcetes, king of Macedonia: this prince, being a great encourager of learned men, sent for him to court, admitted him to his intimacy, and encouraged him in his studies. The *Phænomena* of Aratus, which is still extant, gives him a title to the character of an astronomer, as well as a poet; in this piece he describes the

nature and motion of the stars, and shews the particular influences of the heavenly bodies, with their various dispositions and relations. He wrote this poem in Greek verse: it was translated into Latin by Cicero; who tells us, in his first book *De oratore*, that the verses of Aratus are very noble. This piece was translated by others as well as Cicero; there being a translation by Germanicus Cæsar, and another into elegant verse by Festus Avienus. An edition of the *Phænomena* was published by Grotius, at Leyden, in 4to. 1600, in Greek and Latin, with the fragments of Cicero's version, and the translations of Germanicus and Avienus, all which the editor has illustrated with curious notes. He was certainly much esteemed by the ancients, since we find so great a number of scholiasts and commentators upon him. There are several other works also ascribed to Aratus. Suidas mentions the following: Hymns to Pan; Astrology and Astrothely; a composition of Antidotes; an *Emphylion* on Theopropus; an *Hæroica* on Antigonus; an Epigram on Phila, the daughter of Antipater, and wife of Antigonus; an Epicudium of Cleombrotus; a Correction of the Odysey; and some Epistles, in prose. Virgil, in his *Georgics*, has imitated or translated many passages from this author; and St. Paul has quoted a passage of Aratus. It is in his speech to the Athenians (Acts xvii. 28.) wherein he tells them, that some of their own poets have said, *Τὸ πᾶν καὶ γὰρ ἐξ αὐτοῦ*: "For we are all his offspring." These words are the beginning of the fifth line of the *Phænomena* of Aratus.

ARAUSIO, or *Civitas Arausensis*, or *Arauscorum* (Notitiæ); *Colonia Secundanorum* (Mela, Pliny, Coins), so called because the veterans of the second legion were there settled: the capital of the Cavares, in Gallia Narbonensis; now Orange, in the west of Provence, on an arm of the rivulet Egue, which soon after falls into the Rhone, from which it is distant a league to the east, at the foot of a mountain. Here is an ancient amphitheatre to be still seen. E. long. 4. 46. Lat. 44. 10.

ARBACES, governed Média under Sardanapalus. Seeing him spinning among a company of his women, he stirred up his people to revolt, and dethroned Sardanapalus; who thereupon burnt himself in his palace. Arbaces being crowned, began the monarchy of the Medes, which lasted 317 years under nine kings, till Astyages was expelled by Cyrus. Arbaces reigned 22 years, and died A. M. 3206.

ARBE, an episcopal town of the republic of Venice, in an island of the same name, on the coast of Dalmatia, from which it is but five miles distant.

ARBURY, a village of Cambridgehire, where are the remains of a camp, and where many coins have been found. It is one mile N. of Cambridge.

ARBUTHNOT (Alexander), principal of the university of Aberdeen in the reign of James VI. of Scotland, was born in the year 1538. He studied first at Aberdeen; and was afterwards sent over to France, where, under the famous Cujacius, he applied himself to the study of the civil law. In the year 1563 he returned to Scotland, and took orders. Whether he was ordained by a bishop, or by prebys, is a matter of uncertainty. In 1568 he was appointed minister of Arbuthnot and Logy-Buchan; and in the following year, Mr. Alexander Anderson being deprived, our author was made principal of the King's College at Aberdeen, in his room. In the general assembly which met at Edinburgh in the years 1573 and 1577, he was chosen moderator; and to the end of his life was an active supporter of the reformed religion. He died in 1583, in the 45th year of his age; and was buried in the college church of Aberdeen. We are told in the Biographia, that he was eminent as a poet, a philosopher, a mathematician, a lawyer, a divine, and a physician. He wrote, *Orationes de origine*

et dignitate juris, printed Edinb. 1572, 4to. His contemporary, Thomas Maitland, wrote a copy of Latin verses on the publication of this book : they are printed in the *Delic. Poetar. Scot.* He published Buchanan's History of Scotland in the year 1582.

ARCADIA (*Encycl.*). This district lies to the north Achaia, to the east Argos and Laconia, Mellœnia to the south, and Elis to the west. According to Pliny, the wine of this country cured barrenness in women, and inspired the men with rage; and the berries of the yew gathered there were so strong a poison, that whoever slept or took refreshment under that tree were sure to die. In Strabo's time there were few cities remaining in it, most of them being destroyed in the Grecian wars. Eustathius says, that the country was anciently called *Pelagîa*, from Pelagos, who brought the people, from roots, herbs, and leaves of trees, to feed on acorns, especially beech-mast; as Artemidorus observes, that the Arcadians usually lived on acorns. It was also called *Lycœonia*, *Gigantes*, and *Parrhesia* (Stephanus). The Arcadians are greatly commended for their love of, and skill in, music (Virgil, Polybius). To imitate the Arcadians, is to labour and toil for the benefit of others, never conquering their own, but the enemies of others (Hesychius). This probably took its rise from the ancient Arcadians being accustomed to hire themselves out as mercenaries to foreign nations. Homer commends their martial prowess, their pastures, their sheep, and their country well-watered. The gentilitious name is *Arcades*; who boasted of their great antiquity, and that they were older than the sun and moon (Apollonius Rhodius, Nonnius, Plutarch, Ovid, Statius). They were the first who had a year of three months, and therefore called *Proclentis*, because their year was prior to that adjusted in Greece to the course of the moon (Censorinus).

ARCESILAUS, a celebrated Greek philosopher, about 300 years before the Christian æra, was born at Pitane in Eolis. He founded the second academy, which is called the *second school*. He was a man of great erudition, and well versed in the writings of the ancients. He was remarkable for the severity of his criticisms; but nevertheless he knew how to accommodate himself to the age, and pursue the allurements of pleasure. He had a great number of disciples. His doctrines were different in several respects from those of the ancient school : and perhaps he was led into this diversity of opinions by many capital errors in the ancient school, such as the incredible arrogance of the dogmatists, who pretended to assign causes for all things; the mysterious air they had thrown upon the doctrine of ideas; the entirely discarding the testimony of the senses; the objections of the Pyrrhonists, who now began to broach their opinions; the powerful opposition of the Stoics and Peripatetics, who discovered the feeble parts of the academic philosophy. These might have given cause to reform the ancient school, and to found a new one. The middle school, therefore, laid it down as a principle, that we could know nothing; nor even assure ourselves of the certainty of this position; from whence they inferred, that we should affirm nothing, but always suspend our judgment. They advanced, that a philosopher was able to dispute upon every subject, and bring conviction with him, even upon contrary sides of the same question; for there are always reasons of equal force both in the affirmative and negative of every argument. According to this doctrine, neither our senses, nor even our reason, are to have any credit; and therefore, in common affairs, we are to conform ourselves to received opinions. Arcesilaus was succeeded by his disciple Lacydes.

ARCEUIL, a village of France, three miles south of Paris, remarkable for an aqueduct, which is thought to equal the works of the ancient Romans. It was built in 1624, by Mary

de Medicis: its water is distributed into the different parts of Paris.

ARCHELAUS, a celebrated Greek philosopher, the disciple of Anaxagoras, flourished about 440 years before Christ. He read lectures at Athens, and did not depart much from the opinions of his master. He taught that there was a double principle of all things, namely, the *expansion and condensation* of the air, which he regarded as infinite. Heat, according to him, was in continual motion. Cold was ever at rest. The earth, which was placed in the midst of the universe, had no motion. It originally resembled a wet marsh, but was afterwards dried up; and its figure, he said, resembled that of an egg. Animals were produced from the heat of the earth, and even men were formed in the same manner. All animals have a soul, which was born with them; but the capacities of which vary according to the structure of the organs of the body in which it resides.—Socrates, the most illustrious of his disciples, was his successor.

ARCHELAUS, the son of Herod the Great, was declared king of Judea the second year after the birth of Christ. He put to death 3000 persons before he went to Rome to be confirmed by Augustus. However, that emperor gave him half of what had been possessed by his father; but at length, on fresh complaints exhibited against him by the Jews, he banished him to Vienne in Gaul, A.D. 6, where he died.

ARCHELAUS, the son of Apollonius, one of the greatest sculptors of antiquity, was a native of Ionia, and is thought to have lived in the time of the Emperor Claudius. He executed, in marble, the apotheosis of Homer. This masterpiece in sculpture was found in 1568, in a place named *Pratochia*, belonging to the princes of Colonna, where, it is said, the Emperor Claudius had a pleasure-house. Father Kircher, Cupert, Spanheim, and several other learned antiquaries, have given a description and explication of this work.

ARCHILOCHUS, a famous Greek poet and musician, was, according to Herodotus, contemporary with Candaules and Gyges, kings of Lydia, who flourished about the 14th Olympiad, 724 years before Christ. But he is placed much later by modern chronologists; viz. by Blair 686, and by Priefley 660 years, B. C.

He was born at Paros, one of the Cyclades. His father Telecles was of so high a rank, that he was chosen by his countrymen to consult the oracle at Delphos concerning the sending a colony to Thafos : a proof that he was one of the most distinguished families upon the island. However, he is said to have sullied his birth by an ignoble marriage with a slave called *Enipo*, of which alliance our poet-musician was the fruit.

Though Archilochus shewed an early genius and attachment to poetry and music, these arts did not prevent his going into the army, like other young men of his birth; but in the first engagement at which he was present, the young poet, like Horace, and like our own Suckling, lost his buckler, though he saved his life by the help of his heels. *It is much easier, said he, to get a new buckler, than a new existence.* This pleasantry, however, did not save his reputation; nor could his poetry or prayers prevail upon Lycambes, the father of his mistress, to let him marry his daughter, though she had been long promised to him. After these mortifications, his life seems to have been one continued tissue of disgrace and repentment.

Archilochum prescribo rabies amavit iambos.

Hor. Art. Poet. 79.

Archilochus, with fierce resentment warn'd,
Was with his own severe jambics arm'd.

FRANCIS.

The rage of Archilochus was proverbial in antiquity; which

compared the provoking this satyrist to the treading upon a serpent; a comparison not very severe, if it be true that Lycambes, and, as some say, his three daughters, were so mortified by his satire, as to be driven to the consolation of a halter.

In this piece many adventurers are mentioned, full of de-famation, and out of the knowledge of the public. There were likewise many loose passages in it; and it is said to have been on account of this satire that the Lacedæmonians laid a prohibition on his verses.

However, according to Plutarch, there is no bard of antiquity by whom the two arts of poetry and music have been so much advanced, as by Archilochus. To him is attributed particularly the sudden transition from one rhythm to another of a different kind, and the manner of accompanying those irregular measures upon the lyre. Heroic poetry, in hexameter verse, seems to have been solely in use among the more ancient poets and musicians; and the transition from one rhythm to another, which lyric poetry required, was unknown to them: so that, if Archilochus was the first author of this mixture, he might with propriety be styled the *Inventor of Lyric Poetry*, which, after his time, became a species of versification wholly distinct from heroic.—To him is likewise ascribed the invention of *Epodes*. See *EPODES*.

Our poet-musician is generally ranked among the first victors of the Pythic games; and we learn from Pindar, that his muse was not always a termagant; for though no mortal escaped her rage, yet she was at times sufficiently tranquil and pious to dictate hymns in praise of the gods and heroes. One in particular, written in honour of Hercules, acquired him the acclamations of all Greece; for he sung it in full assembly at the Olympic games, and had the satisfaction of receiving from the judges the crown of victory consecrated to real merit. This hymn, or ode, was afterwards sung in honour of every victor at Olympia, who had no poet to celebrate his particular exploits.

Archilochus was at last slain by one Callonax Corax, of the island of Naxos; who, though he did it in fight, according to the laws of war, was driven out of the temple of Delphi, by command of the oracle, for having deprived of life a man consecrated to the Muses.

The names of Homer and Archilochus were equally revered and celebrated in Greece, as the two most excellent poets which the nation had ever produced. This appears from an epigram in the Anthologia; and from Cicero, who ranks him with poets of the first class, and in his Epistles tells us, that the grammarian Aristophanes, the most rigid and scrupulous critic of his time, used to say, that the longest poem of Archilochus always appeared to him the most excellent.

ARCHIMAGUS, the high-priest of the Persian Magi, or worshippers of fire. He resided in the highest fire-temple; which was had in the same veneration with them, as the temple of Mecca among the Mahometans. Zoroastres first settled it at Balch; but after the Mahometans had over-run Persia in the 7th century, the Archimagus was forced to remove from thence into Kerman, a province of Persia, lying on the southern ocean, where it hath continued to this day. Darius Hyastres took upon himself the dignity of Archimagus; for Porphyry tells us, he ordered before his death, that among the other titles, it should be engraven on his monument, that he had been *Master of the Magi*; which plainly implies that he had borne this office among them; for none but the Archimagus was master of the whole sect. From hence it seems to have proceeded, that the kings of

Persia were ever after looked on to be of the sacerdotal tribe, and were always initiated into the sacred order of the Magi, before they took on them the crown, and were inaugurated into the kingdom.

ARCHIMEDES. (*Encycl.*) Of the death of this celebrated geometrician, others have related the circumstances somewhat differently. Cicero, when he was quaestor in Italy, discovered his tomb, on which was carved a cylinder and sphere. Some of the works of this great mathematician are lost, but others are preserved. His pieces which remain are, 1. Two books of the Sphere and Cylinder. 2. The Dimensions of a Circle. 3. Of Centres of Gravity, or Equiponderants. 4. Of Spheroids and Conoids. 5. Of spiral Lines. 6. The Quadrature of a Parabola. 7. Of the Number of the Sand. 8. Of Bodies that float on Fluids. The best edition of these is that published at London, in 1675, 4to. Among the works of Archimedes which are lost, we may reckon the descriptions of the following inventions, which we may gather from himself and other ancient authors. 1. Περὶ τῆς εὐφρανίας, or his account of the method which he used to discover the mixture of gold and silver in the crown. 2. His description of the *Καρχήλιος*, or *Καρχήλιος*, an engine to draw water out of places where it is stagnated. Athenæus, speaking of the prodigious ship built by the order of Hiero, tells us, that Archimedes invented the cochlion, by means of which the hold, notwithstanding its depth, could be drained by one man. (Διωνυσίου, lib. v.) Diodorus Siculus informs us (lib. v.) that he contrived this machine to drain Egypt, and that by a wonderful mechanism it would empty the water from any depth. 3. The *Εκχ.* by means of which (according to Athenæus, Διωνύσιος, lib. v.) he launched Hiero's great ship. 4. The *Τραπέζιον*, of the power of which Tzetzes gives a hyperbolic relation, Chil. ii. hist. 35. 5. The machines he used in the defence of Syracuse against Marcellus. Of these we have an account in Polybius, Livy, and Plutarch. 6. His burning-glasses, with which he is said to have set fire to the Roman galleys. Galen, Περὶ κρασμάτων, lib. iii. 7. His pneumatic and hydraulic engines, concerning which he wrote books, according to Tzetzes, Chil. ii. hist. 35.

ARCHITECTURE (*Encycl.*). Correct the following errors in page 293: last line of the second column, for pl. 25 read pl. 26. In the title to Part III. omit the words "including aquatic works." The reference also in Sect. XVI. p. 293, is erroneous: for pl. 25 read pl. 26.

Under this article, vol. i. p. 277, we have spoken of that species of architecture generally termed *Gothic*, which we shall extend with the following extracts from a memoir published in the fourth volume of the Transactions of the Royal Society of Edinburgh, by Sir James Hall, bart. whose professed object is, to enquire how structures of such beauty, taste, and magnificence, could be the work of a people "whom we are accustomed to call ignorant and barbarous."

"Although the connection between beauty and utility (says the author) be still involved in such obscurity, that we are unable to decide concerning the universality of that connection; of one thing we are certain, that, in a work intended to answer some useful purpose, whatever visibly counteracts that purpose always occasions deformity. Hence it is, that, even where ornament is principally intended, the ostensibly useful object of the work, if it have any such, must be provided for, in the first place, in preference to every other consideration.

"But in most useful works, some parts occur, the shape of which is quite indifferent with respect to the proposed

utility, and which, therefore, the artist is at liberty to execute as he pleases: a liberty which has opened a wide field to the taste and invention of ingenious men of every age and country, who have turned their attention to the composition of ornaments; and whose exertions have been more or less influenced by the state of civilization in which they lived. It would seem, however, if we may judge by those various efforts, that little has been effected by mere human ingenuity; since we see that recourse has been had, almost universally, to nature, the great and legitimate source of beauty; and that ornament has been attained by the imitation of objects, to which she has given a determinate and characteristic form.

"Where the materials employed are themselves possessed of variety and elegance, the attainment of this object requires little or no alteration of their natural forms. Thus cups are made of shells, of cocoa nuts, or of ostrich eggs; the character and beauty of which depend upon the natural form of the materials: and in the case of the bottles used by the Roman-catholic pilgrims, an example occurs of an utensil, in which the natural form has undergone little or no variation, since it consists of the hard outward skin of a gourd, of the same shape in which it grew upon the plant. This last class of forms has been introduced, by imitation, into works composed of shapeless materials. Thus we have silver cups in the form of those made of shells, and fruit-dishes of stone-ware in the form of baskets.

"As stone is not naturally possessed of any peculiar shape, and as the useful object proposed, by structures formed of it, may be accomplished in various ways, very great latitude is left to the invention of the artist. We see, accordingly, that in every country where much refinement has been introduced, great pains have been bestowed in ornamenting stone buildings with figures representing various natural objects; whilst the building itself has been executed in imitation of a structure, composed of materials which naturally possess a determinate and characteristic form. Such was the method followed by the architects of ancient Greece, who constructed temples, and other public edifices, in imitation of a rustic fabric, composed of square beams, supported upon round posts or stems of trees, and who derived the numerous ornaments of that beautiful style from circumstances which would naturally take place in such a structure.

"A faint and distant resemblance, however, of the original, has generally been found to answer all the end proposed by the imitation; a resemblance, which may sometimes be traced in the general distribution of the edifice, sometimes in its minute parts, and not unfrequently in both.

"But the forms of nature thus introduced have been greatly modified by those of masonry. For though stone is by nature shapeless, yet, in the course of practice, many peculiar forms have been long established, and currently employed, in working it; such as straight lines, plane surfaces, square angles, and various mouldings used to soften the effect of abrupt terminations: all of which, originating in motives of mechanical convenience, and of simple ornament, had, in very early times, been appropriated to masonry, and considered as essential in every finished work of stone; so that, when the imitation of nature was introduced, these masonic forms still maintained their ground, and, being blended with the forms of nature, the two classes reciprocally modified each other.

"This combination of art with nature, of which we see the most perfect example in the Corinthian capital, produces

what are called architectonic forms, in which the variety of nature, being subjected to the regularity of art, the work acquires that peculiar character which, in a natural object, we consider as offensive, under the name of *formality*; but which, in architecture, we admire as a beauty, under the name of *symmetry*: thus, we reprobate the formality of an avenue, and praise the symmetry of a colonnade.

"Such is the nature of architectonic imitation; a device which probably originated in accident, but to which architecture is indebted for its highest attainments."

The stone edifices of ancient Greece having been constructed in imitation of wooden fabrics, composed of square beams laid at right angles on round posts or stems of trees, Sir James Hall conceives that the Gothic structures with pointed arches have been executed in imitation of a rustic dwelling, constructed in the following manner: "Suppose a set of round posts driven firmly into the ground in two opposite rows, the interval between the neighbouring posts in the same row being equal to that between the rows, and each post being raised above the ground to a height equal to three of those intervals: then a set of long and flexible rods of willow being applied to each post, let them be thrust into the ground at its base, and bound to it by two tyings, one near the ground, and another at two-thirds of its height: the rods being let loose from this last point upwards, and free to be moved in any direction. Let three rods be connected with each outside corner post, and five with each of the others, and let their position be such as to cover the inside of the post, so that when seen from between the rows the lower part of each post shall be concealed from the view, and appear to the eye like a bundle of rods (see Pl. 14.).

"Thus the skeleton of a thatched roof may be formed by means of the loose ends of the rods. A rod from one of the posts being so bent as to meet a similar one from the post immediately opposite to it, in the middle of the space between them, let the two rods be made to cross each other, and let them be bound together at their crossing (fig. 2.), and we shall have the exact form of the Gothic arch. The frame being done with each pair of opposite posts, and a set of pointed arches being formed, let them be connected together by means of a straight pole laid upon the forks of the crossing rods, and bound to each of them, as in fig. 3: then let a loose rod be brought from each of any two contiguous posts in the same row, so as to form a pointed arch, similar to that just described, and nearly of the same height. This being done with every two contiguous posts (fig. 4.), and a new set of pointed arches being thus produced, standing opposite to each other in pairs, let each pair be bound by a horizontal pole lying on the opposite forks, and crossing the longitudinal pole already spoken of.

"Two of the rods of each corner post, and three of those of each of the others, being thus disposed of, we have one of each corner post and two of each middle post still to employ, which is done as follows: A pair of these unoccupied rods being brought from any two posts which stand diagonally to each other, and made to meet in the middle, not as in the first case crossing in an angle, but side by side, forming a semicircle, and joined together after the manner of a hoop; and the same being done with every pair of diagonal posts (fig. 5.), the whole rods will have been employed.

"In this manner a frame would be constructed fit to support thatch or other covering; and such a one has probably been often used. It would seem, however, that, for the sake of strength, the number of rods has been increased in each cluster, by the introduction, between every two of them, of an additional rod, which rising with them to the

GOTHIC ARCHITECTURE.

Fig. 6.

Fig. 5.

roof, still continues its middle position, as they spread afunder, and meets the horizontal pole at an intermediate point." This is shewn in fig. 6, which is drawn with its covering of thatch; and, from the imitation of a dwelling so constructed, we may easily trace the three leading characteristics of Gothic architecture, the pointed arch, the clustered column, and the branching roof, as exhibited in fig. 7.

Our author, upon similar principles, accounts for the peculiar forms of the Gothic door and window, the pointed spire, &c. but it seems he has not contented himself with speculative theories, but has actually submitted his hypothesis to the test of experiment. In short, Sir James Hall has constructed a building in this style, which has far surpassed even his own expectation, and has also gained the approbation of every man of taste and science by whom it has been seen. "A set of posts of ash, about three inches in diameter, were placed in two rows, four feet asunder, and at the interval of four feet in the rows; then a number of slender and tapering willow rods, ten feet in length, were applied to the posts, and, in the manner which we have described, formed into a frame, which being covered with thatch, produced a very substantial roof, under which a person can walk with ease.

"This little structure exhibits, in miniature, all the characteristic features of the Gothic style. It is in the form of a cross, with a nave, a choir, and a north and south transept. The thatch, being so disposed on the frame as not to hide the rods of which it is composed, they represent accurately the pointed and semicircular arches, and all the other peculiarities of a groined roof."

As the architects of the present age are miserably deficient in this beautiful species of building, the public are greatly indebted to Sir James Hall for his spirited endeavours to preserve and restore it in this country.

ARCHONS (*Encycl.*). The tribunal of the archons was composed of nine officers. The first was properly the *archon*; by whose name the year of his administration was distinguished. The title of the second was *king*; that of the third *poenæobus*: to these were added six *thesmothetæ*. These magistrates, elected by the scrutiny of beans, were obliged to prove, before their respective tribes, that they had sprung, both in their father's and their mother's side, for three descents, from citizens of Athens. They were likewise to prove that they were attached to the worship of Apollo, the tutelary god of their country; that they had in their house an altar consecrated to Apollo; and that they had been respectfully obedient to their parents; an important and sacred part of their character, which promised that they would be faithful servants to their country. They were likewise to prove, that they had served in a military capacity the number of years which the republic required of every citizen: and this qualification gave the state experienced officers; for they were not allowed to quit the army till they were forty years of age. Their fortune too, of which they were to inform those before whom they were examined, was a warrant for their fidelity.

After the commissioners, who were appointed to enquire into their character and other requisites, had made a report of them, they were then to swear that they would maintain the laws; which obligation if they neglected, they engaged to send to Delphi a statue of the weight of their bodies. According to a law of Solon, if an archon got drunk, he was condemned to pay a heavy fine, and sometimes even punished with death. Such magistrates as the Athenian archons were well entitled to respect. Hence it was eternal infamy to insult them; and hence Demosthenes observed, that

VOL. X.

to treat the thesmothetæ with disrespect, was to shew disrespect to the republic.

Another qualification indispensably required of the second officer of this tribunal, who was called the *king*, was, that he had married the daughter of an Athenian citizen, and that he had espoused her a virgin. This was exacted of him, says Demosthenes, because part of his duty was to sacrifice to the gods, jointly with his wife, who, instead of appealing, would have irritated them, if she had not possessed both those honours.

The enquiry into the private title of the nine archons was very severe; and this attention was the more necessary, as they had a right to take a seat in the Areopagus, after they had quitted their office, and given an account of their administration.

When any obscurity occurred in the laws, relative to religion and the worship of the gods, the interpretation was submitted to the tribunal of the archons.

Aristotle observes, that Solon, whose aim was to make his people happy, and who found their government in his time aristocratical, by the election of the nine archons, who were annual magistrates, tempered their power, by establishing the privilege of appealing from them to the people, called by lot to give their suffrage, after having taken the oath of the Heliastæ, in a place near the Panathænaum, where Hippias had formerly calmed a sedition of the people, and bound them to peace by an oath.

ARCHYTAS of Tarentum, a philosopher of the Pythagorean sect, and famous for being the master of Plato, Eudoxas, and Philolaus, lived about 408 years before Christ. He was an excellent mathematician, particularly in that part of the science which regards mechanics: he is said to have made a wooden pigeon that could fly, and to be the first that brought down mathematics to common uses. He is said to be the inventor of the ten categories. He asserted, that God was the beginning, the supporter, and the end, of all things. There are two epistles preserved in Diogenes Laertius, one from Archytas to Plato, and another from Plato to Archytas. He acquired great reputation in his legislative capacity. He likewise commanded the army seven times, and was never defeated; but was at last cast away in the Adriatic Sea, and thrown upon the coast of Apulia.

ARCOT, a city of Hindoostan, and capital of the Carnatic, situated on the river Palari. In a dispute among some of the native princes of India, Colonel Clive, with a small party of English, took possession of Arcot, in the year 1751, for Mahomed Ali Khan, son of Anawardi Khan, the nabob of Arcot, who had been killed in battle. The French attempted in vain to wrest it from him, but were compelled to raise the siege. In the year 1760, in a quarrel with the nabob, it was taken by Colonel Coote, after defeating the French at Wandewash; and the garrison surrendered prisoners of war after the batteries had been opened against it from the second to the sixth of February: fifty-five miles W.S.W. Madras, and sixty-five N.N.W. Pondicherry. Long. 79. 30. E. Greenwich. Lat. 12. 50. N.

ARDEA, a town of Latium, the royal residence of Turnus, king of the Rutuli (Livy); so called, either from the augury of the heron (Hyginus); or from the excessive heat of the country (Martial). It was a marshy sickly situation (Strabo, Seneca). It was built by Danaë, the mother of Perseus (Virgil); about five miles distant from the sea, and 20 from Rome: now a hamlet. It was a Roman colony (Livy). The inhabitants are called *Ardeates*. E. Long. 17. 49. Lat. 41. 30.

ARDECHE, a river of France, which gives name to one

of the departments, and rises three leagues from Langogne, and runs into the Rhone, about a league above Pont St. Esprit.

ARDENNE, a forest in France, formerly of vast extent; but the trees are in many places grubbed up, and where they flood are built cities, towns, and abbeys. At present it extends from Thionville, near the country of Liege, to Donchery and Sedan, on the confines of Champagne. The roads are so narrow in some places, that two waggoners cannot pass each other; and therefore the waggoners are obliged to provide themselves with bells or horns to give one another notice to stop in time.

ARDENNES, a forest of Germany and France, formerly of a great extent, comprehending, according to some, all the country between the Meuse and the Rhine, and according to others all between the Rhine and the Scheldt; what now remains is situated principally on the Meuse, from Montmedy to the bishopric of Liege. One of the departments of France takes its name from this forest; the principal towns are Mezieres, Sedan, Grandpre, Vouziers, Rethel, Rocroy, Donchery, and Givet.

ARDS, barony of, in the county of Down in Ireland: it is a narrow slip of land, in some places three, and in none above six miles broad; but the soil is for the most part tolerably good. It lies between the lake of Strangford and the sea, and in the fourth part it is opposite to Lecale. Sir Thomas Smith obtained a patent for this barony from Queen Elizabeth, and sent his natural son with a colony to possess it; but he was intercepted and slain by an Irishman. After Sir Thomas's death, Ards was granted by James I. to some of the Scots nobility.

ARDUBA, an ancient city of the Pannonians. It was taken by Germanicus about the 7th year of the Christian era; but its reduction was more owing to the disagreement that reigned among the inhabitants, than to the valour of the Romans. The greater part of the citizens were for submitting; but the women, more fond of their ancient laws and liberties than the men, joined some Roman deserters, and, falling upon their husbands, killed a great number of them: but being at last overcome by the men, who then submitted to the Romans, the women either threw themselves headlong from the tops of the walls, or setting fire to their houses, burnt themselves and their children to death.

AREKEA, a sea-port town on the coast of Africa, in the Red Sea: fifty-five miles from Suaken.

ARELATE, or **ARELATUM**, is a town of Gallia Narbonensis, situated on the Rhone, denoting a town on, or beyond, a marsh, according to the particular situation of the speaker; called *Arelate Sextanorum* (Pliny, Mela, Cato), because it had a colony of the sixth legion. Writers of the lower age call it *Arelas*, *atis* (Prudentius, Ausonius). There was a double Arelas, one on each side of the river and joined by a bridge (Ausonius); that on the left side is thought to have been built by Constantine. Tiberius's father was sent by Julius Caesar at the head of the colony (Suetonius); and hence the appellation *Julia Paterna*, as appears from an inscription. It was the favourite place of the Romans, and greatly ornamented; and hence called *Gallula Roma* (Ausonius). It is now called *Aries*. E. Long. 5. 5. Lat. 43. 40.

ARENSHARD, a tract in Denmark, in the duchy of Sleswick, containing the greatest part of the famous rampart, built by the Danish king Goric, in the beginning of the 9th century, as a defence against the irruptions of the Saxons and Slavi. It extends across the country, about nine miles in length.

ARENSWALDE, a town of Germany, in the circle of

Upper Saxony, and New Mark of Brandenburg: ninety-four miles N.E. Berlin, fifty N.N.E. Kustrin. Long. 33. 14. E. Ferro. Lat. 53. 10. N.

AREOPAGUS (*Encycl.*). The edifice of the Areopagus was extremely simple; and its roof, which was at first of the most common materials, remained in that state till the time of Augustus. This we learn from Vitruvius. Orestes was the first who thought of embellishing it. He raised in it an altar to Minerva. Helikewise adorned it with two feats of solid silver; on one of which the *accuser* sat, and the *accused* on the other. The one feat was consecrated to *Injury*, and the other to *Impudence*. This religious sketch was brought to perfection by Epimenides, who erected altars to those allegorical deities and soon after a temple, which Cicero mentions in his second book of laws. This temple corresponded with that which Orestes had built to the *Furies*, who brought him to Athens, and procured him the protection of Minerva. Epimenides dedicated it a second time to the *Furies*, or *severe Goddesses*, as they were termed by the Athenians. A man was thought lost without resource, and a victim to every human ill, if he enforced a perjury by invoking the sacred name of those tremendous divinities.

Those who employed their thoughts in solving the mysteries of Paganism, imagined that the Eumenides had their temple so near the court Areopagus, that they might enlighten the judges by their inspiration, and, by their continual assistance, prevent them from committing those errors to which human weakness is liable. To propitiate those terrible deities; and to procure their favour for the Areopagus, they were worshipped with great punctuality and devotion; and the senate itself appointed their priests. Demosthenes had been nominated to preside over their sacrifices; and he thought it very extraordinary, that he, to whom the republic had confided so important an office, should be publicly impeached.

It was natural to associate with the Eumenides the other deities who shared with them the sovereign empire over the dead. Epimenides placed in their temples the statues of Pluto, of Mercury, and of Tellus. They were all, according to Pausanias, of an agreeable form. Each of them was placed upon an altar, on which the citizens, or strangers, who had been acquitted by the Areopagus, made their grateful offerings.

But it was not to gratitude alone that these several deities owed all their incense that smoked upon their altars. They who had been accused before the senate, harassed with superstition, and uncertain how these deities would be affected towards them, were lavish of sacrifices to obtain their clemency, by which they hoped their judges would likewise be influenced.

The tomb of Oedipus was another of the ornaments of the Areopagus. It was in the outward court of the Areopagus, where a barge was likewise placed, which made a part of the pomp at the public games.

Whatever homage and implicit obedience the court of Areopagus might derive from all this religious parade, the public good was always dearer to them than any lower advantages they might have drawn from the altars and temples with which they were surrounded.

The senate assembled in a hall built on the summit of a hill, which was ascended with difficulty by the old men bent with age. However, as for some time they only assembled on the three last days of each month, they bore with patience this inconvenient situation. But public affairs multiplied to such a degree, that they were obliged to add to the three former sittings, a fourth, which was held on the

seventh day of the month, and which was soon succeeded by an assembly every day. Their meetings were so regular, that they were not interrupted by the most solemn festivals, till Cephisodorus was archon, who, in the third year of the 105th Olympiad, made a decree, which obliged the Areopagites to celebrate, after the example of the other courts, the Apaturian feasts, which lasted five days.

This assiduous and painful exercise of their office made the Areopagites feel all the inconvenience of the situation of their tribunal, and determined them to remove it to a part of the city, called the *Royal Portico*. It was a square, exposed to all the inclemencies of the weather. When the judges, who assembled there in profound silence, had taken their places, they were inclosed by a thread, or rather a cord, drawn around them.

They held their assemblies in the night, that their attention to public affairs might not be diverted by external objects;—and (adds Lucian) that they might only be influenced by the arguments, and not by the presence and action, of the speakers. This circumstance explains a passage in Athenæus, who tells us, that none knew the numbers nor faces of the Areopagites. The custom of administering justice in the open air was not peculiar to them. It was followed by all the other tribunals, when they tried for murder; for two reasons:—1st, That the judges, the sworn protectors of innocence, might not be hurt by being under cover with criminals, whose hands were polluted with blood. 2dly, That the accuser and the accused might not be under the same roof.

When all the members of the senate were convened, a herald enjoined silence, and ordered the people to retire. As soon as they had departed, the assembly proceeded to business; and as they deemed the least preference a flagrant injustice, the causes which they were to determine were drawn by a kind of lottery; and the same chance which brought them up, distributed them to different numbers of judges, small or great, according to the importance of the several causes.

In early times, the parties themselves stated their cause in a simple manner. The eloquence of advocates was thought a dangerous talent, fit only to varnish crimes. But afterwards the Areopagus, on this point, relaxed from their severity;—at first the accused, and soon after the accusers, were permitted to engage those to make the attack and the defence, whose profession it was to exert the art of speaking, for others, with accuracy and elegance.

Sextus Empiricus seems not to have sufficiently distinguished times, where he says, that the court of Areopagus did not suffer those who were to be tried at their bar to avail themselves of the abilities of others. What undoubtedly led him into that mistake, was, an inviolable custom of that tribunal, which prohibited, in pleadings, all that warm and picturesque oratory which seduces the judgment and inflames the passions. When the suffrages were collected, each person gave his in silence. They voted with a small flint, which they held betwixt the thumb and the two next fingers, and which they put into one of the two urns that stood in a corner of the hall. One stood before the other. The first was called the *urn of death*; the second, the *urn of compassion*. That of death was of brass, and was termed *proper*; that of compassion was of wood, and was termed *improper*. The judges commonly brought their flint to the assembly, and put it into the urn; but, that all the suffrages might be collected, the herald took the two urns, and presented them, one after another, to every senator, commanding him, in the name of the republic, no longer to defer his acquittal, or condemnation. For this method of giving sentence, which was called *ἀποδοὺν ψήφους*, because it kept

the vote of each person undiscovered, the Thirty Tyrants, to make themselves masters of the decisions of the Areopagus, substituted another, by means of which they knew exactly the opinion of each of the judges: for they obliged them to bring their flints publicly, and lay them upon two tables placed before them, the situation of which was quite opposite to that of the urns; for the first of those tables was that of *life*, and the second that of *death*.

The first substances with which they gave their suffrages were not small pieces of the bones of a hog, as some authors assert, but sea-shells, for which pieces of brass of the same form, termed *spindyla*, were afterwards substituted. The substances with which they voted were distinguished by their form and colour. Those which condemned were black, and perforated in the middle; the others were white, and not perforated. The precaution of piercing the black ones tends to prove, what we have already observed, that the court of Areopagus sat in the night: for what end did it serve to pierce the black shells or flints, if the judges could have seen them and the white ones, and consequently have distinguished their colours by the assistance of the light? But as they passed sentence in the dark, it is evident that a difference besides that of colour was necessary, to know the black ones from the white. The judges were likewise permitted to multiply at pleasure the distinction between signs, which essentially distinguished the fates of men.

After the suffrages were collected, they were taken out of the two urns, and put into a third vase of brass. They were then counted; and as the number of white or black flints was higher or inferior, one of the judges drew with his nail a shorter or a longer line, on a tablet, with a waxen surface, on which the result of each cause was marked. The short line expressed acquittal; the long condemnation.

With regard to the emoluments of the judges they were as moderate as those of the advocates. The length of the process did not enhance its expence; and when the decision of a cause was postponed till the next day, the committee were only paid an obolus on that day. Hence Mercury, in Lucian, is surprised that such sensible old men as the senators of Areopagus were, should sell at so low a price the trouble of ascending to high.

As to the number of the judges which composed the Areopagus, some authors, attentive only to a part of Solon's regulations, by which he enacted, that for the future none but the nine archons should be admitted members of the Areopagus, have imagined that this tribunal was filled anew every year, and that it never consisted of more than nine magistrates. This opinion, and some others, are refuted by the circumstantial account which Diogenes Laertius gives us of the condemnation of Socrates. This great man had wished to substitute a rational hypothesis for the fabulous and extravagant system of religion which prevailed in his time. His project, however laudable, appeared impious in the eye of superstition. Information was laid against him before the Areopagus, and he had as many accusers as fellow-citizens. After the charges and the answers were heard, they proceeded to suffrages; the opinions were divided, but not equally, for the number of those who condemned him exceeded by 281 the number of those who declared him innocent. He made an ironical reply to this iniquitous sentence, by telling his judges, that he took it for granted, they would admit him to a maintenance in the Prytanæum. On this sarcasm, 80 of those who had voted in his favour forsook him, went over to the opposite party, and condemned him to die. Here then we have 361 judges who condemn; to whom if we add those who persist in acquitting him, the number must be very considerable.

Of all the judgments of the Areopagus, the most famous one, excepting that of Mars, was the sentence which they passed on Orestes. His trial, which happened under Demophon the 12th king of Athens, in 375 of the Attic æra, owed all its lame to a remarkable circumstance, that gave rise to a custom which was observed ever afterwards. Orestes had killed his mother; he was accused before the Areopagus, and cited to appear in that court. He would have lost his life in consequence of the equal division of the votes, had not Minerva, moved with his misfortunes, declared herself for those who had absolved him, and joined her suffrage to theirs. Thus Orestes was saved. In veneration to this miracle, the Areopagites, whenever the suffrages were equally divided, decided in favour of the accused, by granting him what they termed the *shell of Minerva*. Cephalus and Dædalus were condemned by the Areopagus long before the time of Orestes.

We find in ancient authors some decisions of this tribunal, which bear the strongest marks of justice, though their objects are not interesting. We shall here quote an anecdote from Aulus Gellius, and Valerius Maximus, of a woman who was accused of having poisoned her husband and her son. She was taken, and brought before Dolabella, who was then procenful of Asia. She was no sooner in his presence, than she owned the fact; and added, that she had very good reasons for putting her husband and her son to death.—“I had (said she), to my first husband, a son whom I tenderly loved, and whose virtues rendered him worthy of my affection. My second husband, and the son whom I bare to him, murdered my favourite child. I thought it would have been unjust to have suffered those two monsters of barbarity to live. If you think, sir, that I have committed a crime, it is your province to punish it; I certainly shall never repent of it.” This affair embarrassed Dolabella. She was afterwards sent to the Areopagus; and that court, when they had examined her a long time, ordered her and her accuser to appear before them again a hundred years after, from the first day of her trial.

We must not, however, suppose that the Areopagus always preserved its own reputation; for such is the constitution of human affairs, that perfection, with regard to them, is a violent, consequently a transitory, state. Pericles, who lived about a hundred years after Solon, to flatter the people and win them to his party, used his utmost efforts to weaken the authority of the Areopagus, which was then disliked by the multitude. He took from it the cognizance of many affairs which had before come under its jurisdiction; and, to forward his design of humbling it, employed the eloquence of Ephialtes, whose talents were formidable, and who was an avowed enemy to the great men of Athens.

The Areopagus itself seemed to second the endeavours of a man who projected its ruin, and by its misconduct hastened its fall. The old rules of the court, by which none were admitted its members but those whose unexceptionable conduct would support its majesty, seemed too severe. They grew less delicate in their choice; and presuming that the faults with which they dispensed, would soon be reformed in the society of so many good examples, vice imperceptibly crept among them: corruption, at first secret and timid, grew insensibly open and daring, and made such progress, that the most shameful crimes were soon exhibited on the stage; and they were not copied from the low and abandoned multitude but from those senators, once the venerable and austere censors of idleness and of vice. Demetrius, the comic poet, wrote a piece, which he entitled *The Areopagite*,

where he strips the mask off those hypocritical legislators, who were never equally apt to be seduced by wealth and by beauty. So much had the Athenian senate degenerated in the days of Isocrates, cir. 340 years before the Christian æra.

Before this tribunal St. Paul was called to give an account of his doctrine, and converted Dionysius one of their number.

The end of this court of judicature is as obscure as its origin, which was derived from very remote antiquity. It existed, with the other magistracies, in the time of Pausanias, i. e. in the 2d century. The term of its subsequent duration is not ascertained; but a writer, who lived under the emperors Theodosius the elder and younger, in the 5th century, mentions it as extinct.

ARETIN (Guido), famous for his musical improvements, lived in the 11th century. He was a native of Arezzo, a city in Tuscany; and having been taught the practice of music in his youth, and probably retained as a chorister in the service of the Benedictine monastery founded in that city, he became a monk professed, and a brother of the order of St. Benedict.

In this retirement he seems to have devoted himself to the study of music, particularly the system of the ancients, and, above all, to reform their method of notation. The difficulties that attended the instruction of youth in the church-offices were so great, that, as he himself says, ten years were generally consumed barely in acquiring the knowledge of the plain-song; and this consideration induced him to labour after some amendment, some method that might facilitate instruction, and enable those employed in the choral office to perform the duties of it in a correct and decent manner. If we may credit those legendary accounts that are extant in old monkish manuscripts, we should believe he was assisted in his pious intention by immediate communications from heaven; some speak of the invention of the syllables as the effect of inspiration; and Guido himself seems to have been of the same opinion, by his saying it was revealed to him by the Lord; or, as some interpret his words, in a dream: but graver historians say, that being at vespers in the chapel of his monastery, it happened that one of the offices appointed for that day was the hymn to St. John.

*UT queant laxis
Mira gestorum
Solus polluit*

*REsonare fibris
Famuli tuorum
LAbis reatum.*

Sancite Joannes.

During the performance of the hymn, he remarked the iteration of the words, and the frequent returns of *UT, RE, MI, FA, SOL, LA*: he observed likewise a dissimilarity between the closeness of the syllable *MI*, and the broad open sound of *FA*, which he thought could not fail to impress upon the mind a lasting idea of their congruity; and immediately conceived a thought of applying the six syllables to perfect an improvement either then actually made by him, or under consideration, viz. that of converting the ancient tetrachords into hexachords.

Struck with the discovery, he retired to his study; and having perfected his system, began to introduce it into practice: the persons to whom he communicated it were the brethren of his own monastery, from whom it met with but a cold reception, which, in the epistle to his friend, he ascribes and outwardly to its true cause, envy; however, his interest with the abbot, and his employment in the chapel, gave him an opportunity of trying the efficacy of his method on the boys who were training up

for the choral service, and it exceeded the most sanguine expectation. "To the admiration of all (says Cardinal Baronius), a boy thereby learnt, in a few months, what no man, though of great ingenuity, could before that attain in several years."

The fame of Guido's invention soon spread abroad, and his method of instruction was adopted by the clergy of other countries: we are told by Kircher, that Hermanus bishop of Hamburg, and Elviricus bishop of Osnaburg, made use of it; and by the authors of the *Histoire Littéraire de la France*, that it was received in that country, and taught in all the monasteries in the kingdom. It is certain that the reputation of his great skill in music had excited in the pope a desire to see and converse with him; of which, and of his going to Rome for that purpose, and the reception he met with from the pontiff, he himself has given a circumstantial account in the epistle hereafter mentioned.

The particulars of this relation are very curious; and as we have his own authority, there is no room to doubt the truth of it. It seems that John XX. or, as some writers compute, the 19th pope of that name, having heard of the fame of Guido's school, and conceiving a desire to see him, sent three messengers to invite him to Rome; upon their arrival, it was resolved by the brethren of the monastery that he should go thither attended by Grimaldo the abbot, and Peter the chief of the canons of the church of Arezzo. Arriving at Rome, he was presented to the holy father, and by him received with great kindness. The pope had several conversations with him, in all which he interrogated him as to his knowledge in music; and upon sight of an antiphony which Guido had brought with him, marked with the syllables agreeable to his new invention, the pope looked on it as a kind of prodigy; and ruminating on the doctrines delivered by Guido, would not stir from his seat till he had learned perfectly to sing off a verse: upon which he declared, that he could not have believed the efficacy of the method, if he had not been convinced by the experiment he had himself made of it. The pope would have detained him at Rome; but labouring under a bodily disorder, and fearing an injury to his health from the air of the place, and the heats of the summer, which was then approaching, Guido left that city upon a promise to revisit it, and explain to his holiness the principles of his new system. On his return homewards, he made a visit to the Abbot of Pomposa, a town in the duchy of Ferrara, who was very earnest to have Guido settle in the monastery of that place; to which invitation it seems he yielded, being, as he says, desirous of rendering so great a monastery still more famous by his studies there.

Here it was that he composed a tract on music, entitled *Micrologus*, i. e. "a short discourse;" which he dedicated to Theobald bishop of Arezzo; and finished, as he himself at the end of it tells us, under the pontificate of John XX. and in the 34th year of his age. Vossius speaks also of another musical treatise written by him, and dedicated to the same person.

Most of the authors who have taken occasion to mention Guido, speak of the *Micrologus* as containing the sum of his doctrine: but it is in a small tract, entitled *Argumentum novi Cantus inveniendi*, that his declaration of his use of the syllables, with their several mutations, and in short his whole doctrine of solmisation, is to be found. This tract makes part of an epistle to a very dear and intimate friend of Guido, whom he addresses thus, "Beatissimo atque dulcissimo fratri Michaeli;" at whose request the tract itself seems to have been composed.

Whether Guido was the author of any other tracts, is not easy to determine. It no where appears that any of his works were ever printed, except that Baronius, in his *Annales Ecclesiastici*, tom. XI. p. 73, has given at length the epistle from

him to his friend Michael of Pomposa, and that to Theobald bishop of Arezzo, prefixed to the *Micrologus*; and yet the writers on music speak of the *Micrologus* as a book in the hands of every one. Martini cites several manuscripts of Guido; namely, two in the Ambrosian library at Milan, the one written about the 12th century, the other less ancient; another among the archives of the chapter of Pistoja, a city in Tuscany; and a third in the Mediceo-Laurenziano library at Florence, of the 15th century: these are clearly the *Micrologus*. Of the epistle to Michael of Pomposa, together with the *Argumentum novi Cantus inveniendi*, he mentions only one, which he says is somewhere at Ratibon. Of the several tracts above mentioned, the last excepted, a manuscript is extant in the library of Balliol College in Oxford. Several fragments of the two first, in one volume, are also among the Harleian manuscripts now in the British Museum, No. 3199; but so very much mutilated, that they afford but small satisfaction to a curious enquirer.

ARETIN (Leonard), one of the most learned men of the 15th century, was secretary to the republic of Florence, and translated from the Greek into Latin some of the Lives of Plutarch, and Aristotle's Ethics: he also composed three books of the Punic war, that may serve as a supplement to those wanting in Livy; the history of the transactions in Italy during his time; that of ancient Greece; that of the Goths; that of the republic of Florence; and many other books. He died in 1443, aged 74.

ARETIN (Francis), a man of great reading, and well acquainted with the Greek language. He translated into Latin the Commentaries of St. Chrysostom upon St. John, and about twenty Homilies of the same father: he also translated the Letters of Phalaris into Latin, and wrote a treatise *De balneis Puteolanis*. He studied at Sienna, about the year 1443; and afterwards taught law there with such reputation, that they called him the *Prince of Subtleties*, and his wit became a proverb. He displayed his talents chiefly in disputes, in which nobody could withstand him. He gave his opinions in law with so much confidence, as to assure those who consulted him, that they should carry their cause: nor did experience contradict him; for it was a common saying at the bar, such a cause has been condemned by Aretin, it must therefore be lost. He taught also in the university of Pisa, and in that of Ferrara. He was at Rome under the pontificate of Sixtus IV. but did not stay here long; for he soon perceived that the great hopes which he had built upon his reputation would come to nothing. This pope, however, declared he would have given him a cardinal's hat, had he not thought he should have done a public injury by depriving the youth of such an excellent professor. When old age would not permit him to go through the duties of his office, they dispensed with his reading of lectures, and his salary was continued. He continued, however, sometimes to mount the chair; and although his lectures had now but little spirit in them, yet he had still many hearers on account of his reputation. One day when the students were gone to some public shows, there were but forty persons in his auditory: which so mortified him, that he threw away his book; and cried out, "Aretin shall never explain law to a few persons," retired in a passion, and would teach no more. He was severe in his temper, and never kept a servant longer than a month or two; for it was a maxim of his, "That new-hired servants always serve best." He was honoured with the title of *knight*, and spent all his life in celibacy; and his way of living was so parsimonious, that he was thereby enabled to amass a great deal of wealth. He had designed this wealth for the maintenance of a college; but he altered his resolution, and left it to his relations.

ARETIN (Peter), a native of Arezzo, who lived in the 16th

century. He was famous for his satirical writings; and was so bold as to carry his invectives even against sovereigns, and from thence got the title of the *Scourge of Princes*. Francis I. the Emperor Charles V. most of the princes of Italy, several cardinals, and many noblemen, courted his friendship by presents, either because they liked his compositions, or perhaps from an apprehension of falling under the lash of his satire. Aretin became thereupon so insolent that he is said to have got a medal struck, on one side of which he is represented with these words *IL DIVINO ARETINO*; and on the reverse, sitting upon a throne, receiving the presents of princes, with these words, *I PRINCIPI TRIBUTATI DA POPOLI, TRIBUTANO IL SERVITOR LORO*. Some imagine that he gave himself the title of *Divine*, signifying thereby that he performed the functions of a god upon earth, by the thunderbolts with which he struck the heads of the highest personages. He used to boast, that his lampoons did more service to the world than sermons; and it was said of him, that he had subjected more princes by his pen, than the greatest had ever done by their arms. Aretin wrote many irreligious and obscene pieces; such are his dialogues, which are called *Ragionamenti*. There is likewise imputed to him another very obscene performance, *De Omnis Veneris Ichematibus*. "It was about the year 1525 (says Mr. Chevallier), that Julio Romano, the most famous painter of Italy, infligated by the enemy of the salvation of mankind, invented drawings to engrave 20 plates: the subjects are so immodest, that I dare only name them. Peter Aretin composed sonnets for each figure. George Vasari, who relates this in his *Lives of the Painters*, says, he does not know which would be the greatest impurity, to cast one's eyes upon the drawings of Julio, or to dip into the verses of Aretin." Some say that Aretin changed his libertine principles; but however this may be, it is certain that he composed several pieces of devotion. He wrote a Paraphrase on the penitential Psalms, and another on Genesis; he wrote also the Life of the Virgin Mary, and that of St. Catherine of Siena, and of St. Thomas Aquinas. He was author likewise of some comedies. He died in the year 1556, being about 65 years old.

ARGALL (John), was the third son of Thomas Argall, by Margaret his wife, daughter of John Talkarne of the county of Cornwall. He was born in London, and entered a student in Christ-church, in Oxford, towards the latter end of Queen Mary's reign. He took the degree of master of arts in 1565, and was senior of the act celebrated the eighteenth of February the same year. Afterwards he applied himself to the study of divinity, and having taken holy orders, obtained the living of Haleworth in Suffolk. Being at a feast at Cheffon, a mile distant from that town, he died suddenly at the table. His body was carried to Haleworth, and buried there, Oct. 8, 1606. During his stay at the university, he was a noted disputant, and a great actor of plays at Christ-church, particularly when the queen was entertained there in 1566. He was esteemed a very good scholar, and was so much devoted to his studies that he lived and died like a philosopher, with a thorough contempt for the things of this world. He was the author of two tracts, the one entitled "De vera Penitentia, the other "Introductio ad Artem Dialecticam."

ARGEIA, or *Argolis*, a district of Peloponnesus, situated between Arcadia to the west, the Egean Sea to the east, Laconica and the Sinus Argolicus to the south, and to the north the territory of Corinth and the Sinus Saronicus (Livy, Ptolemy); so called from Argos the capital: now *Romania di Morea*.

ARGEIL, a people of Greece, so called by the Greeks, from *Argi*, or *Argus*; *Argui*, by the Romans: Homer seems to call the Greeks in general *Argei*, as also *Achei*.

ARGENS (Jean Baptiste de Boyer, marquis de), a French

writer, famous for the number of his productions, was born at Aix in Provence, in 1704. His talents shewed themselves early, and his father intended him for the magistracy; but a gallant and voluptuous humour disposed him rather to the military, in which he served some time. Disgusted, however, with this profession, he passed into Holland, and devoted himself to the exercise of the pen; when the King of Prussia gave him an invitation, and attached him to him in quality of chamberlain. After having spent about five-and-twenty years with this monarch, he began to look towards his native country, and returned to Aix, where he lived like a philosopher; and died at the end of 1770. He had an ardent desire of knowledge, and knew a great deal. He was master of many languages: he painted very well; and was a considerable proficient in anatomy and chemistry. His works are very well known to the public, the principal of which are "Lettres Juives, Lettres Chinoises, Lettres Cabalistiques, Philosophie du bon Sens," &c. &c. He translated also from the Greek into French, "Ocellus Lucanus," and "Julian's Discourse upon Paganism." There is learning, knowledge, and good sense, scattered through all his writings; but they are very little favourable to religion; on the contrary, they are strongly tinged with libertinism.

ARGENTARIA, a town of ancient Gaul, thought to stand in the place where the city Colmar now stands. It is remarkable for a great victory gained by the emperor Gratian over the Lentiens, in the month of May, A.D. 378. The Romans, being but few in number, were at first overpowered, and obliged to give ground; but soon returning to the charge, they gained in the end a complete victory. Thirty thousand of the barbarians, and among the rest their king Tiarus, were killed on the spot; and all the rest, except 5000, taken prisoners.

ARGENTIERE, a town of France, in the late province of Provence, now a district of the department of Ardeche. It is five miles S.W. of Aubenas, and 17 W. of Viviers. Long. 4. 22. E. Lat. 44. 30. N.

ARGENTORA, *Argentum* (Notitia); *Argentoratum* (Ptolemy); *Argentoratus* (Ammian); a city of the Tribocci; one of the fifty forts built by Drusus on the Rhine (Florus): an appellation formed by the Romans from the German, *Argen Straffen*, or *Stralen*, "unsafe roads for travellers," from the marauding parties of the garriſons that infested the roads. Now *Strasbourg*, in the lower Alsace, on the rivulet Ill, near the Rhine. E. Long. 7. 35. Lat. 48. 38.

ARGIPPEANS, a part of the ancient Scythian nation. The men and the women were bald, hump-backed, and had great chins. Their language was totally peculiar to themselves. Their dress was the same with that of the other Scythians. Their food was the fruit of a tree called *Pontica*, about as high as a fig-tree: it bore a kind of filbert; the kernel of which in form resembled a bean. They sucked from it a thick black liquor; and this liquor they sometimes drank with milk. The groffer part of this fruit, after it had been pressed, served them instead of animal food; for they had but few cattle, and were therefore unskilled in the care of flocks and herds. They lay in winter under trees, over which they spread a white covering; this covering they used not in the summer. None dared to offer them any injury; for they were deemed sacred. Therefore they had no arms; and were unacquainted with the art of war. They determined the differences and disputes of their neighbours; and whoever fled to them from persecution, found a safe asylum; it would have been sacrilege to hurt, to insult him in their country.

ARGIVI (*Encycl.*). For the subject referred to, but accidentally omitted, see ARGÆIA, in this Supplement.

ARGOS, an ancient name of Peloponnesus; from Argos, one of the kings. (Homer. Strabo.)

ARGOS, the capital, and an inland town, of Argolis. It had different furnames; as *Achaicum*, from the country, or an ancient people (Homer); *Inachus*, from the river Inachus, which runs by (Pliny); &c. It had two citadels (Livy); the one called *Larissa* (Strabo); the other unnamed. At the siege of this city, Pyrrhus king of Epirus was killed by a tile thrown by an old woman. ARGOS was 26 stadia distant from Temenium, a maritime town, and 50 to the south of Mycenæ: now *Argo*. E. Long. 23. 5. Lat. 37. 30.

ARGOS HIPPIUM, the ancient name of *Arpi*; but *Lampe* is a still more ancient; afterwards called *Argyrippa*, and *Argippa*; built by, and the residence of, Diomedes, on the Cerebalus (Virgil); afterwards a large and populous city (Livy). A town of Apulia; now in ruins, and the place called *Arpe*.

ARGOSTOL, a seaport of the isle of Cefalonia, over-against Albania. It is the best harbour in all the island, and the provisor resides in the fortrefs, which is five miles distant.

ARGUN, a river of Asia, which divides the Russian from the Chinese empire.

ARGUN, a town of Eastern Tartary, on the frontiers of the Chinese empire. There are mines of silver and lead near it; and a pearl fishery in the river Argun. Long. 103. 56. E. Lat. 42. 30. N.

ARGYROPOEIA, among alchemists, a pretended art of transmuting or changing other metals into silver.

ARGYROPYLUS (Joannes), one of the first of those learned persons, who fled into Italy upon the taking of Constantinople by Mahomet II. in 1453, and contributed to the revival of the Greek learning in the west. Cosimo de Medicis, duke of Tuscany, made him professor of Greek at Florence, and appointed him preceptor to his son Peter, and to his grandson Laurence. He had several illustrious pupils at Florence, to whom he read lectures in the Greek language and philosophy; and among the rest Angelus Politianus. In 1456 he went into France, to implore the assistance of Charles VII. in behalf of some friends and relations, whom he wanted to redeem from Turkish slavery. He continued many years in his professorship at Florence; but the plague at length obliging him to quit it, he went to Rome, where he publicly read lectures upon the Greek text of Aristotle. He was carried off by an autumnal fever, which he got by an intemperate eating of melons, in the 70th year of his age, and about the year 1480.

ARGYRUNTUM, a maritime town of Illyria (Ptolemy, Pliny). Now Novigrad, a town of Dalmatia. E. Long. 17. 30. Lat. 44. 30.

ARIANO, a town of Italy, in the Ferrarese, on a branch of the river Po, 22 miles N. E. of Ferrara. Long. 12. 8. E. Lat. 45. 0. N.

ARIAS MONTANUS, a learned Spanish divine, employed by Philip II. of Spain to publish another edition of the Bible, after that of Cardinal Ximenes; which he finished with applause, and died at Seville in 1598.

ARICONIUM, a town of the Silures (Antonine); near Hereford (Camden). W. Long. 2. 42. Lat. 52. 6.

ARIMASPI (Pliny), a people of Sarmatia Europea, to the south of the Montes Rhipæi, said by Mela to have but one eye; a fable broached by Aristeas Proconnesius, according to Herodotus.

ARIMINUM, a town of Umbria, or Romagna, at the mouth of the Ariminus, on the Gulf of Venice. The seizing on by Cæsar gave rise to the civil war. Now called *Rimini*. E. Long. 13. 30. Lat. 44. 8.

ARION, an excellent musician and poet, inventor of dithyrambs. Periander entertained him at his court, where getting an estate, and returning to Corinth, the sailors, for

lucre of his money, threw him into the sea; when according to the poets, a dolphin, charmed with his music, took him on her back and carried him safe to shore.

ARISTANDER, a famous foothfayer under Alexander the Great, over whom he gained a wonderful influence by the good success of his art. He had already had the same employment at the court of King Philip; and it was he who explained better than his brethren the dream that this prince had after having married Olympias.

ARISTARCHUS, a Grecian philosopher of Samos, one of the first that maintained that the earth turns upon its own centre. We are not sure of the age in which he lived; and have none of his works but a *Treatise of the Greatness and Distance of the Sun and Moon*, translated into Latin by Frederic Commandine, and published with Pappus's explanations in 1572.

ARISTARCHUS, a celebrated grammarian, much esteemed by Ptolemy Philometor, who committed to him the education of his son. He applied himself chiefly to criticism, and made a revival of Homer's poems, but in too magisterial a way; for such verses as he did not like he treated as spurious. He commented on other poets. Cicero and Horace made use of his name to express a very rigid critic.

ARISTIDES, surnamed the *Just*, flourished at Athens at the same time with Themistocles, who triumphed over him by his boisterous eloquence, and got him banished, 483 years before Christ; but Aristides being recalled a short time after, would never join with the enemies of Themistocles, to get him banished; for nothing could make him deviate from the strictest rules of moderation and justice. Aristides brought the Greeks to unite against the Persians; distinguished himself at the famous battle of Marathon, and that of Salamine and Platea; and established an annual income of 460 talents for a fund to supply the expenses of war. This great man died poor, though he had the management of the revenues of Greece, that the state was obliged to pay his funeral expences, to give fortunes to his daughters in marriage, and a maintenance to his son Lyfianachus.

ARISTIDES of Miletus, a famous Greek author, often cited by the ancients.

ARISTIDES, a very eloquent Athenian orator, who became a convert to the Christian religion, and about the year 124 presented to the Emperor Adrian an apology for the Christians.

ARISTIDES (Ælius), a celebrated orator, born in Mysia, about 129 years before the Christian æra. The best edition of his works is that of Oxford, printed in Greek and Latin, in two volumes quarto.

ARISTIDES, a painter contemporary with Apelles, flourished at Thebes about the 122d Olympiad. He is said to have been the first who attempted to delineate the passions of the mind in colours. His Bacchus was so excellent a piece, as to become proverbial.

ARISTIPPUS, the founder of the Cyrenaic sect of philosophy, was the son of Aretades, and born at Cyrene in Libya. He flourished about the 96th Olympiad. The great reputation of Socrates induced him to leave his own country, and remove to Athens, that he might have the satisfaction of hearing his discourses. He was chiefly delighted with those discourses of Socrates that related the most to pleasure; which he asserted to be the ultimate end in which all happiness consists. His manner of life was agreeable to his opinion; for he indulged himself extremely in all the luxuries of dress, wine, and women. Though he had a good estate, and three country seats, yet he was the

only one of the disciples of Socrates who took money for teaching: which being observed by the philosopher, he asked Aristippus, How he came to have so much? Who in reply asked him, How he came to have so little? Upon his leaving Socrates, he went to Ægina, as Athenæus informs us, where he lived with more freedom and luxury than before. Socrates sent frequent exhortations to him, in order to reclaim him; but all in vain: and with the same view he published that discourse which we find in Xenophon. Here Aristippus became acquainted with Leis, the famous courtesan of Corinth; for whose sake he took a voyage to that city. He continued at Ægina till the death of Socrates, as appears from Plato's *Phædo*, and the epistle which he wrote upon that occasion. He returned at last into his own country Cyrene, where he professed philosophy, and instituted a sect which, as we observed above, was called the *Cyrenaic*, from the place, and by some writers the *Hedonic*, or voluptuous; from its doctrines. During the height of the grandeur of Dionysius the Sicilian tyrant, a great many philosophers resorted to him; and among the rest Aristippus, who was tempted thither by the magnificence of that court. Dionysius asking him the reason of his coming, he replied, "That it was in order to give what he had, and to receive what he had not;" or, as others represent it, "That when he wanted wisdom, he went to Socrates; but now as he wanted money, he was come to him." He very soon insinuated himself into the favour of Dionysius; for, being a man of a soft easy temper, he conformed himself exactly to every place, time, and person, and was a complete master of the most refined complaisance.

We have several remarkable passages concerning him during his residence at that court, mentioned by Diogenes Laertius. Dionysius, at a feast, commanded that all should put on women's purple habits, and dance in them. But Plato refused, repeating these lines:

I cannot in this gay effeminate dress
Disgrace my manhood, or my sex betray.

But Aristippus readily submitted to the command, and made this reply immediately:

—At feasts, where mirth is free,
A sober mind can never be corrupted.

At another time, interceding with Dionysius in behalf of a friend, but not prevailing, he cast himself at his feet: being reproved by one for that excess of humility, he replied, "That it was not he who was the cause of that submission; but Dionysius, whose ears were in his feet." Dionysius shewed him three beautiful courtesans, and ordered him to take his choice. Upon which, he took them all three away with him, alleging, that Paris was punished for preferring one to the other two; but when he had brought them to his door, he dismissed them, in order to shew that he could either enjoy or reject with the same indifference. Having desired money of Dionysius, the latter observed to him, that he had assured him a wife man wanted nothing. "Give me (says he) what I ask, and we will talk of that afterwards." When Dionysius had given it him, "Now (says he), you see I do not want." By this complaisance he gained so much upon Dionysius, that he had a greater regard for him than for all the rest of the philosophers, though he sometimes spoke with such freedom to that king, that he incurred his displeasure. When Dionysius asked, Why philosophers haunted the gates of rich men, but not rich men those of philosophers? he replied, "Because the latter know what they want, and the others not." Another time, Dionysius repeating (out of Sophocles, as Plutarch affirms, who ascribes this to Zeno) these verses,

He that with tyrants seeks for bare support,
Enslaves himself, though free he came to court;

he immediately answered,

He is no slave, if he be free to come.

Diocles, as Laertius informs us, related this in his *Lives of the Philosophers*; though others ascribe this saying to Plato. Aristippus had a contest with Antisthenes, the Cynic philosopher; notwithstanding which, he was very ready to employ his interest at court for some friends of Antisthenes, to preserve them from death, as we find by a letter of his to that philosopher. Diogenes followed the example of his master Antisthenes in ridiculing Aristippus, and called him the *court-spaniel*.

We have many apophthegms of his preserved. Suidas observes, that he surpassed all the philosophers in the acuteness of his apophthegms. Being once rallied at, he left the room; and the person who abused him, following him, and asking him why he went away, he answered, "Because it is in your power to rail, but it is not in my power not to hear you." A person observing, that the philosophers frequented the houses of rich men; "Why (says he), the physicians frequent the chambers of the sick, yet that is no reason why a man should rather choose to lie sick than be cured." To one who boasted of his great reading, he said, "That as they who feed and exercise most are not always more healthy than they who only eat and exercise to satisfy nature; so neither they who read much, but they who read no more than is useful, are truly learned." Among other instructions which he gave to his daughter Arete, he advised her particularly to despise superfluity. To one who asked him what his son would be the better for being a scholar? "If for nothing else (said he), yet for this alone, that when he comes into the theatre, one stone will not fit upon another." When a certain person recommended his son to him, he demanded 200 drachmas; and upon the father's replying, that he could buy a slave for that sum, "Do so (said he), and then you'll be master of a couple." Being reproached, because, having a suit of law depending, he fed a lawyer to plead for him, "Just so (said he), when I have a great supper to make, I always hire a cook." Being asked what was the difference between a wife man and a fool, he replied, "Send both of them together naked to those who are acquainted with neither of them, and then you'll know." Being reproved by a certain person (who, according to Mr. Stanley, was Plato) for his costly and voluptuous feasts, "I warrant you (said he), that you would not have bestowed three farthings upon such a dinner;" which the other confessing, "Why then (said he) I find myself less indulgent to my palate, than you are to your covetous humour;" or, as it is otherwise represented, "I find, that I love my belly, and you love your money." When Simus, treasurer to Dionysius, shewed him his house magnificently furnished, and paved with costly marble (for he was a Phrygian, and consequently profuse); Aristippus spit in his face: upon which the other growing angry, "Why, truly (said he), I could not find a fitter place." His servant carrying after him a great weight of money, and being ready to sink upon the road under his burden, he bid him throw away all what was too much for him to carry. Horace mentions this fact in his third satire of the second book:

Quid simile isti

Græcus Aristippus? qui servos projicere aurum
In media jussit Libya, quia tarasius irent
Propter onus segnes.

Being asked what things were most proper for children to be instructed in? he answered, "Those which might prove of

the greatest advantage to them when they came to be men." Being reproached for going from Socrates to Dionyſius, he replied, "That he went to Socrates when he wanted ſerious inſtruction, and to Dionyſius for diverſion." Having received money of Dionyſius at the ſame time that Plato accepted a book only, and being reproached for it, "The reaſon is plain (lays he), I want money, and Plato wants books." Having loſt a conſiderable farm, he ſaid to one who ſeemed exceſſively to compaſſionate his loſs, "You have but one field; I have three left: why ſhould not I rather grieve for you?" Plutarch, who relates this in his book *De Tranquillitate Animi*, obſerves upon it, that it is very abſurd to lament for what is loſt, and not to rejoice for what is left. When a perſon told him, "That the land for his ſake was loſt," he replied, "That it was better fo, than that he ſhould be loſt for the land." Being caſt by ſhipwreck aſhore on the iſland of Rhodes, and perceiving mathematical ſchemes and diagrams drawn upon the ground, he ſaid, "Courage, friends; for I ſee the footſteps of men."

After he had lived a long time with Dionyſius, his daughter Arete ſent to him, to deſire his preſence at Cyrene, in order to take care of her affairs, ſince he was in danger of being oppreſſed by the magiſtrates. But he fell ſick in his return home, and died at Lipara, an Æolian iſland. With regard to his principal opinions, like Socrates, he rejected the ſciences as they were then taught, and pretended that logic alone was ſufficient to teach truth and fix its bounds. He aſſerted, that pleaſure and pain were the criterions by which we were to be determined; that theſe alone made up all our paſſions; that the firſt produced all the ſoft emotions, and the latter all the violent ones. The aſſemblage of all pleaſure, he aſſerted, made true happineſs, and that the beſt way to attain this was to enjoy the preſent moments. He wrote a great many books; particularly the Hiſtory of Libya, dedicated to Dionyſius; ſeveral Dialogues; and four books Of the Luxury of the Ancients. There are four epiſtles of his extant in the Socratic Collection publiſhed by Leo Allatius.

Befides Arete his daughter, whom he educated in philoſophy, Ariſtippus had alſo a ſon, whom he diſinherited for his ſtupidity. Arete had a ſon, who was named *Ariſtippus* from his grandfather, and had the ſurname of *Μετρίππας* from his mother's inſtructing him in philoſophy. Among his auditors, beſides his daughter Arete, we have an account of Æthiops of Ptolemais, and Antipater of Cyrene. Arete communicated the philoſophy, which he received from her father, to her ſon Ariſtippus, who transmitted it to Theodorus the *Atheiſt*, who inſtituted the ſect called *Theodorean*. Antipater communicated the philoſophy of Ariſtippus to Epitímedes his diſciple; Epitímedes to Paræbates; Paræbates to Heggeſias and Anniceris; and theſe two laſt, improving it by ſome additions of their own, obtained the honour each of them of giving a name to the *Heggeſiac* and *Annicerian* ſects.

Laertius mentions two other perſons of the name of Ariſtippus; one, who wrote the Hiſtory of Arcadia; the other, a philoſopher of the New Academy.

ARISTO, a Stoic philoſopher, the diſciple of Zeno the chief of the Stoics, flouriſhed about 290 years before the Chriſtian æra. He differed but little from his maſter Zeno. He rejected logic as of no uſe, and natural philoſophy as being above the reach of the human underſtanding. It is ſaid, that being bald, the ſun burnt his head; and that this cauſed his death. There is a ſaying of his recorded, which might render the doctrine of Ariſtippus leſs odious than it ordinarily is (ſee *ARISTIPPUS*). He uſed to ſay, "That a philoſopher might do thoſe of his hearers a prejudice who put a wrong interpretation upon good meanings; as for example, that the ſchool of Ariſtippus might

ſend out debauchees, and that of Zeno Cynics;" which ſeems to imply, that the doctrine of this philoſopher never produced this effect but when it was miſunderſtood. He ſhould alſo have added, that every teacher is therefore obliged to forbear laying down ambiguous maxims, or to prevent falſe gloſſes being put upon them.

ARISTO (Titus), a Roman lawyer, perfect maſter of the public and civil law, of hiſtory and antiquity. The Pandects mention ſome books of his, as does Aulus Gellius.—He was contemporary with Pliny the Younger, who gives him a noble character, and had a moſt tender friendſhip for him. See *Plinii Epist.* lib. i. ep. 22.

ARISTOGITON, a famous Athenian, who, with Armodius, killed Hipparchus, tyrant of Athens, about 513 years before the Chriſtian æra. The Athenians erected a ſtatue to him.

ARISTOMENES, a general of the Meſſenians, renowned for his valour and virtue.

ARISTOTLE (*Encycl.*), beſides his treatiſes on philoſophy, wrote alſo on poetry, rhetoric, law, &c. to the number of 400 treatiſes, according to Diogenes Laertius; or more, according to Francis Patricius of Venice. An account of ſuch as are extant, and of thoſe ſaid to be loſt, may be ſeen in Fabricius's *Bibliotheca Græca*. He left his writings with Theophrastus, his beloved diſciple and ſucceſſor in the Lyceum; and forbade that they ſhould ever be publiſhed. Theophrastus, at his death, truſted them to Neleus, his good friend and diſciple; whoſe heirs buried them in the ground at Scepsis, a town of Troas, to ſecure them from the king of Pergamus, who made great ſearch every-where for books to adorn his library. Here they lay concealed 160 years, until, being almoſt ſpoiled, they were fold to one Apellicon, a rich citizen of Athens. Sylla found them at this man's houſe, and ordered them to be carried to Rome. They were ſome time after purchaſed by Tyrannium a grammarian; and Andronicus of Rhodes having bought them of his heirs, was in a manner the firſt reſtorer of the works of this great philoſopher; for he not only repaired what had been decayed by time and ill-keeping, but alſo put them in a better order, and got them copied. There were many who followed the doctrine of Ariſtotle in the reigns of the twelve Cæſars, and their numbers increaſed much under Adrian and Antoninus: Alexander Aphrodiſus was the firſt profeſſor of the Peripatetic philoſophy at Rome, being appointed by the emperors Marcus Aurelius and Lucius Verus; and in ſucceeding ages the doctrine of Ariſtotle prevailed among almoſt all men of letters, and many commentaries were written upon his works.

The firſt doctors of the church diſapproved of the doctrine of Ariſtotle, as allowing too much to reaſon and ſenſe; but Anatolius biſhop of Laodicea, Didymus of Alexandria, St. Jerome, St. Auguſtin, and ſeveral others, at length wrote and ſpoke in favour of it. In the ſixth age, Boethius made him known in the weſt, and tranſlated ſome of his pieces into Latin. But from the time of Boethius to the eighth age, Joannes Damascenus was the only man who made an abridgement of his philoſophy, or wrote any thing concerning him. The Grecians, who took great pains to reſtore learning in the 11th and following ages, applied much to the works of this philoſopher, and many learned men wrote commentaries on his writings: amongſt theſe were Alfarabius, Algazel, Avicenna, and Averoes. They taught his doctrine in Africa, and afterwards at Cordova in Spain. The Spaniards introduced his doctrine into France, with the commentaries of Averoes and Avicenna; and it was taught in the univerſity of Paris, until Amauri, having ſupported ſome particular tenets on the principles of this philoſopher, was condemned of hereſy, in a coun-

cil held there in 1210, when all the works of Aristotle that could be found were burnt, and the reading of them forbidden under pain of excommunication. This prohibition was confirmed, as to the physics and metaphysics, in 1215, by the Pope's legate; though at the same time he gave leave for his logic to be read, instead of St. Augustin's used at that time in the university. In the year 1265, Simon, cardinal of St. Cecil, and legate from the holy see, prohibited the reading of the physics and metaphysics of Aristotle. All these prohibitions, however, were taken off in 1366; for the cardinals of St. Mark and St. Martin, who were deputed by Pope Urban V. to reform the university of Paris, permitted the reading of those books, which had been prohibited: and in the year 1448, Pope Stephen approved of all his works, and took care to have a new translation of them into Latin.

Passing from hand to hand, in the manner above mentioned, the works of Aristotle have greatly suffered from the ignorance or the inaccuracy of transcribers. This has given birth to much obscurity, and to omissions that are now irreparable: it is this which has rendered the sense of Aristotle so doubtful, and opened such a wide field for the combats of scholastic philosophy. Besides, our philosopher was not himself very much inclined to be perfectly plain and familiar. His style was difficult and concise. He has employed a mathematical manner of communication; often uses terms which have no determinate meaning; and, with many of his doctrines, he mixes ancient opinions as taken for granted, which are altogether false or uncertain. In a word, the Peripatetic philosophy is very obscure in itself, and commentators have rather contributed to increase the obscurity.

ARISTOXENUS, the most ancient musical writer, of whose works any traces are come down to us. He was born at Tarentum, a city in that part of Italy called *Magna Græcia*, now Calabria. He was the son of a musician, whom some call *Mnesias*, others *Spintharus*. He had his first education at Mantinea, a city of Arcadia, under his father, and Lamprus of Erythra; he next studied under Xenophilus, the Pythagorean; and lastly under Aristotle, in company with Theophrastus. Suidas, from whom these particulars are transcribed, adds, that Aristoxenus, enraged at Aristotle having bequeathed his school to Theophrastus, traduced him ever after. But Aristotles the Peripatetic, in Eusebius, exculpates Aristoxenus in this particular, and assures us that he always spoke with great respect of his master Aristotle. From the preceding account it appears that Aristoxenus lived under Alexander the Great, and his first successors. His *Harmonics* in three books, all that are come down to us, together with Ptolemy's *Harmonies*, were first published by Gogavinus, but not very correctly, at Venice, 1562, in 4to, with a Latin version. John Meurinus next translated the three books of Aristoxenus into Latin, from the MS. of Jos. Scaliger; but, according to Meibomius, very negligently. With these he printed at Leyden, 1616, 4to. Nicomachus and Alypius, two other Greek writers on music. After this, Meibomius collected these musical writers together; to which he added Euclid, Bacchius senior, Aristides Quintilianus; and published the whole, with a Latin version and notes, from the elegant press of Elzevir, Amst. 1652. The learned editor dedicates these ancient musical treatises to Christina queen of Sweden. Aristoxenus is said by Suidas to have written 452 different works, among which those on music were the most esteemed; yet his writings on other subjects are very frequently quoted by ancient authors, notwithstanding Cicero and some others say that he was a bad philosopher, and had nothing in his head but music. The titles of several of the lost works of Aristoxenus, quoted by Athenæus and others, have been collected by Meur-

sius in his notes upon this author, by Tossius and Menage, all which Fabricius has digested into alphabetical order.

ARLESHEM, a handsome town of Switzerland, in the bishopric of Basle, where the canons of that city reside.

ARMACALES, a river of Babylon (Abydenus); called *Fessa Regia*, the *Royal Trench*, or *Cut* (Polybius); the *Royal River* (Ptolemy); *Almarachur* (Pliny); *Naarmalcha* (Ammian); a factitious channel, or cut, made by Nebuchadonofor, and a horn or branch of the Euphrates (Abydenus). The Euphrates naturally divides into two channels, one passing through Babylon, the other through Seleucia, and then falls into the Tigris; the factitious channel between these two is the Royal River; which mixes with the Tigris, a great deal lower down than Seleucia, at Apamea (Ptolemy).

ARMAGH, a city of Ireland, and capital of the county so called, the see of an archbishop, who is lord primate of all Ireland. St. Patrick founded the see in the year 444. This city was much decayed, but by the munificence of Lord Rokeby, the archbishop, it has been considerably increased; he has built a handsome palace, and a noble house for the school, which is a royal foundation; to which he added a public library for the promotion of science. He has also erected an observatory, with a liberal income for an astronomer, securing the endowments by several acts of the legislature; 62 miles N. Dublin, and 46 S. S. E. Londonderry. Long. 6. 35. W. Greenwich. Lat. 54. 21. N.

ARMENE, or ARMINA, anciently a hamlet of Paplagonia (Ptolemy). The inhabitants encompassed it with a wall, because of the coldness of the place, imagining by that means to render it warmer. But this proving ineffectual, gave rise to the proverb *Armenen muro cingere*, used to express some egregious folly.

ARMENIA (*Encycl.*). The Armenians are an honest, civil, polite people, scarce troubling themselves about any thing else but trade, which they carry on in most parts of the world, by which means they have spread themselves over the east, and also great part of Europe; and wherever they come, commerce is carried on with spirit and advantage.

The religion of the Armenians is the Christian, of the Eutychian sect: that is, they own but one nature in Jesus Christ; and when they speak of the hypostatical union, that he is perfect God and perfect man without mixture. They have a high esteem for a book they call the *Little Gospel*, which treats of the infancy of Jesus, and says that the Virgin Mary being pregnant, her sister Salome accused her of having prostituted herself; to which the Virgin answered, that she needed only to lay her hand on her belly, and the world know how she came to be with child: this Salome accordingly did, and fire came out of her belly, which consumed the half of her arm; upon which she acknowledged her fault, and drew it back: after which it was healed by putting it to the same place.

The Armenian clergy consist of patriarchs, archbishops, doctors, secular priests, and monks. The secular priests are not allowed to marry a second time; and therefore they take care to choose young healthy wives: they maintain themselves and families by following some occupation, inasmuch, that they have hardly time to perform their ecclesiastical functions: they lie in the churches on the vigils of those days they are obliged to officiate.

The Armenian monks are of the order of St. Basil; and every Wednesday and Friday they eat neither fish, nor eggs, nor oil, nor any thing made of milk, and during Lent they live upon nothing but roots: they are allowed wine only on the Saturday in the Holy Week, and meat on the Easter Sunday. Besides the great Lent, they have four others of eight

days each, which are instituted to prepare for the four great festivals of the Nativity, the Ascension, the Annunciation, and of St. George; in which times they must not so much as speak of eggs, fish, oil, or butter.

The Armenians have seven sacraments; baptism, confirmation, penance, the eucharist, extreme unction, orders, and matrimony. In baptism, the child is plunged three times into the water, and the same form of words that is used with us is repeated every time; the priest then puts a small cord made with silk and cotton on the neck of the infant, and anoints his forehead, chin, stomach, arm-pits, hands, and feet, making the sign of the cross on each part. When the child is baptized, he is carried home by the godfather with the sound of drums and trumpets. The women do not go to church till forty days after their delivery; and they observe many Jewish customs.

At the communion, to which infants of two or three months old are admitted, the priests give a piece of the consecrated host, soaked in the consecrated wine. The elements are covered with a great veil, and placed in a cup-board near the altar, on the side of the gospels. When the priest takes the chalice and paten, he is followed by his deacons, and sub-deacons, with flambeaux and plates of copper furnished with bells: in this manner, with a censer before him, he goes in procession round the sanctuary; he then sets them on the altar, pronounces the words of consecration, and turns himself to the people, who fall down, kiss the earth, and beat their breasts: then, after taking it himself, he distributes the host soaked in wine to the people.

The Armenians seem to place the chief part of their religion in fastings and abstinences: and among the clergy, the higher the degree, the lower they must live; inasmuch that it is said the archbishops live on nothing but pulse. They consecrate holy water but once a-year, at which time every one fills his pot and carries it home, which brings in a considerable revenue to the church.

ARMINIUS (James), whose real name in Low Dutch was James Harmanni, a famous Protestant divine, from whom the modern sect of Arminians take their name, was born at Oude-water, in Holland, in 1560. He was ordained minister at Amsterdam on the 11th of August, 1588; when he soon distinguished himself by his sermons, which were remarkable for their solidity and learning, and gained him universal applause: but Martin Lydias, professor of divinity at Franeker, judging him a fit person to refute a writing in which Beza's doctrine of predestination had been attacked by some ministers of Delft, Arminius at his intreaties undertook the task; but upon thoroughly examining the reasons on both sides, he came into the opinions he proposed to destroy, and afterwards went still farther than the ministers of Delft had done. In 1600 he opposed those who maintained that ministers should subscribe the confession and catechism every year. In 1602 a pestilential disease raged at Amsterdam, during which he acted with the greatest resolution and courage, in assisting the poor, and comforting the sick; and Lucas Trelocatius and Francis Junius dying of that disease at Leyden, the curators of that university chose Arminius professor of divinity there, and he was afterwards made doctor of divinity. Disputes upon grace were soon after kindled in that university; and he was at length engaged in a new contest, occasioned by a disputation of his concerning the divinity of the Son. These contests, his continual labour, and the concern of seeing his reputation blasted by a multitude of slanders in relation to his opinions, impaired his health, and threw him into a fit of sickness, of which he died on the 19th of October, 1609.

Arminius was esteemed an excellent preacher: his voice was low, but very agreeable; and his pronunciation admir-

able: he was easy and affable to persons of all ranks, and facetious in his conversation amongst his friends. His great desire was, that Christians would bear with one another in all controversies which did not affect the fundamentals of their religion; and when they persecuted each other for points of indifference, it gave him the utmost dissatisfaction. The curators of the university of Leyden had so great a regard for him, that they settled a pension upon his wife and children.

He left several works, viz. 1. *Disputationes de diversis Christiane religionis capitulis*. 2. *Orationes, itemque tractatus insigniores aliquot*. 3. *Examen modeste libelli Guilielmi Perkinii de predestinationis modo et ordine, itemque de amplitudine gratiae divinae*. 4. *Analysis capitis noni ad Romanos*. 5. *Differtatio de vero et genuino sensu capitis septimi epistolae ad Romanos*. 6. *Amica collatio cum D. Francisco Junio de predestinatione per litteras habita*. 7. *Epistola ad Hippolytum a collibus*.

ARMOZA, or HARMOZIA, a town in Carmania, at the mouth of the Anamis, which falls into the Persian Gulf (Arrian); *Arnuza* (Ptolemy); and from this the neighbouring island, and a small kingdom, take the modern name of *Ormuz*. E. long. 56. 17. N. lat. 27. 20.

ARMSTRONG (*Encycl.*), like Akenfide, another poet and physician, never arrived at much practice. In 1735 he published a little humorous fugitive pamphlet, entitled, *An Essay for abridging the Study of Physic*; to which is added, *A Dialogue betwixt Hygeia, Mercury, and Pluto*; as also an Epistle from Utbek the Persian to Joshua Ward, Esq. In 1737 he published *A Synopsis of the History and Cure of Venereal Diseases*. This was soon followed by the *Economy of Love*, a poem which has much merit, but is too strongly tinged with the licentiousness of Ovid. His Art of preserving Health, which was published in 1744, is his best performance, and will transmit his name to posterity as one of the first English writers. In 1746 Dr. Armstrong was appointed one of the physicians to the hospital for lame and sick soldiers, behind Buckingham-house. In 1751 he published his poem *On Benevolence*; and in 1753, *Taste*, an Epistle to a young Critic. In 1760 he had the honour of being appointed physician to the army in Germany; where, in 1761, he wrote a poem called *Day*, an Epistle to John Wilkes, of Aylesbury, Esq. In this poem, which is not collected in his works, he wantonly hazarded a reflection on Churchill, which drew out him the serpent-toothed vengeance of that severest of satirists. In 1770 Dr. Armstrong published a collection of *Miscellanies* in two volumes; containing, 1. *The Art of preserving Health*. 2. *Of Benevolence*, an Epistle to Eumenes. 3. *Taste*, an Epistle to a young Critic, 1753. 4. *Imitations of Shakspeare and Spenser*. 5. *The Universal Almanac*, by Noureddin Ali. 6. *The Forced Marriage*, a Tragedy. 7. *Sketches*. In 1771 he published *A short Ramble through some Parts of France and Italy*, by Lancelot Temple; and in 1773, a quarto pamphlet, under the title of *Medical Essays*. He died in September 1770.

ARMSTRONG (Sir Thomas), descended of an ancient and loyal family, was born at Nimegen in Holland. As he grew up, he discovered a vigorous, martial disposition, which recommended him to the acquaintance and esteem of many persons of quality, who looked upon him as a man of a warm heart, and a good head. He was a very stirring and active royalist during the exile of King Charles II. which exposed him to the malice of the Protector, Cromwell, who caused him to be confined a year in Lambeth-house, which in those times was a prison. He suffered greatly in this imprisonment; for the royalists were at that time so exhausted, that, how warm-foever their charity might be in their hearts, its effects were but cold, and therefore Mr. Armstrong was very near sinking;

under this misfortune, when by some accident or other he recovered his liberty. This usage, hard and cruel as it was, could neither break his spirits, nor abate his loyalty, which induced the principal friends the king had in his dominions, to make choice of him to go to his majesty, then at Brussels, with bills of exchange of great value, and other papers of still greater importance, which commission he executed with such diligence and discretion, that he not only put the bills and papers safely into the king's hands, but brought home and delivered as safely the answers with which he was entrusted. But the Protector had so good intelligence, that within a week after he came back, he was seized and sent to the Gatchouse, where he suffered another sharp imprisonment, and was in great danger of losing his life. This service was so acceptable to the king when performed, that he conferred on him the honour of knighthood; and yet the remembrance of it was so far from being of any service to him in his troubles, that it was thought one principal reason for taking away his life. After this he was again imprisoned in the Tower, and obtained his liberty only by the death of the Protector, and on his obtaining it, returned to the service of his master, and was one of those distinguished royalists, that signed that excellent address to the Lord General Monk, that operated so strongly in favour of the Restoration. On the king's return he was taken into great favour, was employed in many services of importance, promoted to the rank of lieutenant in one of the troops of horse-guards, and was gentleman of horse to his majesty. The heat and vehemence of his temper betrayed him however into some excesses, and particularly into one, which was extremely fatal to his reputation, and, but for the king's favour, might have been fatal also to his life. This was the killing one Mr. Scroop in a play-house quarrel, which misfortune rendered it necessary, or at least expedient, for him to leave the kingdom, but he did it in an honourable way, and as an attendant upon the king's natural son, Mr. James Crofts, afterwards so well known to the world, by the title of Duke of Monmouth. He served with him in Flanders with great reputation, and there acquired such a degree of military skill, as made him be considered as an active and accomplished officer, which made him the more dear to those noblemen of a martial disposition who attached themselves to that duke. After the war was over he returned to England, and stood in all appearance in as high favour, and as great credit with the king, as ever. But this did not continue long; for the times growing troublesome, and factions arising both in the court and country, he had the misfortune to fall into such measures as disobliterated his master, drew upon him at first his coldness and displeasure, and ended at last in removing him from all his places, and in his total dismission from court. The long intercourse of friendship he had with, and his great dependence on, the Duke of Monmouth, proved the first cause of his troubles, and in the end that of his ruin. The court had no sooner received informations of a traitorous nature against Sir Thomas; than they took all imaginable pains to get him into their hands; but he having timely notice of the discoveries made against him, made his escape, and after some time spent, with as much secrecy as possible, in England, he withdrew into Holland, and passed by the name of Mr. Henry Lawrence, and there thought himself safe; but Mr. Chudleigh, King Charles's minister there, obtaining a warrant from the States, for apprehending such of the conspirators as had fled from England, he was seized at Leyden, and delivered up to the king's minister, who sent him to England. While this unfortunate gentleman was in Holland, an indictment was preferred against him in London, for high-treason, upon which he was outlawed, and upon his being brought home, it was resolved to proceed against him upon this outlawry, without allowing him the benefit of a trial. He was

accordingly committed to Newgate, and on the 20th of June, 1684, executed at Tyburn as a traitor.

ARNA, a town of Andros, an island of the Archipelago, with a good harbour.

ARNALD (Richard), was born at London, and admitted a pensioner of Benet College, Cambridge, in 1714. After taking the degree of B. A. being disappointed of a fellowship, he removed to Emanuel College, March 10, 1718, where he proceeded M. A. and was elected fellow in 1721. He commenced B. D. seven years after, as the statutes of that house required, and continued there till the society presented him to the rectory of Thurcaston in Leicestershire. Whilst fellow of that college, he printed two copies of Sapphics on the death of King George; a sermon preached at Bishop Stortford school-feast, August 3, 1726; and another at the archdeacon's visitation at Leicester, April 22, 1737. A third, preached at Thurcaston, October 9, 1746, was published under the title of The Parable of the Cedar and Thistle, exemplified in the great victory at Culloden, 4to. In 1744 he published his celebrated Commentary on Widdow, in folio; that on Ecclesiastics, in 1748; and another on Tobit, 8vo. in 1752. He married a daughter of Mr. Wood, rector of Wilford, near Nottingham, and died in 1756.

ARNALL (William), a noted political writer in defence of Sir Robert Walpole, was originally an attorney's clerk; but being recommended to Walpole, he employed him for a course of years in writing the *Free Briton* and other papers in defence of his administration. By the report of the secret committee, he appears to have received, in the space of four years, no less than 10,997l. 6s. 8d. out of the treasury for his writings! but spending his money as fast as it came, and his supplies stopping on Sir Robert's resignation, he died broken-hearted and in debt, in the 26th year of his age. His invention was so quick, that his honourable employer used to say, no man in England could write a pamphlet in so little time as Arnall.

ARNAUD DE MERVEILL, or MERVEIL, a poet of Provence, who lived at the beginning of the 13th century. He wrote a book entitled, *Las cecafenas de sa contesse*; and a collection of poems and sonnets. He died in the year 1220. Petrarch mentions him in his *Triumph of Love*.

ARNAUD DE VILLA NOVA, a famous physician, who lived about the end of the 13th and beginning of the 14th century. He studied at Paris and Montpellier, and travelled through Italy and Spain. He was well acquainted with languages, and particularly with the Greek, Hebrew, and Arabic. He was at great pains to gratify his ardent desire after knowledge; but this passion carried him rather too far in his researches: he endeavoured to discover future events by astrology, imagining this science to be infallible; and upon this foundation he published a prediction, that the world would come to an end in the middle of the 14th century. He practised physic at Paris for some time: but having advanced some new doctrines, he drew upon himself the resentment of the university; and his friends, fearing he might be arrested, persuaded him to retire from that city. Upon his leaving France, he retired to Sicily, where he was received by King Frederic of Arragon with the greatest marks of kindness and esteem. Some time afterwards, this prince sent him to France, to attend Pope Clement in an illness; and he was shipwrecked on the coast of Genoa, about the year 1313. The works of Arnaud, with his life prefixed, were printed in one volume, in folio, at Lyons, in 1520; and at Basil in 1585, with the notes of Nicholas Tolerus.

ARNAUD D'ANDILLY (Robert), the son of a celebrated advocate of the parliament of Paris, was born in 1588; and, being introduced young at court, was employed in many considerable offices, all which he discharged with great integrity and reputation. In 1644 he quitted business, and retired into

the convent of Port Royal des Champs, where he passed the remainder of his days in a continued application to works of piety and devotion; and enriched the French language with many excellent translations of different writers, as well as with religious compositions of his own. He died in 1674, and his works are printed in eight volumes folio.

ARNAUD (Anthony), brother of the preceding, and a doctor of the Sorbonne, was born in 1612. He published, in 1643, *A Treatise on frequent Communion*, which highly displeased the Jesuits; and the disputes upon grace, which broke out about this time in the university of Paris, and in which he took a zealous part with the Janenists, helped to increase the animosity between him and the Jesuits. But nothing raised so great a clamour against him, as the two letters he wrote on *Abolition*; in the second of which the faculty of divinity found two propositions which they condemned, and M. Arnaud was expelled the society. Upon this he retired; and during a retreat which lasted near 25 years, he composed that great variety of works which are extant of his, on grammar, geometry, logic, metaphysics, and theology. In 1679 he withdrew from France, living in obscurity in the Netherlands, and died in 1694. His heart, at his own request, was sent to be deposited in the Port Royal. Arnaud had a remarkable strength of genius, memory, and command of his pen, nor did these decay even to the last year of his life. Mr. Bayle says, he had been told by persons who had been admitted into his familiar conversation, that he was a man very simple in his manners; and that unless any one proposed some question to him, or desired some information, he said nothing that was beyond common conversation, or that might make one take him for a man of great abilities; but when he set himself to give an answer to such as proposed a point of learning, he seemed as it were transformed into another man: he would then deliver a multitude of fine things with great perspicuity and learning, and had a particular talent at making himself intelligible to persons of not the greatest penetration.

ARNDT (John), a famous protestant divine of Germany, born at Ballentitz in the duchy of Anhalt, in the year 1555. At first he applied himself to the study of physic; but falling into a dangerous sickness, he made a vow to change his profession for that of divinity, if he should be restored to health; which he accordingly did upon his recovery. He was minister first at Quedlinburg, and then at Brunswick. He met with great opposition in this last city: his success as a preacher raised the enmity of his brethren, who became his bitter enemies. In order to ruin his character, they ascribed a variety of errors to him; and persecuted him to such a degree, that he was obliged to leave Brunswick, and retire to Ilse, where he was minister for three years. In 1611, George duke of Lauenburg, who had a high opinion of his integrity and sanctity, gave him the church of Zell, and appointed him superintendent of all the churches in the duchy of Lauenburg; which office he discharged for 11 years, and died in 1621. It is reported that he foretold his death, having said to his wife, upon his return home after his last sermon, that now he had preached his funeral sermon. He wrote in High Dutch *A Treatise on true Christianity*, which has been translated into several languages.

ARNE (Dr. Thomas Augustine), distinguished by his great musical talents, was the son of Mr. Arne, an upholsterer in Covent-Garden, whom Addison is supposed to have characterized in No. 155, and No. 160, of *The Tatler*; and brother of Mrs. Cibber, the player. He was early devoted to music, and soon became eminent in his profession. July 6, 1759, he had the degree of doctor of music conferred on him at Oxford. His compositions are universally applauded, and he was especially skilful in instructing vocal performers.

Vol. X.

He died March 5, 1778, having written the following pieces: Artaxerxes, 1762; *The Guardian Outwitted*, 1764; *The Rife*, 1778; all of them operas, and in high esteem.

ARNEBERG, a town of Germany in Brandenburg, on the Elbe, between Angermund and Werben, three miles from each.

ARNEDO, a sea-port of Peru, 25 miles N. of Lima. ARNISÆUS (Henningus), a philosopher and physician of great reputation, about the beginning of the 17th century. He was born at Halberstadt in Germany, and was professor of physic in the university of Helmstadt. His political works are much esteemed. The most remarkable of them is his book *De autoritate principum in populum semper inviolabili*, printed at Frankfort in 1612. In this he maintains that the authority of princes ought not to be violated. He wrote also upon the same doctrine his three books *De jure majestatis*, printed at the same place in 1610; and his *Reflectiones politicae*, printed at Frankfort in 1615. Having received an invitation to go to Denmark, he went thither, and was made counsellor and physician to the king. He travelled into France and England, and died in November 1635. Besides the pieces already mentioned, he wrote several philosophical, medicinal, and political treatises.

ARNO, a large river in Tuscany. It has its source in the Apennines, and passing by Florence and Pisa, falls into the sea a little below the latter.

ARNOBIUS, professor of rhetoric at Sicca in Numidia, towards the end of the third century. It was owing to certain dreams which he had, that he became desirous of embracing Christianity. For this purpose he applied to the bishops to be admitted into the church. But they, remembering the violence with which he had always opposed the true faith, had some distrust of him; and, before they would admit him, insisted on some proofs of his sincerity. In compliance with this demand, he wrote against the Gentiles; wherein he has refuted the absurdities of their religion, and ridiculed their false gods. In this treatise he has employed all the flowers of rhetoric, and displayed great learning: but from an impatience to be admitted into the body of the faithful, he is thought to have been in too great a hurry in composing his work, and thence it is that there does not appear in this piece such an exact order and disposition as could be wished; and not having a perfect and exact knowledge of the Christian faith, he published some very dangerous errors. Mr. Bayle remarks, that his notions about the origin of the soul, and the cause of natural evil, and several other important points, are highly pernicious. St. Jerom, in his epistle to Paulinus, is of opinion that his style is unequal and too diffuse, and that his book is written without any method; but Dr. Cave thinks this judgment too severe, and that Arnobius wants neither elegance nor order in his composition. Vossius styles him *the Varro of the ecclesiastical writers*. Du Pin observes that his work is written in a manner worthy of a professor of rhetoric: the turn of his sentiments is very oratorical; but his style is a little African, his expressions being harsh and inelegant. We have several editions of this work of Arnobius against the Gentiles, one published at Rome in 1542, at Basil in 1546 and 1560, at Paris in 1570, at Antwerp in 1582, and one at Hamburg in 1610, with notes by Gebhard Elmenhorstius, besides many others. He wrote also a piece entitled, *De rhetorica institutione*; but this is not extant.

ARNOLD, of Brescia, in Italy, distinguished himself by being the founder of a sect, which opposed the wealth and power of the Romish clergy. He went into France, where he studied under the celebrated Peter Abelard. Upon his return to Italy, he put on the habit of a monk, and maintained in his sermons, That the pope and the clergy ought not to enjoy any

temporal estate; and that those ecclesiastics who had any estates of their own, or held any lands, were entirely cut off from the least hopes of salvation: that the clergy ought to subsist upon the alms and voluntary contributions of Christians; and that all other revenues belonged to princes and states, in order to be disposed of amongst the laity, as they thought proper. He maintained also several heresies with regard to baptism and the Lord's supper. St. Bernard has drawn his character in very strong colours. "Would to God (says he) that his doctrine was as holy as his life is strict: would you know what sort of man this is? Arnold of Brescia is a man that neither eats nor drinks; who, like the devil, is hungry and thirsty after the blood of souls; who goes to and fro upon the earth, and is always doing among strangers what he cannot do amongst his own countrymen; who ranges like a roaring lion, always seeking whom he may devour; an enemy to the cross of Christ, an author of discords, an inventor of schisms, and a disturber of the public peace: he is a man, whose conversation has nothing but sweetness, and his doctrine nothing but poison in it; a man who has the head of a dove, and the tail of a scorpion." He engaged a great number of persons in his party, who were distinguished by his name, and proved very formidable to the popes. His doctrines rendered him so obnoxious, that he was condemned in the year 1139, in a council of near 1000 prelates, held in the church of St. John Lateran at Rome, under Pope Innocent II. Upon this he left Italy, and retired to Switzerland. After the death of that pope, he returned to Italy, and went to Rome, where he raised a sedition against Pope Eugenius III. and afterwards against Hadrian IV. who laid the people of Rome under an interdict till they had banished Arnold and his followers. This had its desired effect: the Romans seized upon the houses which the Arnolds had fortified, and obliged them to retire to Otricoli in Tuscany; where they were received with the utmost affection by the people, who considered Arnold as a prophet. However, he was seized some time after by Cardinal Gerard; and, notwithstanding the efforts of the viscounts of Campanio, who had rescued him, he was carried to Rome, and condemned by Peter, the prefect of that city, to be hanged, and was accordingly executed in the year 1155. Thirty of his followers went from France to England, about the year 1160, in order to propagate their doctrine there; but they were immediately seized and destroyed.

ARNOLDUS (Gothofredus), pastor and inspector of the churches of Perleberg, and historiographer to the King of Prussia, was born at Annaburg in the mountains of Misnia, in 1666. He was a zealous defender of Pietists, a sect among the German Protestants, and composed a great number of religious works; particularly an *Ecclesiastical History*, which exposed him to the resentment of the divines; and another giving an account of the doctrines and manners from the first ages, in which he frequently animadverts upon Cave's primitive Christianity. He died in 1714. Various are the opinions concerning Arnoldus in Germany; some of his own countrymen and profession extolling him to the skies as a saint of the last century, and setting an inestimable value upon his works; while others pronounce damnation upon him as an arch-heretic, and condemn his writings as heterodox.

ARNSHEIM, a town of Germany, in the palatinate of the Rhine, eight miles from Crutzenach.

ARNULPH, or ERNULPH, bishop of Rochester in the reign of Henry I. He was born in France, where he was some time a monk of St. Lucian de Beauvais. The monks led most irregular lives in this monastery; for which reason he resolved to quit it, but first took the advice of Lanfranc archbishop of Canterbury, under whom he had studied in the abbey of Bec, when Lanfranc was prior of that monastery.

This prelate invited him over to England, and placed him in the monastery of Canterbury, where he lived a private monk till Lanfranc's death. When Anselm came to the archiepiscopal see, Arnulph was made prior of the monastery of Canterbury, and afterwards abbot of Peterborough. In 1115 he was consecrated bishop of Rochester, which see he held nine years; and died in March 1124, aged 84.

ARNULPH wrote, 1. A piece in Latin concerning the foundation, endowment, charters, laws, and other things relating to the church of Rochester: it is generally known by the title of *Textus Roffensis*, and is preserved in the archives of the cathedral church of Rochester. 2. An Epistle in Answer to some Questions of Lambert, Abbot of Munster; and, 3. An Epistle on Incestuous Marriage.

ARNWAY (John), a clergyman distinguished by his benevolence and loyalty to King Charles I. was descended from a very good family in the county of Salop, from which he inherited a considerable estate. He was educated at Oxford; and, having received holy orders, obtained the rectories of Hodnet and Lightfield, where he distinguished himself by his piety and exemplary charity: for it was his custom to clothe annually 12 poor people, and every Sunday to entertain as many at his table, not only plentifully, but with intimacy and respect. The civil war breaking out, he preached against rebellion and raised and clothed eight troopers for the service of King Charles I. upon which his house was plundered by the parliament's army. He then went to Oxford to serve the king in person, which subjected him to a new train of misfortunes: for his estate was soon after sequestered, and himself imprisoned till the king's death; after which, he went to the Hague, where he published, 1. The Tablet, or the Moderation of Charles I. the Martyr; and, 2. An Alarm to the Subjects of England. He at last went to Virginia, where he died in 1653.

AROBÆ (*Encycl.*). The word AROBAS, referred to in that article should have been spelled ARROBAS.

AROMATA, a town of Lydia, famous for its generous wines; and hence the appellation (Strabo). Also the name of a trading town and promontory of Ethiopia, at the termination of the Sinus Aivalites of the Red Sea (Arrian).

ARPINAS, or ARPINO (Joseph Caesar), a famous painter, born in the year 1560, at the castle of Arpinas, in the kingdom of Naples. He lived in great intimacy with Pope Clement VIII. who conferred upon him the honour of knighthood, and bestowed on him many other marks of his friendship. In the year 1600 he went to Paris with Cardinal Aldobrandini, who was sent legate to the French court on the marriage of Henry IV. with Mary of Medicis. His Christian majesty gave Arpinas many considerable presents, and created him a knight of St. Michael. The colouring of this painter is thought to be cold and inanimate; yet there is spirit in his designs, and his compositions have somewhat of fire and elevation. The touches of his pencil being free and bold, give therefore pleasure to connoisseurs in painting; but they are generally incorrect. What he painted of the Roman history is the most esteemed of all his works. The French king has in his collection the following pieces of this master; viz. the nativity of our Saviour, Diana and Acteon, the rape of Europa, and a Sufanna. He died at Rome in 1640.

ARPINUM, a town of the Volsci, a little to the east of the confluence of the rivers Liris and Fibrenus, in the Terra di Lavoro; now decayed, and called *Arpino*. It was the native place of Cicero, and of C. Marius (Sallust).

ARRAN, a town of Switzerland, on the Aar, 25 miles S. W. of Baden.

ARRETUM (Cicero, Caesar); *Arrhetium* (Ptolemy); *Urbs Arrhetinorum* (Polybius); one of the twelve ancient towns of Tuscany, near the Arnum and Clanis, situated in 2

pleasant valley. Now *Arezzo*, 42 miles east of Florence. E. long. 13. 18. Lat. 43. 15.

ARRIAN, a famous philosopher and historian under the Emperor Hadrian and the two Antonines, was born at Nicomedia in Bithynia. His great learning and eloquence procured him the title of *The second Xenophon*; and raised him to the most considerable dignities at Rome, even the consulship itself. We have four books of his *Dissertations upon Epictetus*, whose scholar he had been; and his *History of Alexander the Great*, in seven books, is greatly admired by the best judges.

ARRIEGE, a department of France, containing the late provinces of Couserans and Foix. It is so named from a river which rises in the Pyrenæes, and passing by Foix and Pamiers, falls into the Garonne, near Toulouse. Gold dust is found among its sands.

ARSAMAS, a town of the Russian empire, seated on the river Mokka-reca, on the road to Astracan, 300 miles S. by E. of Moscow, and 500 N. by W. of Astracan.

ARSENATES, in the new chemistry, are combinations of arsenic with metallic substances. In the Phil. Trans. Part I. for 1801, we find a description of the arseniates of copper, and of iron, from the county of Cornwall, by the Count de Bournon.

This paper is divided into two sections: the first of which contains an account of the *arseniates of copper*, the natural combination of the arsenic acid with copper; and the different aspects under which this combination appears, according to the proportions in which these two substances are united, Count de Bournon observes, were among those objects of mineralogy, respecting which our imperfect knowledge required the aid of study and observation. A new copper mine, lately worked, called Huel Gorland, in the parish of Gwennap, in the county of Cornwall, having, within the last two years, enriched the cabinets of London with some very fine specimens of these arseniates, he was induced to pay particular attention to them; and in this paper he gives a very accurate description of the different species of these ores. He says,

"It is now above twenty years since arseniate of copper was discovered in the county of Cornwall; it was first found either in Carrarach mine, in the parish of Gwennap, or in Tincroft mine, in the parish of Allogan. Its matrix, like that of almost all the copper ores of this country, was siliceous, and consisted of a decomposed granite, of which the greatest part of the feldspar had passed into the state known by the name of kaolin. It was accompanied with grey vitreous copper-ore, frequently in considerable masses: also with much black oxyd of copper; and with various oxyds of iron.

"The arseniate here spoken of, which had never been found in large quantity, had ceased to exist in the above-mentioned mines, when Huel Gorland mine, lately wrought, began to enrich mineralogy with this uncommon substance. The matrix of this is likewise siliceous; sometimes crystalline; and sometimes in an amorphous mass. Here and there we find mixed with it, in greater or less profusion, all the known oxyds of copper; many of the argillaceous oxyds of iron; also grey vitreous copper ore; arsenical pyrites; and the rich deep-coloured yellow copper ore."

The existence of arseniate of copper seems, even at this day, to be an object of doubt among the French mineralogists: for "the Abbé Haüy does not mention it in the 28th and following numbers of the *Journal des Mines*, although they contain an interesting extract of a system of mineralogy, which he was then preparing for the press; nor has M. Fourcroy even hinted at it, in his *Système des Connoissances Chimiques*, lately published."

Nature appears to have established very remarkable dif-

ferences between the arseniates of copper; and these take place not only in their forms, but likewise in their hardness and specific gravity. These differences arise, either from the manner in which the arsenic acid is combined with the copper, or from the different proportions in which these two substances are combined."

The Count follows the same order, and divides the arseniates of copper into four different species; and the very interesting analysis of this substance, made by Mr. Chevenix, has, he observes, afforded the most satisfactory sanction to this division.

The first species is, arseniate of copper in the form of an obtuse octaedron—2d, in hexaedral laminae, with inclined sides—3d, in the form of an acute octaedron: of this species, he describes five varieties—4th, in the form of a triedral prism.

The second section contains an account of the *arseniates of iron*.

"Muttrell mine," our author observes, "which is immediately contiguous to Huel Gorland mine, in the county of Cornwall, has produced some specimens of arseniates of copper, exactly similar to those described in the former part of this paper. But this mine is still more interesting to mineralogists, on account of a combination found therein, of arsenic acid with iron, and also a double combination of that acid with both iron and copper.

"The first mentioned of these arseniates seems analogous to those crystals, or cubes, of a fine green colour, of which some specimens had already been found in Carrarach and Tincroft mines; and which Klaproth, in his Memoir upon the Mineralogy of Cornwall, considered as belonging to the arseniates of copper; but, according to the analysis made by Mr. Chevenix, with all the care which his extensive knowledge and extreme zeal for science would naturally lead him to employ; it appears to be a true arseniate of iron, containing only a small quantity of copper; and even that quantity seems to be merely an accidental mixture. As, in the specimens from the old mines of Tincroft and Carrarach, the greatest part of the crystals adhered to vitreous grey copper ore, it is possible that some particles of that ore remained attached to the crystals; or, as I have frequently found to be the case, that some such particles had penetrated into the crystals, and that Mr. Klaproth had been thereby deceived, by finding in the button left by the blow-pipe, a much greater proportion of copper than this ore really contains. The natural decomposition of this arseniate, which produces an oxyd of iron of a fine reddish yellow colour, strongly confirms the result of Mr. Chevenix's analysis.

"The double combination of the arsenic acid with iron and copper, although it had appeared to exist in the arseniate just spoken of, in the mines of Tincroft and Carrarach, had not excited the attention of mineralogists. It is however possible, that the transparency, the brilliancy, and the pale blue colour of its crystals, might occasion them to be mistaken for crystals of a stony nature. Besides, their smallness might easily cause them to escape the notice of common observation, particularly when they are not in pretty large groups."

The matrix of these arseniates appears, from our author's description, to be exactly the same as that of the arseniates of copper; "consisting, like that, of quartz, mixed with yellow, grey, and vitreous ores of copper, with oxyds of iron, and with mispickel. The mines of Huel Gorland and Muttrell, although not situated in the district of the tin mines, have yet produced some specimens of tin, the crystals of which are covered with those of the arseniate here spoken of. Two specimens of this kind are in the collection of Sir John St. Aubyn."

Of these arseniates, the count describes two species: 1st,

Simple arseniate of iron, which crystallizes in perfect cubes, and, cupreous arseniate of iron. The crystals of this species are of uncommon brilliancy, and perfectly transparent. Their form is a rhomboidal tetraedral prism, having two of its edges very obtuse, and the other two very acute.

Our limits do not permit us to present our readers with the descriptions of this very accurate mineralogist, but we refer them to the work itself: the paper is accompanied by two plates, containing delineations of the figures of the crystals of the different species.

The next article in the volume contains the "Analysis of the Arseniates of Copper, and of Iron, described in the preceding Paper; likewise an Analysis of the red octaedral Copper Ore of Cornwall; with Remarks on some particular modes of Analysis, by Richard Chenevix, Esq. M. R. I. A."

Mr. Chenevix writes thus, "when the Count de Bournon had completed what appeared to him the mineralogical classification of these copper ores, he gave me some specimens of each kind, numbered indiscriminately, for the very purpose of excluding prejudice; and it was not till my task was ended, that we compared our observations. If I had been admitted into any previous knowledge of the arrangement dictated to him by the principles of crystallography, I should have been afraid, that I had merely thought true, what I wished to be so. But I can, most conscientiously, indulge in the satisfaction which the according results of different means to prove the same proposition naturally excite; and which is justly due to the truth of the outward marks, however delicate, yet still to be perceived, that Nature has left visible to those who will observe her."

The following are the general results of this analysis.

The first species described by the Count de Bournon in the preceding paper, according to Mr. Chenevix, contains 49 parts of oxyd of copper, 14 of arsenic acid, and 35 of water. The second species contains 58 of oxyd of copper, 21 of arsenic acid, and the same quantity of water. The third species was found to contain 60 parts of oxyd of copper, and 39.7 of arsenic acid. In the fourth were found 54 parts of oxyd of copper, 30 of arsenic acid, and 16 of water.

After having expelled the water of crystallization by exposure to a proper degree of heat in a platina crucible, the residuum was dissolved in diluted nitric acid, and nitrat of lead poured in. Arseniate of lead and nitrat of copper were thus formed, by double decomposition. To separate these two salts, alcohol was added, on which the arseniate of lead fell to the bottom, while the nitrat of copper was held in solution. From the arseniate of lead procured by filtration, it was easy to calculate the quantity of arsenic acid which the ore contained; and the spirituous solution being distilled, from the nitrat of copper remaining, the quantity of that metal was obtained, by boiling the solution with potash or soda.

Mr. Chenevix next proceeds to the examination of the arseniates of iron, which were formerly included among the arseniates of copper, but which are now separated from them upon the authority of chemical analysis. Our author very properly observes, that "although to recognize, by external character and form, in all their modifications, substances already known, is particularly the province of crystallography; yet he, who would expect that it should declare the nature of those substances which it beholds for the first time, would exact more than it ever has promised, or ever could perform. Among fossils, it may class, and find new species; but chemical analysis is the basis of all arrangement, among metallic ores. In them, to separate, is the task of the one; to assign a place, is the business of the other."

The cupreous arseniate of iron was found to be composed of

3 parts of silica, 33.5 of arsenic acid, 27.5 of oxyd of iron, 22.5 of oxyd of copper, and 12 of water.

The simple arseniate of iron is found to contain 4 parts of silica, 31 of arsenic acid, 45.5 of oxyd of iron, 9 of oxyd of copper, and 13.5 of water. This ore, our author observes, appears to be a pure arseniate, mixed accidentally with a little copper, as some of the cupreous arseniates casually give traces of iron.

The third section of this ingenious and elaborate essay, contains an "Analysis of the red octaedral Copper Ore, in which the Metal exists in a State hitherto unknown in Nature."

In the course of the experiments which have been stated in the preceding sections, the author observes, that he had occasion to examine a great number of copper ores, particularly those from Cornwall; but the only ore which afforded any interesting results, was the well-known species called red copper ore, crystallized in regular and brilliant octaedrons. This ore has been so long known, and so often mentioned by mineralogists, that it may excite our surprize when we reflect that its chemical nature has not been accurately ascertained before; and that mineralogists differ so very much in their accounts of it.

"Romé de Lile, the Baron de Born, Lametherie, the Abbé Hany, and indeed every other mineralogist, concur in calling this substance red calx of copper; but some of them assert, that it contains a portion of carbonic acid. Among the many analyses which have been made of this ore, by Fontana, Monnet, de Born, Renovant, and others, I could not find one, that in the proportions, or even in the ingredients, resembled what I had found to be its contents. The highest amount of copper (that given by Fontana), does not exceed 66 per cent. and is far short of the real quantity. The remainder, as he states, consists of water, and of pure and fixed airs."

The difference in the results which our author obtained together with some new facts he had occasion to observe during his experiments, induced him, he says, to consider the subject at some length; he particularly describes his experiments, which presented a number of curious and some unexpected results, and states the component parts of this ore to be 88.5 of copper, and 11.5 of oxygen; so that this ore is a suboxyd of copper; a state in which it has not before been supposed to exist in nature.

Mr. Chenevix observes, that when "we reflect, not so much on the quantity as upon the extreme purity of the copper, and the wonderful facility with which this useful metal may be extracted, it will be found much superior to every copper ore hitherto discovered. It would be well worth the attention of miners to keep a constant look-out for this substance, which, I am informed, is not rare in Cornwall. It contains no iron, and no sulphur; the absence of which latter is a peculiar advantage. It is a fact not generally known, I believe, that there is hardly such a thing in commerce, as copper which does not contain a little sulphur; at least I have rarely met with any such; and it requires but a very minute portion of sulphur, to increase the fusibility of copper. The advantage of obtaining copper free from sulphur, is too obvious to require to be pointed out; and that advantage does this ore possess."

Besides an account of the experiments for the purposes of analysis, this paper contains a number of ingenious observations and disquisitions, and some valuable remarks on the methods generally used in the doctrinastic art, which we have not room to transcribe, and they are incapable of abridgment. We shall conclude our account with a quotation, which we have little doubt will afford as great pleasure to the reader.

"But, what is not the least to be admired, is the wonderful accordance in the order which two sciences, operating with very different instruments, have allotted to be the same substances.

By that, not only the sagacity of nature becomes very striking; but, from the acknowledged accuracy of one method of investigation, the reliance to be placed upon the other is rendered more conspicuous; and each receives additional strength and confirmation. Chemistry has long been in the habit of aiding the science of mineralogy, of which it laid the foundation; but it was not till lately, that crystallography could form a judgment of its own; much less confirm the truth of the source from which it sprung."

ARSENIOUS, a deacon of the Roman church, of great learning and piety. He was pitched upon by the pope to go to the Emperor Theodosius, as tutor to his son Arcadius. Arsenius arrived at Constantinople in the year 383. The emperor happening one day to go into the room where Arsenius was instructing Arcadius, his son was seated and the preceptor standing; at this he was exceedingly displeased, took from his son the imperial ornaments, made Arsenius sit in his place, and ordered Arcadius for the future to receive his lessons standing uncovered. Arcadius, however, profited but little by his tutor's instructions, for some time after he formed a design of dispatching him. The officer, to whom Arcadius had applied for this purpose, divulged the affair to Arsenius, who retired to the deserts of Scete, where he passed many years in the exercises of the most strict and fervent devotion. He died there, at ninety-five years of age.

ARTS, *Progress of the (Encycl.)*. In all countries where the people are barbarous and illiterate, the progress of arts is extremely slow. It is vouched by an old French poem, that the virtues of the loadstone were known in France before anno 1180. The mariner's compass was exhibited at Venice anno 1260, by Paulus Venetus, as his own invention. John Goya of Amalfi was the first who, many years afterward, used it in navigation; and also passed for being the inventor. Though it was used in China for navigation long before it was known in Europe, yet to this day it is not so perfect as in Europe. Instead of suspending it in order to make it act freely, it is placed upon a bed of sand, by which every motion of the ship disturbs its operation. Hand-mills, termed *querns*, were early used for grinding corn; and when corn came to be raised in greater quantity, horse-mills succeeded. Water-mills for grinding corn are described by Vitruvius. Wind-mills were known in Greece and in Arabia as early as the seventh century; and yet no mention is made of them in Italy till the fourteenth. That they were not known in England in the reign of Henry VIII. appears from a household book of an earl of Northumberland, contemporary with that king, stating an allowance for three mill-horses, "two to draw in the mill, and one to carry stuff to the mill and fro." Water-mills for corn must in England have been of a later date. The ancients had mirror-glasses, and employed glass to imitate crystal vases and goblets: yet they never thought of using it in windows. In the 13th century, the Venetians were the only people who had the art of making crystal glass for mirrors. A clock that strikes the hours was unknown in Europe till the end of the 12th century. And hence the custom of employing men to proclaim the hours during night; which to this day continues in Germany, Flanders, and England. Galileo was the first who conceived an idea that a pendulum might be useful for measuring time; and Huygens was the first who put the idea in execution, by making a pendulum clock. Hook, in the year 1660, invented a spiral spring for a watch, though a watch was far from being a new invention. Paper was made no earlier than the 14th century; and the invention of printing was a century later. Silk manufactures were long established in Greece before silk-worms were introduced there. The manufacturers were provided with raw silk from Persia: but that commerce being frequently interrupted by war, two

monks, in the reign of Justinian, brought eggs of the silk-worm from Hindostan, and taught their countrymen the method of managing them.—The art of reading made a very slow progress. To encourage that art in England, the capital punishment for murder was remitted if the criminal could but read, high in law-language is termed *benefit of clergy*. On would imagine that the art must have made a very rapid progress when so greatly favoured: but there is a signal proof of the contrary; for so small an edition of the Bible as 600 copies, translated into English in the reign of Henry VIII. was not wholly sold off in three years. The people of England must have been profoundly ignorant in Queen Elizabeth's time, when a forged clause added to the 20th article of the English creed passed unnoticed till about forty years ago.

The discoveries of the Portuguese on the west coast of Africa is a remarkable instance of the slow progress of arts. In the beginning of the 15th century, they were totally ignorant of that coast beyond Cape Non, 28 deg. north latitude. In 1410 the celebrated Prince Henry of Portugal fitted out a fleet for discoveries, which proceeded along the coast to Cape Bojadore in 26 deg. but had not courage to double it. In 1418 Tristram Vaz discovered the island Porto Santo; and the year after, the island Madeira was discovered. In 1439 a Portuguese captain doubled Cape Bojadore; and the next year the Portuguese reached Cape Blanco, lat. 20. deg. In 1446 Nuna Tristram doubled Cape Verd, lat. 14. 40. In 1448 Don Gonzalvo Vallo took possession of the Azores. In 1449 the islands of Cape Verd were discovered for Don Henry. In 1471 Pedro d'Elcavar discovered the island St. Thomas and Prince's island. In 1484 Diego Cam discovered the kingdom of Congo. In 1486 Bartholomew Diaz, employed by John II. of Portugal, doubled the Cape of Good Hope, which he called *Capo Tormentoso*, from the tempestuous weather he found in the passage.

The exertion of national spirit upon any particular art, promotes activity to prosecute other arts. The Romans, by constant study, came to excel in the art of war, which led them naturally to improve upon other arts. Having, in the progress of society, acquired some degree of taste and polish, a talent for writing broke forth. Nevius composed in verse seven books of the Punic war; besides comedies, replete with bitter raillery against the nobility. Ennius wrote annals, and an epic poem. Lucius Andronicus was the father of dramatic poetry in Rome. Pacuvius wrote tragedies. Plautus and Terence wrote comedies. Lucilius composed satires, which Cicero esteems to be slight and void of erudition. Fabius Pictor, Cincius Alimentus, Piso Frugi, Valerius Antias, and Cato, were rather annalists than historians, confining themselves to naked facts, ranged in order of time. The genius of the Romans for the fine arts was much inflamed by Greek learning, when free intercourse between the two nations was opened. Many of those who made the greatest figure in the Roman state commenced authors; Cæsar, Cicero, &c.: Sylla composed memoirs of his own transactions, a work much esteemed even in the days of Plutarch.

The progress of art seldom fails to be rapid, when a people happen to be roused out of a torpid state by some fortunate change of circumstances: prosperity contrasted with former abasement, gives to the mind a spring, which is vigorously exerted in every new pursuit. The Athenians made but a mean figure under the tyranny of Pisistratus; but upon regaining freedom and independence, they were converted into heroes. Miletus, a Greek city of Ionia, being destroyed by the King of Persia, and the inhabitants made slaves, the Athenians, deeply affected with the misery of their brethren, boldly attacked the king in his own dominions, and burnt the city of Sardis. In less than ten years after, they gained a

signal victory at Marathon; and, under Themistocles, made head against that prodigious army with which Xerxes threatened utter ruin to Greece. Such prosperity produced its usual effect: arts flourished with arms, and Athens became the chief theatre for sciences as well as for fine arts. The reign of Augustus Cæsar, which put an end to the rancour of civil war, and restored peace to Rome with the comforts of society, proved an auspicious era for literature; and produced a cloud of Latin historians, poets, and philosophers, to whom the moderns are indebted for their taste and talents. One who makes a figure rouses emulation in all: one catches fire from another, and the national spirit is every-where triumphant: classical works are composed, and useful discoveries made in every art and science. With regard to Rome, it is true, that the Roman government under Augustus was in effect despotic: but despotism, in that single instance, made no obstruction to literature, it having been the policy of that reign to hide power as much as possible. A similar revolution happened in Tuscany about three centuries ago. That country having been divided into a number of small republics, the people, excited by mutual hatred between small nations in close neighbourhood, became ferocious and bloody, flaming with revenge for the slightest offence. These republics being united under the Great Duke of Tuscany, enjoyed the sweets of peace in a mild government. That comfortable revolution, which made the deeper impression by a retrospect to recent calamities, roused the national spirit, and produced ardent application to arts and literature. The restoration of the royal family in England, which put an end to a cruel and envenomed civil war, promoted improvements of every kind: arts and industry made a rapid progress among the people, though left to themselves by a weak and fluctuating administration. Had the nation, upon that favourable turn of fortune, been blessed with a succession of able and virtuous princes, to what a height might not arts and sciences have been carried! In Scotland, a favourable period for improvement was the reign of the first Robert, after shaking off the English yoke: but the domineering spirit of the feudal system rendered abortive every attempt. The restoration of the royal family, mentioned above, animated the legislature of Scotland to promote manufactures of various kinds: but in vain; for the union of the two crowns had introduced despotism into Scotland, which sunk the genius of the people, and rendered them heartless and indolent. Liberty, indeed, and many other advantages, were procured to them by the union of the two kingdoms; but the salutary effects were long suspended by mutual enmity, such as commonly subsists between neighbouring nations. Enmity wore out gradually, and the eyes of the Scots were opened to the advantages of their present condition; the national spirit was roused to emulate and to excel; talents were exerted, hitherto latent; and Scotland at present makes a figure in arts and sciences, above what it ever made while an independent kingdom.

Another cause of activity and animation, is the being engaged in some important action of doubtful event; a struggle for liberty, the resisting a potent invader, or the like. Greece, divided into small states, frequently at war with each other, advanced literature and the fine arts to unrivalled perfection. The Corsicans, while engaged in a perilous war for defence of their liberties, exerted a vigorous national spirit: they founded an university for arts and sciences, a public library, and a public bank. After a long stupor during the dark ages of Christianity, arts and literature revived among the turbulent states of Italy. The Royal Society in London, and the Academy of Sciences in Paris, were both of them instituted after civil wars that had animated the people and roused their activity.

As the progress of arts and sciences toward perfection is greatly promoted by emulation, nothing is more fatal to an

art or science than to remove that spur, as where some extraordinary genius appears who fears above rivalry. Mathematics seem to be declining in Britain: the great Newton, having surpassed all the ancients, has not left to the moderns even the faintest hope of equalling him; and what man will enter the lists who despairs of victory?

In a country thinly peopled, where even necessary arts want hands, it is common to see one person exercising more arts than one: in several parts of Scotland, one man serves as a physician, surgeon, and apothecary. In every populous country, even simple arts are split into parts, and each part has an artist appropriated to it. In the large towns of ancient Egypt, a physician was confined to a single disease. In mechanic arts that method is excellent. As a hand confined to a single operation becomes both expert and expeditious, a mechanic art is perfected by having its different operations distributed among the greatest number of hands: many hands are employed in making a watch; and a still greater number in manufacturing a web of woollen cloth. Various arts or operations carried on by the same man, enervate his mind, because they exercise different faculties; and as he cannot be equally expert in every art or operation, he is frequently reduced to supply want of skill by thought and invention. Constant application, on the contrary, to a single operation, confines the mind to a single object, and excludes all thought and invention: in such a train of life, the operator becomes dull and stupid, like a beast of burden. The difference is visible in the manners of the people: in a country, where, from want of hands, several occupations must be carried on by the same person, the people are knowing and conversable; in a populous country, where manufactures flourish, they are ignorant and uncivilized. The same effect is equally visible in countries where an art or manufacture is confined to a certain class of men. It is visible in India, where the people are divided into castes, which never mix even by marriage, and where every man follows his father's trade. The Dutch linboers are a similar instance: the same families carry on the trade from generation to generation; and are accordingly ignorant and brutish even beyond other Dutch peasants. The inhabitants of Buckhaven, a sea-port in the county of Fife, were originally a colony of foreigners, invited hither to teach our people the art of fishing. They continue fishers to this day, marry among themselves, have little intercourse with their neighbours, and are dull and stupid to a proverb.

Useful arts paved the way to fine arts. Men upon whom the former had bestowed every convenience, turned their thoughts to the latter. Beauty was studied in objects of sight; and men of taste attached themselves to the fine arts, which multiplied their enjoyments and improved their benevolence. Sculpture and painting made an early figure in Greece; which afforded plenty of beautiful originals to be copied in these imitative arts. Statuary, a more simple imitation than painting, was sooner brought to perfection: the statue of Jupiter by Phidias, and of Juno by Polyceles, though the admiration of all the world, were executed long before the art of light and shade was known. Apollodorus, and Zeuxis his disciple, who flourished in the 15th Olympiad, were the first who figured in that art. Another cause concurred to advance statuary before painting, in Greece, viz. a great demand for statues of their gods. Architecture, as a fine art, made a slower progress: Proportions, upon which its elegance chiefly depends, cannot be accurately ascertained, but by an infinity of trials in great buildings: a model cannot be relied on; for a large and a small building, even of the same form, require different proportions.

From the fine arts mentioned, we proceed to literature. It is agreed, among all antiquaries, that the first writings were

in verse, and that writing in prose was of a much later date. The first Greek who wrote in prose was Phereclides Syrus: the first Roman was Appian Cæcilius, who composed a declamation against Pyrrhus. The four books of the Chatah Bhade, which is the sacred book of Hindostan, are composed in verse stanzas; and the Arabian compositions in prose followed long after those in verse. To account for that singular fact, many learned pens have been employed; but without success. By some it has been urged, that as memory is the only record of events where writing is unknown, history originally was composed in verse, for the sake of memory. This is not satisfactory. To undertake the painful task of composing in verse, merely for the sake of memory, would require more fore-thought than ever was exerted by a Barbarian: not to mention that other means were used for preserving the memory of remarkable events; a heap of stones, a pillar, or other object that catches the eye. The account given by Longinus is more ingenious. In a fragment of his treatise on verse, the only part that remains, he observes, "that measure or verse belongs to poetry, because poetry represents the various passions with their language; for which reason the ancients, in their ordinary discourse, delivered their thoughts in verse rather than in prose." Longinus thought, that anciently men were more exposed to accidents and dangers, than when they were protected by good government, and by fortified cities. But he seems not to have adverted, that fear and grief, inspired by dangers and misfortunes, are better suited to humble prose than to elevated verse. It may be added, that however natural poetical diction may be when one is animated with any vivid passion, it is not supposable that the ancients never wrote nor spoke but when excited by passion. Their history, their laws, their covenants, were certainly not composed in that tone of mind.

An important article in the progress of the fine arts, which writers have not sufficiently attended to, will, perhaps, explain this mystery. The article is the profession of a bard, which sprung up in early times, before writing was known (see the article WRITING); and died away gradually as writing turned more and more common (see BARD).

The songs of the bards, being universal favourites, were certainly the first compositions that writing was employed upon: they would be carefully collected by the most skillful writers, in order to preserve them in perpetual remembrance. The following part of the progress is obvious. People acquainted with no written compositions, but what were in verse, composed in verse their laws, their religious ceremonies, and every memorable transaction that was intended to be preserved in memory by writing. But when subjects of writing multiplied, and became more and more involved; when people began to reason, to teach, and to harangue; they were obliged to descend to humble prose; for to confine a writer or speaker to verse in handling subjects of that nature, would be a burden unsupportable.

The prose compositions of early historians are all of them dramatic. A writer destitute of art is naturally prompted to relate facts as he saw them performed: he introduces his personages as speaking and conferring; and he himself relates what was acted, and not spoke. The historical books of the Old Testament are composed in that mode; and so addicted to the dramatic are the authors of those books, that they frequently introduce God himself into the dialogue. At the same time, the simplicity of that mode is happily suited to the poverty of every language in its early periods. The dramatic mode has a delicious effect in expressing sentiment, and every thing that is simple and tender. Read, as an instance of a low incident becoming, by that means, not a little interesting, Ruthi. 8. to iv. 16.

The dramatic mode is far from pleasing so much in relating bare historical facts. Read, as an example, the story of Adonijah in 1 Kings i. 11—49.

In that passage there are frequent repetitions; not however by the same person, but by different persons who have occasion in the course of the story to say the same things; which is natural in the dramatic mode, where things are represented precisely as they were transacted. In that view, Homer's repetitions are a beauty, not a blemish; for they are confined to the dramatic part, and never occur in the narrative.

But the dramatic mode of composition, however pleasing, is tedious and intolerable in a long history. In the progress of society new appetites and new passions arise; men come to be involved with each other in various connections; incidents and events multiply, and history becomes intricate by an endless variety of circumstances. Dialogue accordingly is more sparingly used, and in history plain narration is mixed with it. Narration is as it were the ground-work; and dialogue is raised upon it, like flowers in embroidery. Homer is admitted by all to be the great master in that mode of composition.

The narrative mode came in time so to prevail, that in a long chain of history, the writer commonly leaves off dialogue altogether. Early writers of that kind appear to have very little judgment in distinguishing capital facts from minute circumstances, such as can be supplied by the reader without being mentioned. The history of the Trojan war by Dares Phrygius is a curious instance of that cold and creeping manner of composition. The Roman histories before the time of Cicero are chronicles merely. Cato, Fabius Pictor, and Piso, confined themselves to naked facts. In the Augustæ Historiæ Scriptores we find nothing but a jejune narrative of facts, commonly of very little moment, concerning a degenerate people, without a single incident that can rouse the imagination or exercise the judgment. The Monkish histories are all of them composed in the same manner.

The dry narrative manner being very little interesting or agreeable, a taste for embellishment prompted some writers to be copious and verbose. Saxo-Grammaticus, who in the 12th century composed in Latin a history of Denmark, surprisingly pure at that early period, is extremely verbose and full of tautologies. Such a style, at any rate unpleasant, is intolerable in a modern tongue, before it is enriched with a flock of phrases for expressing aptly the great variety of incidents that enter into history.

The perfection of historical composition, which writers at last attain to after wanderings through various imperfect modes, is a relation of interesting facts, connected with their motives and consequences. An history of that kind is truly a chain of causes and effects.

The history of Thucydides, and still more that of Tacitus, are shining instances of that mode.

Eloquence was of a later date than the art of literary composition; for till the latter was improved, there were no models for studying the former. Cicero's oration for Roiceus is composed in a style diffuse and highly ornamented; which, says Plutarch, was universally approved, because at that time the style in Asia, introduced into Rome with its luxury, was in high vogue. But Cicero, in a journey to Greece, where he leisurely studied Greek authors, was taught to prune off superfluities, and to purify his style, which he did to a high degree of refinement. He introduced into his native tongue a sweetness, a grace, a majesty, that surprised the world, and even the Romans themselves. Cicero observes with great regret, that if ambition for power had not drawn Julius Cæsar from the bar to command legions, he would have become the most complete orator in the world. So partial are men to the profession in which they excel. Eloquence triumphing at

popular assembly, makes some figure in a court of law composed of many judges, very little where there is but a single judge, and none at all in a despotic government. Eloquence flourished in the republics of Athens and Rome; and makes some figure at present in a British House of Commons.

The Greek stage has been justly admired among all polite nations. The *tragedies* of Sophocles and Euripides in particular are by all critics held to be perfect in their kind, excellent models for imitation, but far above rivalry. If the Greek stage was so early brought to maturity, it is a phenomenon not a little singular in the progress of arts. The Greek tragedy made a rapid progress from Theſpis to Sophocles and Euripides, whose compositions are wonderful productions of genius, considering that the Greeks at that period were but beginning to emerge from roughness and barbarity into a taste for literature. The compositions of Æschylus, Sophocles, and Euripides, must have been highly relished among a people who had no idea of any thing more perfect. We judge by comparison, and every work is held to be perfect that has no rival. It ought at the same time to be kept in view, that it was not the dialogue which chiefly enchanted the Athenians, nor variety in the passions represented, nor perfection in the actors; but machinery and pompous decoration, joined with exquisite music. That these particulars were carried to the greatest height, we may with certainty conclude from the extravagant sums bestowed on them: the exhibiting a single tragedy was more expensive to the Athenians, than their fleet or their army in any single campaign.

One would imagine, however, that these compositions were too simple to enchant for ever; as variety in action, sentiment, and passion, is requisite, without which the stage will not continue long a favourite entertainment: and yet we find not a single improvement attempted after the days of Sophocles and Euripides. The manner of performance, indeed, prevented absolutely any improvement. A fluctuation of passion and refined sentiments would have made no figure on the Grecian stage. Imagine the discordant scene between Brutus and Cassius in Julius Cæsar to be there exhibited, or the handkerchief in the Moor of Venice: how slight would be their effect, when pronounced in a mask, and through a pipe? The workings of nature upon the countenance, and the flexions of voice expressive of various feelings, so deeply affecting in modern representation, would have been entirely lost. If a great genius had arisen with talents for composing a pathetic tragedy in perfection, he would have made no figure in Greece. An edifice must have been erected of a moderate size: new actors must have been trained to act with a bare face, and to pronounce in their own voice. And after all there remained a greater miracle still to be performed, viz. a total reformation of taste in the people of Athens. In one word, the simplicity of the Greek tragedy was suited to the manner of acting; and that manner excluded all improvements.

With respect to *comedy*, it does not appear that the Greek comedy surpassed the tragedy in its progress toward perfection. Horace mentions three stages of Greek comedy. The first well suited to the rough and coarse manners of the Greeks, when Eupolis, Cratinus, and Aristophanes, wrote. These authors were not ashamed to represent on the stage real persons, not even disguising their names: of which we have a striking instance in a comedy of Aristophanes, called *The Clouds*, where Socrates is introduced, and most contemptuously treated. This sort of comedy, sparing neither gods nor men, was restrained by the magistrates of Athens, so far as to prohibit persons to be named on the stage. This led writers to do what is done at present: the characters and manners of known persons were painted so much to the life, that there

could be no mistake; and the satire was indeed heightened by this regulation, as it was an additional pleasure to find out the names that were meant in the representation. This was termed the *middle comedy*. But as there still remained too great scope for obloquy and licentiousness, a law was made prohibiting real events or incidents to be introduced upon the stage. This law happily banished satire against individuals, and confined it to manners and customs in general. Obedient to this law are the comedies of Meander, Philemon, and Diphilus, who flourished about 300 years before the Christian æra. And this is termed the *third stage* of Greek comedy. The comedies of Aristophanes, which still remain, err not less against taste than against decency. But the Greek comedy is supposed to have been considerably refined by Menander and his contemporaries. Their works, however, were far from perfection, if we can draw any conjecture from their imitator Plautus, who wrote about a century later. Plautus was a writer of genius; and it may be reasonably supposed that his copies did not fall much short of the originals, at least in matters that can be faithfully copied; and he shews very little art, either in his compositions, or in the conduct of his pieces. With respect to the former, his plots are wondrous simple, very little varied, and very little interesting. The subject of almost every piece is a young man in love with a music-girl, desiring to purchase her from the procurer, and employing a favourite slave to cheat his father out of the price; and the different ways of accomplishing the cheat is all the variety we find. In some few of his comedies the story rises to a higher tone, the music-girl being discovered to be the daughter of a free-man, which removes every obstruction to a marriage between her and her lover. In the conduct of his pieces there is a miserable defect of art. Instead of unfolding the subject in the progress of the action, as is done by Terence, and by every modern writer, Plautus introduces a person for no other end but to explain the story to the audience. In one of his comedies, a household-god is so obliging as not only to unfold the subject, but to relate before-hand every particular that is to be represented, not excepting the catastrophe.

The *Roman theatre*, from the time of Plautus to that of Terence, made a rapid progress. Aristotle defines comedy to be "an imitation of light and trivial subjects, provoking laughter." The comedies of Plautus correspond accurately to that definition: those of Terence rise to a higher tone.

Nothing is more evident than the superiority of Terence above Plautus in the art of writing; and, considering that Terence is a later writer, nothing would appear more natural, if he did not copy the same originals. It may be owing to genius that Terence excelled in purity of language, and propriety of dialogue; but how account for his superiority over Plautus in the construction and conduct of a play? It will not certainly be thought, that Plautus would imitate the worst constructed plays, leaving the best to those who should come after him. This difficulty does not seem to have occurred to any of the commentators. Had the works of Menander and of his contemporaries been preserved, they probably would have explained the mystery; which for want of that light will probably remain a mystery for ever.

Homer has for more than 2000 years been held the prince of poets. Such perfection in an author who flourished when arts were far short of maturity, is truly wonderful. The nations engaged in the Trojan war are described by him as in a progress from the shepherd-state to that of agriculture. Frequent mention is made in the Iliad of the most eminent men being shepherds. Andromache, in particular, mentions seven of her brethren who were slain by Achilles as they tended their father's flocks and herds. In that state, garments

of woollen cloth were used; but the skins of beasts, the original clothing, were still worn as an upper garment: every chief in the Iliad appears in that dress. Such indeed was the simplicity of this early period, that a black ewe was promised by each chief to the man who would undertake to be a spy. In times of such simplicity, literature could not be far advanced; and it is a great doubt, whether there was at that time a single poem of the epic kind for Homer to imitate or improve upon. Homer is undoubtedly a wonderful genius, perhaps the greatest that ever existed: his fire, and the boldness of his conceptions, are inimitable. But in that early age, it would fall little short of a real miracle, to find such ripeness of judgment, and correctness of execution, as in modern writers are the fruits of long experience and progressive improvements during the course of many centuries. Accordingly, that Homer is far from being so ripe, or so correct, cannot escape the observation of any reader of taste and discernment. One striking particular is, his digressions without end, which draw our attention from the principal subject. Diomedes, for instance, meeting with Glaucus in the field of battle, and doubting, from his majestic air, whether he might not be an immortal, enquires who he was, declaring that he would not fight with a god. Glaucus lays hold of this very slight opportunity, in the very heat of action, to give a long history of his family. In the mean time, the reader's patience is put to a trial, and his ardour cools. Again, Agamemnon desiring advice how to resist the Trojans, Diomedes springs forward; but, before he offers advice, gives the history of all his progenitors, and of their characters, in a long train. And, after all, what was the sage advice that required such a preface? It was, that Agamemnon should exhort the Greeks to fight bravely. At any rate, was Diomedes so little known, as to make it proper to suspend the action at so critical a juncture, for a genealogical history? There is a third particular, which justly merits censure; and that is, an endless number of minute circumstances, especially in the description of battles, where they are most improper. The capital beauty of an epic poem is, the selection of such incidents and circumstances as make a deep impression, keeping out of view every thing low or familiar. An account of a single battle employs the whole fifth book of the Iliad, and a great part of the sixth: yet in the whole there is no general action; but unknown warriors, whom we never heard of before, killed at a distance with an arrow or a javelin; and every wound described with anatomical accuracy. The whole seventeenth book is employed in the contest about the dead body of Patroclus, stuffed with minute circumstances, below the dignity of an epic poem. In such scenes the reader is fatigued with endless particulars; and has nothing to support him but the melody of Homer's versification.

Having traced the progress of the fine arts toward maturity, in a summary way, the *decline of these arts* comes next in order. An art, in its progress toward maturity, is greatly promoted by emulation; and, after arriving at maturity, its downfall is not less promoted by it. It is difficult to judge of perfection but by comparison; and an artist, ambitious to outstrip his predecessors, cannot submit to be an imitator, but must strike out something new, which, in an art advanced to ripeness, seldom fails to be a degeneracy. This cause of the decline of the fine arts may be illustrated by various instances. The perfection of vocal music is to accompany passion, and to enforce sentiment. In ancient Greece, the province of music was well understood; which, being confined within its proper sphere, had an enchanting influence. Harmony at that time was very little cultivated, because it was of very little use: melody reaches the heart, and it is by it chiefly that a sentiment is enforced, or a passion soothed: harmony, on the con-

trary, reaches the ear only; and it is a matter of undoubted experience, that the most melodious airs admit but of very simple harmony. Artists, in latter times, ignorant why harmony was so little regarded by the ancients, applied themselves seriously to its cultivation; and they have been wonderfully successful. But they have been successful at the expence of melody; which, in modern compositions, generally speaking, is lost amid the blaze of harmony. These compositions tickle the ear by the luxury of complicated sounds, but seldom make any impression on the heart. The Italian opera, in its form, resembles the Greek tragedy, from which it is evidently copied; but very little in substance. In the latter, music being made subservient to sentiment, the dialogue is nervous and sublime: in the former, the whole weight is laid on music; and the dialogue, devoid of sentiment, is weak and spiritless. Restless man knows no golden mean, but will be attempting innovations without end.—By the same ambition, architecture was visibly declined from its perfection. The Ionic was the favourite order when architecture was in its height of glory. The Corinthian order came next; which, in attempting greater perfection, has deviated from the true simplicity of nature: and the deviation is still greater in the Composite order. With respect to literary productions, the first essays of the Romans were very imperfect. We may judge of this from Plautus, whose compositions are abundantly rude, though much admired by his contemporaries, being the best that existed at that time. The exalted spirit of the Romans hurried them on to the grand and beautiful; and literary productions of all kinds were in perfection when Augustus reigned. In attempting still greater perfection, the Roman compositions became a strange jumble of inconsistent parts: they were tumid and pompous; and, at the same time, full of antitheses, conceit, and tinsel wit. Every thing new in the fine arts pleases, though less perfect than what we are accustomed to; and, for that reason, such compositions were generally relished. We see not by what gradual steps writers, after the time of Augustus, deviated from the patterns that were before them; for no book of any moment after that time is preserved, till we come down to Seneca, in whose works nature and simplicity give place to artificial thought and bastard wit. He was a great corrupter of the Roman taste; and after him nothing was relished but brilliant strokes of fancy, with very little regard to sentiment: even Virgil and Cicero made no figure in comparison. Lucan has a forced elevation of thought and style, very difficult to be supported; and, accordingly, he sinks often into puerile reflections; witness his encomium on the river Po, which, says he, would equal the Danube, had it the same number of tributary streams. Quintilian, a writer of true and classical taste, who was protected and encouraged by Vespasian, attempted to stem the tide of false writing. His rhetoric is composed in an elegant style; and his observations contain every delicacy of the critical art. At the same time flourished Tacitus, possessing a more extensive knowledge of the nature of man than any other author, ancient or modern, if Shakspeare be not excepted. His style is original, concise, compact, and comprehensive; and, in what is properly called his *history*, perfectly correct and beautiful. He has been imitated by several, but never equalled by any. Brutus is said to be the last of the Romans for love of liberty: Quintilian and Tacitus may be said to be the last of the Romans for literary genius. Pliny the Younger is no exception: his style is affected, turgid, and full of childish brilliancy. Seneca and Pliny are proper examples of writers who study show more than substance, and who make sense yield to sound. The difference between these authors and those of the Augustan age, resembles the difference between Greek and Italian music. * Music, among the Greeks,

limited itself to the employment to which it is defined by nature, viz. to be the handmaid of sense, to enforce, enliven, or sweeten a sentiment. In the Italian opera, the mistress is degraded to be handmaid; and harmony triumphs, with very little regard to sentiment.

Another great cause that precipitates the downfall of every fine art is despotism. The reason is obvious; and there is a dismal example of it in Rome, particularly with regard to eloquence. We learn from a dialogue accounting for the corruption of the Roman eloquence, that in the decline of the art it became fashionable to stuff harangues with impertinent poetical quotations, without any view but ornament merely; and this also was long fashionable in France. It happened unfortunately for the Romans, and for the world, that the fine arts were at their height in Rome, and not much upon the decline in Greece, when despotism put an end to the republic. Augustus, it is true, retarded their fall, particularly that of literature; it being the politic of his reign to hide despotism, and to give his government an air of freedom. His court was a school of urbanity, where people of genius acquired that delicacy of taste, that elevation of sentiment, and that purity of expression, which characterize the writers of his time. He honoured men of learning, admitted them to his table, and was bountiful to them. It would be painful to follow the decline of the fine arts in Rome to their total extirpation. The tyranny of Tiberius, and of subsequent emperors, broke at last the elevated and independent spirit of the brave Romans, reduced them to abject slavery, and left not a spark of genius. The science of law is the only exception, as it flourished even in the worst of times: the Roman lawyers were a respectable body, and less the object of jealousy than men of power and extensive landed property. Among the Greeks also, a conquered people, the fine arts decayed; but not so rapidly as at Rome; the Greeks, farther removed from the seat of government, being less within the reach of a Roman tyrant. During their depression, they were guilty of the most puerile conceits; witness verses composed in the form of an ax, an egg, wings, and such like. The style of Greek authors, in the reign of the Emperor Adrian, is unequal, obscure, stiff, and affected. Lucian is the only exception that may be made.

We need scarce any other cause but despotism, to account for the decline of *statuary and painting* in Greece. These arts had arrived at their utmost perfection about the time of Alexander the Great; and from that time they declined gradually with the vigour of a free people: for Greece was now enslaved by the Macedonian power. It may in general be observed, that when a nation becomes stationary in that degree of power which it acquires from its constitution and situation, the national spirit subsides, and men of talents become rare. It is still worse with a nation that is sunk below its former power and pre-eminence; and worst of all when it is reduced to slavery. Other causes concurred to accelerate the downfall of the arts mentioned. Greece in the days of Alexander was filled with statues of excellent workmanship; and there being little demand for more, the later statuary was reduced to heads and busts. At last the Romans put a total end both to statuary and painting in Greece, by plundering it of its finest pieces; and the Greeks, exposed to the avarice of the conquerors, bestowed no longer any money on the fine arts.

The decline of the fine arts in Rome is by Petronius Arbitrator, a writer of taste and elegance, ascribed to a cause different from any above mentioned, a cause that overwhelms manhood as well as the fine arts wherever it prevails; and that is *opulence*, joined with its faithful attendants avarice and luxury. "In ancient times (says he), when naked virtue had her admirers, the liberal arts were in their highest vigour; and there was a generous contest among men, that nothing of real and

permanent advantage should long remain undiscovered. Democritus extracted the juice of every herb and plant; and, left the virtue of a single stone or twig should escape him, he consumed a lifetime in experiments. Eudoxus, immersed in the study of astronomy, spent his age upon the top of a mountain. Chrysis, to stimulate his inventive faculty, thrice purified his genius with hellebore. To turn to the imitative arts: Lyfippus, while labouring on the forms of a single statue, perished from want. Myron, whose powerful hand gave to the brass almost the soul of man, and animals—at his death found not an heir! Of us of modern times what shall we say? Immersed in drunkenness and debauchery, we want the spirit to cultivate those arts which we possess. We inveigh against the manners of antiquity; we study vice alone; and vice is all we teach. Where now is the art of reasoning? Where astronomy? Where is the right path of wisdom? What man now-a-days is heard in our temples to make avow for the attainment of eloquence, or for the discovery of the fountain of true philosophy? Nor do we even pray for health of body, or a sound understanding. One, while he has carved entered the porch of the temple, devotes a gift in the event of the death of a rich relation; another prays for the discovery of a treasure; a third for a ministerial fortune. The senate itself, the exemplary preceptor of what is good and laudable, has promised a thousand pounds of gold to the capitol; and, to remove all reproach from the crime of avarice, has offered a bribe to Jupiter himself. How should we wonder that the art of painting has declined, when, in the eyes both of the gods and men, there is more beauty in a mass of gold, than in all the works of Phidias and Apelles."—In England, the fine arts are far from such perfection as to suffer by opulence. They are in a progress, it is true, toward maturity: but they proceed in a very slow pace.

There is still another cause that never fails to undermine a fine art in a country where it is brought to perfection, abstracting from every one of the causes above mentioned. It is remarked a little above, that nothing is more fatal to an art or to a science than a performance so much superior to all of the kind as to extinguish emulation. This remark is exemplified in the great Newton, who, having surpassed all the ancients, has not left to his countrymen even the faintest hope of rivaling him; and to that cause is attributed the visible decline of mathematics in Great Britain. The same cause would have been fatal to the arts of statuary and painting among the Greeks, even though they had continued a free people. The decay of painting in modern Italy is, probably, owing to the same cause: Michael Angelo, Raphael, Titian, &c. are lofty oaks that bear down young plants in their neighbourhood, and intercept from them the sunshine of emulation. Had the art of painting made a slower progress in Italy, it might have there continued in vigour to this day. Velleius Paterculus says judiciously, "Ut primo ad consequendos quos priores docimus accendimur; at, ubi aut præteriti aut æquari eos posse desperavimus, studium cum spe fenescit; et quod adsequi non potest, sequi definit: præteritque eo in quo eminere non possumus, aliquid in quo nitamur conquirimus."

The decline of an art or science proceeding from the foregoing cause, is the most rapid where a strict comparison can be instituted between the works of different masters. The superiority of Newton above every other mathematician can be ascertained with precision; and hence the sudden decline of that science in Great Britain. In Italy a talent for painting continued many years in vigour, because no painter appeared with such superiority of genius as to carry perfection in every branch of the art. As one surpassed in designing, one in colouring, one in graceful attitudes, there was still scope for emulation. But when at last there was not a single perfection but what one

or other master had excelled in, from that period the art began to languish. Architecture continued longer in vigour than painting, because the principles of comparison in the former are less precise than in the latter. The artist who could not rival his predecessors in an established mode, fought out a new mode for himself, which though perhaps less elegant or perfect, was for a time supported by novelty.

Useful Arts will never be neglected in a country where there is any police; for every man finds his account in them. Fine arts are more precarious. They are not relished but by persons of taste, who are rare; and such as can spare great sums for supporting them, are still more rare. For that reason they will never flourish in any country, unless patronised by the sovereign, or by men of power and opulence. They merit such patronage, as one of the springs of government: and a capital spring they make, by multiplying amusements, and humanizing manners; upon which account they have always been encouraged by good princes.

General Theory of the Polite Arts. The essence of the polite arts, as before observed, consists in *expression*. The end of all these arts is *pleasure*; whereas the end of the sciences is *instruction and utility*. Some of the polite arts indeed, as eloquence, poetry, and architecture, are frequently applied to objects that are useful, or exercised in matters that are instructive, as we shall then more particularly in their proper place; but in these cases, though the ground-work belongs to those sciences which employ the understanding, yet the expression arises from the inventive faculty. It is a picture that is designed by Minerva, to which the muses add the colouring, and the graces the frame. This union forms therefore the perfection of the art, according to that sententious and well-known precept of Horace: *Omne tulit punctum, qui miscuit utile dulci*.

Under the denomination, therefore, of Polite Arts, we comprehend, 1. Eloquence; 2. Poetry; 3. Music; 4. Painting; 5. Sculpture; 6. Graving; 7. Architecture; 8. Declamation; 9. Dancing. Particular descriptions of these arts are given under their respective names. This branch of the present article is intended as a general introduction to them; and, as such, will be occasionally referred to.

There is one very essential reflection, which it appears to us proper to make in the first place, on the polite arts in general. All the rules in the world are not sufficient to make a great poet, an able orator, or an excellent artist; because the quality, necessary to form these, depends on the natural disposition, the fire of genius, which no human art can confer, but which is the pure gift of Heaven. The rules, however, will prevent a man from being a bad artist, a dull orator, or a wretched poet; seeing they are the reflections of the greatest masters in those arts, and that they point out the rocks which the artist should shun in the exercise of his talents. They are of use, moreover, in facilitating his labours, and in directing him to arrive by the shortest and surest road to perfection. They refine, strengthen, and confirm his taste. Nature, abandoned to herself, has constantly something wild and savage. Art, founded on just and sagacious rules, gives her elegance, dignity, and politeness; and it is impossible to sacrifice properly to the graces, without knowing the incense that is pleasing to them.

Beauty is the object of all the polite arts. It is not however so easy, as it may seem, to give a clear and determinate idea of what we precisely mean by that term. Many able writers, who have treated expressly on the subject, have shewn that they were totally ignorant of what it was. It is one of those expressions that we comprehend immediately, that present us with a clear and precise idea, that leave a distinct impression on our minds, when it is simply written or pronounced; but which philosophers envelope in darkness, when they attempt to elucidate it by definitions and descriptions; and the

more, as mankind have different ideas of beauty, their opinions and tastes being as various as their understandings and physiognomies. We may say, however, in general, that beauty results from the various perfections of which any object is susceptible, and which it actually possesses; and that the perfections which produce beauty consist principally in the agreeable and delightful proportions which are found, 1. Between the several parts of the same object; 2. Between each part and the whole together; 3. Between the parts and the end or design of the object to which they belong. *Genius*, or invention, is that faculty of the mind by which *beauty* is produced. *Taste*, disposition, or rather the natural sensation of the mind refined by art, serves to guide the genius in discerning, embracing, and producing, that which is beautiful of every kind. From whence it follows, that the general theory of the polite arts is nothing more than the knowledge of what they contain that is truly beautiful and agreeable; and it is this knowledge, this theory, which modern philosophers call by the Latin name of *aesthetica*.

It should be constantly remembered, that the essence of the polite arts consists in expression. This expression lies sometimes in the words, and sometimes in the pen; sometimes in sounds and their harmony, and at others in corporeal attitudes; sometimes in the pencil or in the chisel, and at others in the graver; sometimes in a proper disposition or judicious employment of the mechanic arts, and at others merely in their manner of acting. From whence arise those arts that we have mentioned, and which are described in their order.

The general theory of the polite arts, or *aesthetics*, necessarily supposes, therefore, certain rules; but these general rules are of no great number. The first is, That whoever would devote himself to the polite arts, should above all things consult his *genius*: divest himself of all self-love; and examine if he be a true son of Apollo, and cherished by the muses: for

In vain, rash author, dost thou strive to climb,
By lofty verse, Parnassus' height to sublime,
If Heaven does not by secret powers inspire,
Or if thy natal stars dart not poetic fire.

This precept, with regard to poetry in particular, is applicable to all the polite arts in general; for their most happy success is founded on *imagination*. By this term we understand, in general, a faculty of the mind, a particular genius, a lively invention, a certain subtil spirit, which gives a facility in discovering something new. But it is necessary also to prescribe just bounds to this term *new*, which must not be here taken in an absolute sense. Solomon wisely remarks, that, even in his time, *there was nothing new under the sun*. In fact, all that exists, and all that is capable of being discovered in the known world, has already been discovered. The fine arts in their imitations of nature, in their expressions, can borrow images, figures, comparisons, from those things only that exist and are known. As there have been, from the beginning of the world to our days, millions of authors in each of the polite arts, almost all the possible combinations of the various subjects have been produced by their lively imaginations; and when we hear the ignorant part of mankind talk of a work of wit or of art that is *entirely new*, that offers ideas which were before utterly unknown, that had never entered into the brain of any other man, we should refer such assertions to the class of popular errors; and reflect on those stories we every day hear of certain empirics, who pretend to be alone possessed of marvellous methods of cure by means of simples; as if there were any plant, any stalk of grass that grows in our world, that can have escaped the researches of botanists. But the novelty, of which we here speak, consists in the ingenious use of combinations of all the various objects of nature, that are new, happy, and agreeable, that have not yet been exhausted, and

which appear even to be inexhaustible; and of the use which the artist makes of all new discoveries, which he turns to his advantage, by a judicious application. Invention therefore supposes a considerable fund of preliminary knowledge, such as is capable of furnishing ideas and images, to form new combinations. But there is no art by which invention itself can be produced; for that, as we have already said, is the gift of Heaven; and it is an endowment which we cannot even make use of whenever we please. We would rather say, therefore, that invention consists in producing, in works of genius, *that which is unexpected*; an object, a harmony, a perfection, a thought, an expression, of which we had no idea, that we could not foresee, nor hope to find, where the artist has so happily placed it, and where we perceive it with delight. This idea appears applicable to such of the polite arts as affect the mind by the hearing as well as by the sight; and it is a matter that is highly essential.

The *second rule* is, That every artist ought incessantly to labour in the improvement of his *taste*; in acquiring that sensible, refined, and clear discernment, by which he will be enabled to distinguish the real beauties in each object, the ornaments that are agreeable to it, and the proportions and relations that subsist among the several parts: and by this faculty, he will be regulated in the employment of his natural talents. This labour consists not only in the profound reflections he will make on the properties of objects as they relate to the fine arts, but also in a constant, assiduous study of the grand models of beauty.

The *third rule*, to be observed in the practice of the polite arts, is the *imitation of nature*. Every object in the universe has its peculiar nature, of which the artist should never lose sight in his manner of treating it. In vain will he otherwise ornament his work with the most refined and most brilliant strokes; for, if nature be not justly imitated, it will for ever remain imperfect. The sublime Homer has sometimes sinned against this rule: for, as the gods have a nature peculiar to themselves, it cannot be a just imitation when we attribute to them passions that are scarce pardonable in mortals, and make them frequently converse in a language that is at once vulgar and ridiculous. It was not to imitate nature, to put into the mouth of a hero, at the moment of a decisive battle, an harangue that must become tedious by its excessive length, and which certainly could not have been heard by the thousandth part of a numerous army: but we have already touched upon some of the faults that are sown over the poems of that great man; to multiply or dwell upon them would be ungrateful. We must however observe, that this imitation of nature, which appears at first view so simple and so easy, is of all things the most difficult in practice; and that it requires a discernment so sagacious, and an expression so happy, as is rarely bestowed by Heaven on mortal man.

Persepicity forms the fourth rule of expression. In all the fine arts, in general, an obscure, perplexed, ambiguous, and elaborate expression, is always bad. The true, striking beauty must be manifest, and perceptible to the most ignorant of mankind as well as the most learned. Those are very false or inferior beauties that have occasion for a covering, a kind of veil that may make them appear greater than they really are: true beauty wants no veil, but shines by its native lustre. From the union of the true imitation of nature with persepicity of expression arises that *truth* which is so essential in the productions of the fine arts.

In all the polite arts, and in all the subjects they embrace, there must necessarily reign an *elevation of sentiment*, that expresses each object in the greatest perfection of which it is susceptible; that imitates Nature in her most exalted beauty. This makes the fifth general rule. The design of the fine arts

being to excite pleasure by the expression of that which is beautiful, every artist should raise himself above his subject; and, choosing the most favourable light wherein to place it, should there embellish it with the greatest, most noble, and beautiful ornaments, that his own genius can suggest; still, however, observing a strict imitation of nature.

From the observation of these two last rules results the *sublime*, which is the union of the greatest persepicity with the strictest truth and most exalted elevation possible. It is necessary to remark here, that the most simple and common subjects are susceptible of a sublime that is agreeable to their nature. An idyl or landscape may be as sublime in their kinds as an epic poem or a history-piece. When Moses begins the book of Genesis with these words, *In the beginning, God created the heaven and the earth*; or when he tells us, that God said, *Let there be light, and there was light*; these expressions are sublime in the highest degree, because they are perfectly clear, true, and elevated. Every author should therefore endeavour after the sublime in every subject that he undertakes; and this makes the sixth and last general rule in the practice of the polite arts. But if he cannot attain to this, it is, however, indispensably necessary that he constantly make use of expressions that are *noble and refined*. Every thing that is *low, indecent, or disjagreeable*, is naturally repugnant to the sublime, and ought to be for ever banished from all works that proceed from the noble and liberal arts.

ARTABANUS, the name of several kings of Parthia. See PARTHIA.

ARTABAZUS, the son of Pharnaces, commanded the Parthians and Chorasmians in the famous expedition of Xerxes. After the battle of Salamis, he escorted the king his master to the Hellespont with 60,000 chosen men; and after the battle of Plataea, in which Marodonius engaged contrary to his advice, he made a noble retreat, and returned to Asia with 40,000 men under his command.

ARTALIS (Joseph), born at Mazara in Sicily, 1628, had an early passion for poetry, and a strong inclination for arms. He finished his studies at fifteen years of age, about which time he fought a duel, in which he mortally wounded his adversary. He saved himself by taking shelter in a church; and it was owing to this accident that he afterwards applied himself to the study of philosophy. His parents being dead, and himself much embarrassed in his circumstances, he resolved to quit his country, and seek his fortune elsewhere. He accordingly went to Candia, at the time when that city was besieged by the Turks; and gave there so many proofs of his bravery, that he obtained the honour of knighthood in the military order of St. George. When he was upon his return for Italy, he was often obliged to draw his sword: he was sometimes wounded in these encounters, but being an excellent swordsman had often the advantage. He rendered himself so formidable even in Germany, that they used to style him *Chevalier de Sang*. Earnest duke of Brunswick and Lunenburg appointed him captain of his guards; but this did not make him neglect the muses, for he cultivated them amidst the noise of arms. He was member of several academies in Italy, and became highly in favour with many princes, especially the Emperor Leopold. He died in 1679 at Naples.

ARTAXATA, *orum*, the royal residence, and metropolis of Armenia Major (Strabo, Pliny, Juvenal), and built according to a plan of Hannibal, for King Artaxias, after whom it was called. It was situated on an elbow of the river Araxes, which formed a kind of peninsula, and surrounded the town like a wall, except on the side of the lithmus, but this side was secured by a rampart and ditch. This town was deemed so strong, that Lucullus, after having defeated Tigranes, durst not lay siege to it; but Pompey compelled him to deliver it

up without striking a blow. It was then levelled with the ground; but the Armenians have a tradition that the ruins of it are still to be seen at a place called *Ardachat*. Sir John Chardin says, that it has the name of *Ardachat* from Artaxias, whom in the East they call *Ardechir*. Here are the remains of a stately palace which the Armenians take to be that of Tiridates who reigned in the time of Constantine the Great. One front of this building is but half ruined, and there are many other fine antiquities which the inhabitants call *Tach*, *Tardat*, that is, the throne of Tiridates. Tavernier also mentions the ruins of Artaxata between Erivan and mount Ararat, but does not specify them. The ancient geographers mention another city of the same name, likewise situated on the Araxis, but in the northern part of Media, known among the ancients by the name of *Atropatia*.

ARTAXERXES, the name of several kings of Persia. See Persia.

ARTEMIDORUS, famous for his Treatise upon Dreams. He was born at Ephesus, but took upon him the surname of *Dadrianus* in this book, by way of respect to his mother's country, Daltis. He styled himself the *Ephesian* in his other performances. He not only bought up all that had been written concerning the explication of dreams, which amounted to many volumes; but he likewise spent many years in travelling, in order to contract an acquaintance with fortune-tellers: he also carried on an extensive correspondence with all the people of this sort in the cities and assemblies of Greece, Italy, and the most populous islands; collecting at the same time all the old dreams, and the events which are said to have followed them. The work which he wrote on dreams consisted of five books: the first three were dedicated to one Cassius Maximus; and the last two to his son, whom he took a good deal of pains to instruct in the nature and interpretation of dreams. This work, though filled with frivolous observations, contains some things that are interesting. It was first printed in Greek, at Venice, in 1518; and Rigaltius published an edition at Paris, in Greek and Latin, in 1603, and added some notes. Artemidorus wrote also a treatise upon Auguries, and another upon Chirurgery; but they are not extant. He lived under the Emperor Antoninus Pius.

ARTEMISIA, wife of Mausolus king of Caria, has immortalized herself by the honours which she paid to the memory of her husband. She built for him in Halicarnassus a very magnificent tomb, called the *Mausoleum*, which was one of the seven wonders of the world, and from which the title of *mausoleum* was afterwards given to all tombs remarkable for their grandeur: but she died of regret and sorrow before the Mausoleum was finished. She appointed panegyrics to be made in honour of him, and propoled a prize of great value for the person who should compose the best. He died about the end of the 16th Olympiad, 351 years before the Christian æra.

ARTEMISIA, queen of Caria, and the daughter of Ligdamis, thrived in person in the expedition of Xerxes against the Greeks, and performed wonders in the sea-fight near Salamis, 480 years before the Christian æra. Being pursued by an Athenian vessel, she attacked one of the Persian ships, commanded by Demasthymus, king of Calyndus, her enemy, and sunk it; on which the Athenians, thinking that her ship was on the side of the Greeks, ceased their pursuit: but Xerxes was the principal person imposed upon in this affair; for believing she had sunk an Athenian vessel, he declared, that "the men had behaved like women, and the women like men." Xerxes intrusted her with the care of the young princes of Persia, his sons; when, agreeably to her advice, he abandoned Greece, in order to return to Asia. These great qualities did not secure her from the weakness of love: she was passionately fond of a man of

Abydos, whose name was Dardanus, and was so enraged at his neglect of her, that she put out his eyes while he was asleep. The gods, in order to punish her for this, inspired her with still a stronger passion for him; so that the oracle having advised her to go to Leucas, which was the refuge of desperate lovers, she took the leap from thence, and was interred at that place.—Many writers confound this Artemisia with the former, the wife of Mausolus.

ARTEMISIUM, either a promontory (Harpocration), or a part of the sea-coast, on the north-east of Eubœa (Plutarch); called *Leon*, and *Cale Æbe* (Ptolemy); memorable for the first fee-engagement between the Greeks and Xerxes.—Another promontory of Caria (Strabo). A third in Spain, now called *Cape Martin*, in Valencia: in the meridian of London, and lat. 38. 50.

ARTEMISIUM, a town of Oenotria (Stephanus): now *S. Agatha*, in the Hither Calabria, on the river Pisaurus, or *La Foglia*, distant eight miles from the Tuscan Sea.—Another of the Contestani, in Spain (Strabo); otherwise called *Danium*: now *Denia*, on the sea-coast of Valencia. W. long. 20. Lat. 39.

ARTHRINGTON (Henry), a gentleman of a good family in Yorkshire, who, towards the latter end of the reign of Queen Elizabeth, engaged in some seditious practices against the government. He was a man of moderate sense and learning, zealously addicted to the Geneva discipline, and was engaged for several years in distributing books in defence of a farther reformation, and containing severe reflections on the lords of the privy-council, the judges, and other magistrates. In the prosecution of his designs, he became acquainted with Mr. Edmund Copping, a younger brother of a good family, and sworn servant to Queen Elizabeth, who was as far gone as himself in fanatical opinions, and who was continually representing to him the necessity of a thorough reformation in church and state. This acquaintance of theirs lasted several years, till by frequent conversations, hearing warm sermons, and praying together, they had greatly heated their imaginations, in consequence of which, they began to believe themselves very extraordinary persons. Some time in Easter term, 1591, Copping became acquainted with Hacket, and soon after introduced Arthington also to his acquaintance. On Thursday, the 14th of July, 1591, Arthington penned his prophecy of judgments against England. Copping also drew up a life of Hacket, which Arthington wrote over again for, and annexed to it his prophecy. The same day they penned a joint letter to Mr. Thomas Lancaster, a school-master, signed by Copping as the messenger of peace, and by Arthington as the prophet of God's judgments, though it seems Arthington did well know why he styled himself so. For on Friday, the 15th of July, Copping having sent for Arthington out of his bed, declared to him, that he had had a revelation, which assured him that he was prophet of mercy, and Arthington prophet of judgment; that Hacket was king of Europe, and that they were to go before him, and separate the sheep from the goats. Arthington the more readily credited this, because he found a mighty burning in himself, which he interpreted a commencement of the angelic nature. Their first exploit was to go together to the house of a gentleman in the city, between six and seven in the morning, to appoint him chief governor under his majesty; but he would have nothing to do with them, nor would he suffer them to pray. Then they went to Wood-street Compter, to Mr. Wigginton, a minister, with whom they had a long conference; then they left him and went to Hacket's chamber, at the house of one Walker, at Broken Wharf. Afterwards they went together towards Cheap-side, by Watling-street, and the Old Change, crying out, "Christ is come," &c. To this Arthington added, "Repent, England, repent;"

threatening also strange judgments against the city of London. A paper was taken out of Arthington's sleeve, which he said he was glad of, for it was an epistle to the queen, which she would not receive, and therefore she was no longer queen, but deprived of her dignity. About one o'clock they were apprehended and conducted to the lord mayor's, where several privy-councillors were met, to whom Arthington refused to shew the least respect. He did not recede in the least from his strange notions, even after he had heard that Hacket was tried and condemned; but in the afternoon of Wednesday the 23th of July, when he was assured that Hacket was actually hanged, drawn, and quartered, he presently discerned his own delusion and great danger. Upon this he wrote in the most humble manner to the chancellor, and to the treasurer, beseeching them to pardon the injuries he had done them; and afterwards he wrote to the body of the council, giving the best account he was able of the whole business, beseeching them to intercede with her majesty for him, that he might not be proceeded against as his companions had been. As for Coppinger, he, a little after he was apprehended, ran absolutely distracted, and never recovered his senses, but obstinately refusing all nourishment, died of hunger the day after Hacket was executed. It was thought proper to detain Arthington some time in Wood-street Compter, in order to discover whether his repentance was sincere, as also whether there was no danger of his relapsing into his enthusiastic fit. But he remaining perfectly sober and sensible, the queen was pleased to extend her mercy towards him, by granting him a pardon. He afterwards recovered his reputation so far, as to be thought an honest and sincere, though a warm and weak man.

ARTICLES of Religion, in the church of England. In the beginnings of Christianity, the declaration that was required of a Christian's faith was conceived in very general terms; but, as heresies sprung up, it was found necessary to guard against them, by enlarging the creeds or confessions of faith. It was in imitation of this procedure that the reformers were so copious in stating the doctrines of the church of England in that work which is entitled, "Articles whereupon it was agreed by Archbishops and Bishops of both provinces, and the whole Clergie, in the convocation holden at London, in the year of our Lorde God 1562, according to the computation of the Church of Englands, for the voiding of the diversities of opinions, and for the establishing of consent touching true religion." There were two particular circumstances in that time which made this seem to be the more necessary: the one was, that there sprung up, together with the reformation, many impious and extravagant sects; the other, that, having but just got rid of Popery, it was absolutely necessary to take the utmost precautions against it for the future. These articles were prepared, as is most probable, by the bishops Cranmer and Ridley, and were published by royal authority. The most authentic manuscript of them is in the library of Corpus Christi College in Cambridge. It belonged to Archbishop Parker, and was left by him to that college.

The subscription to these articles is enjoined by statute, which establishes them, and requires every clergyman to declare his assent, and subscribe them in the presence of his ordinary. The form of the subscription is not prescribed by the statute; but by the canon it is expressly required, that he acknowledge them, and every one of them, to be agreeable to the word of God. There is a clause in the statute, which subjects every minister, who maintains any doctrine repugnant to these articles, to deprivation.

ARTIGI, indeclinable (Pliny); *Artigis* (Ptolemy); a town of the Turduli, in Bætica. Now *Alhama*. See *ALHAMA*.

ARTOBRIGA, a town of Vindelicia (Ptolemy); now *Altzburg*, in Bavaria, on the Danube, below Ingolstadt (Aven-

tinus); but Cluverius supposes it to be *Lebanau*, on the Saltzbach, below Lauffen, in the archbishopric of Saltzburg.

ARUCCI, a town of Bætica, in the Conventus Hispalensis (Pliny); now *Morón*, in Andalusia, from an ancient inscription; five leagues to the west of Offuna. W. long. 5. 20. Lat. 37.

ARVERNI, an appellation early used for the capital of the Arverni, according to the custom of the latter ages of naming towns from the people; it was formerly called *Nemossus* (Strabo). The *Arverni*, a brave and ancient people, and one of the most powerful nations of Gaul, claimed affinity with the Romans, as descendants from Antenor (Lucan): and after their conquest by the Romans, their ancient liberty was preserved to them, on account of their bravery (Pliny). Above 1000 years ago the town was called *Clarus Mons*, from its situation (Valesius). Now *Clermont*, in Auvergne. E. long. 3. 20. N. lat. 45. 42.

ARVIRAGUS, an ancient British king who flourished in the time of the Emperor Domitian. He gained a complete victory over Claudius; but being soon after besieged in the city of Winchester, he made a treaty with the Romans, and married the emperor's daughter Genuiffa. This monarch lived to a good old age; he confirmed the ancient laws, enacted new ones, and liberally rewarded persons of merit.

ARUN, a river which rises in the western border of Sussex, and falls into the sea below Arundel. It is famous for mullets.

ARUNDA, a town of Hispania Bætica, on the Annas, or Guadiana (Ptolemy, Pliny): now said to be *Ronda*, in the province of Granada, on the confines of Andalusia. W. long. 5. 40. Lat. 36. 26.

ARUNDEL (Thomas), archbishop of Canterbury, in the reigns of Richard II. Henry IV. and Henry V. He was the second son of Robert earl of Arundel and Warren, and brother to Richard earl of Arundel, who was beheaded. At twenty-two years of age (from being archdeacon of Taunton, he was raised to the bishopric of Ely, the 6th of April, 1375, in the reign of Edward III. He was a great benefactor to the church and palace of this see. In 1386 he was appointed lord chancellor of England; two years after, he was translated to the see of York; and in 1396, was advanced to the archiepiscopal see of Canterbury, when he resigned the chancellorship. This was the first instance of the translation of an archbishop of York to the see of Canterbury. Scarce was he fixed in this see, when he had a contest with the university of Oxford, about the right of visitation. The affair was referred to King Richard, who determined it in favour of the archbishop. At his visitation in London, he revived an old constitution, by which the inhabitants of the respective parishes were obliged to pay to their rector one halfpenny in the pound of the rent of their houses. In the second year of his translation, a parliament being held at London, the commons, with the king's leave, impeached the archbishop, together with his brother the Earl of Arundel, and the Duke of Gloucester, of high-treason. The archbishop was sentenced to be banished, and within forty days to depart the kingdom upon pain of death. He retired first to France, and then to the court of Rome, where Pope Boniface IX. gave him a kind reception, and wrote a letter to King Richard in his favour; but this having no effect, his holiness resolved to interpose his authority; he accordingly nominated Arundel to the bishopric of St. Andrew's, and declared his intention of giving him several preferments in England. The king being informed of the pope's designs, wrote a letter, which had to good an

effect upon his holiness, that he withheld his intended favours from Arundel; and, at the king's request, promoted Roger Walden to the see of Canterbury.

Next year Arundel returned to England with the Duke of Lancaster, afterwards Henry IV. upon whose accession to the throne, the pope revoked the bull granted Walden, and restored Arundel to his see. In the year 1408, Arundel began to exert himself against the Lollards, or Wickliffites: he summoned the bishops and clergy at Oxford, in order to stop the progress of this new sect, and prevent the university's being farther tainted with their opinions. In 1411, being informed that this doctrine gained ground, notwithstanding the condemnation thereof in a full congregation at Oxford, he resolved to visit the university, and apply some farther remedy. His rigorous proceedings rendered Arundel extremely odious to the Wickliffites, and his zeal for suppressing that sect, carried him to several unjustifiable severities against the heads of it, particularly against Sir John Oldcastle and Lord Cobham. This prelate died at Canterbury, the 20th of February, 1413, having held the archiepiscopal see seventeen years.

ARUNDEL (Thomas), earl of Arundel and Surrey, lord-marshal of England, who sent William Petty into Asia to search for some curious monuments of antiquity, where he bought those which we call the *Arundel marbles*, of a Turk, who had taken them from a learned man sent by the famous Pierresq into Greece and Asia upon the same design. These curious marbles were placed in the earl's house and gardens, upon the banks of the Thames, and afterwards entrusted to the care of the university of Oxford, where they now are. This chronology, engraved 264 years before the Christian æra, serves to rectify the dates of a great many events of the ancient history of Greece. The great Selden wrote a book on their contents, 1629. They have since been published by Dr. Prideaux, 1676, at Oxford; and again, at London, 1732, with commentaries, and an index, by Maittaire. The reader will meet with a correct Latin and English translation of these marbles, in *The Chronological Tables of Universal History*, by the learned Abbé Lenglet Dufrenoy, lately translated into English.

ARUSINI CAMPI, plains in Lucania, famous for the last battle fought between the Romans and Pyrrhus, and the total defeat of the latter (Fiorus, Frontinus).

ARZINA, a river of Russian Lapland, into a bay of which, in 1553, two English vessels, which had penetrated as high as the 72d degree of latitude to the coast of Spitzbergen, were forced by frosts of weather; and the crews of both were frozen to death.

ASAD-ABAD, a handsome town of Persia, 68 miles N. E. of Amadon. Long 48. 25. Lat. 36. 20. N.

ASAPH (St.) gave his name to the episcopal see of St. Asaph in Wales. He was descended of a good family in North Wales, and became a monk in the convent of Llan-Elvy, over which Kentigern the Scotch bishop of that place presided. That prelate, being recalled to his own country, resigned both his convent and cathedral to Asaph, who demeaned himself with such sanctity, that after his death Llan-Elvy lost its name, and took that of the saint. St. Asaph flourished about the year 590, under Carentinus king of the Britons. He wrote the Ordinances of his Church, the Life of his master Kentigern, and some other pieces. The time of his death is not certainly known. Bale tells us, he was the first who received union from the pope.

ASAR-ADDON, or ESAR-HADDON, the son of Sennacherib, succeeded his father about 712 years before the

Christian æra, and united the kingdoms of Nineveh and Babylon. He rendered himself master of Syria; sent a colony to Samaria; and his generals took King Manasses, and carried him loaded with chains to Babylon. Alasr-Addon died after a reign of 12 years.

ASBAMEA, a fountain of Cappadocia, near Tyana, sacred to Jupiter, and to an oath. Though this fountain bubbled up, as in a state of boiling, yet its water was cold; and never ran over, but fell back again; (Philostratus, Ammian).

ASCALON, an ancient city, and one of the five satrapies or principalities of the Philistines; situated on the Mediterranean, 43 miles to the south-west of Jerusalem (Antonie), between Azotus to the north, and Gaza to the south. The birth place of Herod the Great, thence surnamed *Ascalonita* (Stephanns). Famous for its scalions, which take name from this town (Strabo, Pliny). Now *Scalona*. E. Long. 34. 30. Lat. 31. 30.

ASCANIUS, the son of Æneas and Creusa, succeeded his father in the kingdom of the Latins, and defeated Mezentius king of the Tuscans, who had refused to conclude a peace with him. At length he founded Alba Longa; and died about 1139 years before the Christian æra, after a reign of 38 years.

ASCHAM (Roger), was born at Kirby-Wilke, near North-Allerton in Yorkshire, in the year 1516. His father was steward to the noble family of Scroop. Our author Roger was educated in the family of Sir Anthony Wingfield, who, about the year 1530, sent him to St. John's College, Cambridge, where he was soon distinguished for his application and abilities. He took his degree of bachelor of arts at the age of eighteen, was soon after elected fellow of his college, and in 1536 proceeded master of arts. In 1544 he was chosen university orator; and in 1548 was sent for to court, to instruct the Lady Elizabeth (afterwards queen) in the learned languages. In the year 1550 he attended Sir Richard Morefine, as secretary, on his embassy to the Emperor Charles V. at whose court he continued three years, and in the mean time was appointed Latin secretary to King Edward VI. But, upon the death of that prince, he lost his preferment and all his hopes, being professedly of the reformed religion; yet, contrary to his expectations, he was soon after, by the interest of his friend Lord Paget, made Latin secretary to the king and queen. In June 1554 he married Mrs. Margaret How, a lady of a good family, with whom he had a considerable fortune. It is very remarkable of Mr. Ascham, that though he was known to be a Protestant, he continued in favour not only with the ministry of those times, but with Queen Mary herself. Upon the accession of Queen Elizabeth, he was not only confirmed in his post of Latin secretary, but was constantly employed as preceptor to her Majesty in the Greek and Latin languages. He died in the year 1558, much regretted, especially by the queen, who said she had rather lost ten thousand pounds. Camden and some other writers tell us, that he had a great propensity to dice and cock-fighting. He certainly died poor. He wrote,

1. *Toxophilus*. The scholæ or partitions of shooting, contained in two books, written by Roger Ascham, 1544, and now newly perused. Pleasant for all gentlemen and yeomen of England, &c. Lond. 1571. Whilst at the university he was fond of archery by way of exercise and amusement, for which he was censured; and on that account he sat down to write this book, which was dedicated to Henry VIII. who settled a pension of 10l. per annum on

the author. It is rather whimsical; but is admirably well written, and full of learning. 2. A report and discourse, written by Roger Afham, of the affairs and state of Germany, and the Emperor Charles, his court, &c. 4to. A valuable curiosity. 3. The Schoolmaster. First printed in 1573, 4to. Mr. Upton published an edition with notes in 1711. It has uncommon merit; abounding in great good sense, as well as knowledge of ancient and modern history: it is also expressive of the great humanity of the author, who was for making the paths of knowledge as level and pleasant as possible, and for trying every gentle method of enlarging the mind and winning the heart. 4. Latin Epistles. First published by Mr. Grant in 1576; have since passed many editions: the best is that of Oxford in 1703: Much admired on account of the style, and esteemed almost the only classical work of that kind written by an Englishman. 5. *Apoloogia contra misam*: 1577, 8vo.

ASCHERLEBEN, a town of Germany, in the principality of Anhalt, seated on the river Elbe.

ASCLEPIADES, one of the most celebrated physicians among the ancients, was a native of Prusa, in Bithynia; and practised physic at Rome, under Pompey, ninety-six years before the Christian æra. He was the head of a new sect; and, by making use of wine and cold water in the cure of the sick, acquired a very great reputation. He wrote several books, which are frequently mentioned by Galen, Celsus, and Pliny; but they are now lost.

ASCLEPIADES, a famous physician under Hadrian, of the same city with the former: he wrote several books concerning the composition of medicines, both internal and external.

ASCONIUS (PEDIANUS), an ancient grammarian of Padua; and, if we believe Servius, an acquaintance of Virgil's. Yet Jerome says that he flourished under the Vespasians, which is rather at too great a distance for one and the same man; but Jerome's account is rejected by the learned. We have some Commentaries of Asconius upon the Orations, which indeed are but fragments: they have been published separately, but they are to be found in many editions of Cicero's works.

ASCOT HEATH, a famous race-ground, four miles from Windsor, in the road from the Great Park to Reading. Here the King's stag-hounds are kept.

ASCOUGH (WILLIAM), doctor of laws, and bishop of Salisbury, in the reign of King Henry VI. was descended from a very ancient family, seated at Kelsey in Lincolnshire. He was consecrated to the afore-mentioned see in the chapel of Windsor, July 20, 1438: soon after which he was appointed king's confessor; this being the first instance of a bishop's discharging that office. The most remarkable particular concerning this prelate was the tragical manner of his death. For after he had fat near twelve years, the famous rebel Jack Cade and his followers, coming to Edington in Lincolnshire, where the bishop then was, and being joined by several of that prelate's own tenants, fell upon his carriages and plundered them. The next day they assaulted the bishop himself, whilst he was officiating at the altar, and dragged him away to a neighbouring hill, where they barbarously murdered him, by dashing out his brains: then tearing his bloody shirt in pieces, to be preserved in memory of the action; they left his body naked on the place. This massacre happened the 29th of June, 1450.

ASEER, or ASEERGER, a strong fortress of the soubah of Candesh, in the Deccan of Hindoostan, 20 miles N. E. of Barhanpore. Long. 76. o. E. Lat. 31. 35. N.

ASGILL (John), a very humorous writer, was bred to

the law, and practised in Ireland with great success. He was there elected a member of the house of commons, but was expelled for writing a treatise on the possibility of avoiding death; and being afterwards chosen a member for the borough of Bramber in Sussex, he was also on the same account expelled the parliament of England. After this, he continued thirty years a prisoner in the Mint, Fleet, and King's-bench: during which time he published a multitude of small political pamphlets, several of which were in defence of the succession of the house of Hanover, and against the Pretender. He died in the rules of the King's-bench, in the year 1738, when he was upwards of fourscore.

ASHES (*Encycl.*). Some observations concerning the ashes of different kinds of wood, by C. Pissis, M. D. published in the *Annales de Chimie*, are worthy of being annexed to our original article.

"Having burnt a considerable quantity of poplar-wood," says Mr. Pissis, "during the winter of the year 8 (of the French Republic), I observed that the ashes when heated again formed semi vitreous crusts, such as that produced from the ashes of the sea-weed, excepting that they were very thin and small, having been neither agitated, nor exposed to any other heat than that of a moderate chamber fire.

"At first I supposed the cause to be an extraordinary quantity of potash, but as I could not attribute it to the quality of the wood, white woods having always been reckoned to yield a smaller quantity of salt than the others (for example, the aspin (*populus tremula*, Linn.), a tree of the same genus as our poplar (*populus alba*), yields only gros. 45 grs. of potash to the quintal of the wood), I imagined that the circumstance depended upon a change in the ligneous substance. We cultivate poplar for the purpose of procuring props for our vines; and as it is bad fuel, we do not cut it down till it has ceased to produce any more shoots. It is not rare to see poplars, the bark and branches of which appear still to possess a great deal of life, whilst the trunk is reduced to a few handfuls of mould.

"This idea of the augmentation of the potash in rotten wood was not strictly just; but it shall be shewn that it has led me to some conclusions very different from the ideas generally received. I shall revert to all the points of theory, after having related the following facts, which tend to throw a light upon them.

"1. One hundred parts of dry sound poplar wood yielded four parts of ashes.

"2. One hundred parts of dry poplar wood, that was rotten, but not reduced to mould, yielded eight parts of ashes.

"3. One hundred parts of each of these kinds of ashes, lixiviated till the water was drawn off insipid, and perfectly dried in a red heat, lost twenty-eight parts of their weight; the first waters having been very strongly impregnated.

"4. One hundred parts of the same ashes, heated over again, and treated in the same manner as above, lost twenty-two parts; the leys were more strong and caustic than the preceding.

"5. One hundred parts of the ashes of dry and sound oak, when heated over again, and treated as above, lost sixteen parts.

"6. One hundred parts of the wet mould of rotten oak, of the colour of ochre, when placed upon a red hot plate of iron, were very soon dried and incinerated, leaving three parts of ashes, which, even when heated over again, had the colour of iron filings. This is nearly twice as much as the quintal of dry oak has generally yielded! These ashes were perfectly insipid.

"7. One hundred parts of the crusts, of which I have spoken at the beginning of this memoir, when treated in the same manner as the ashes No. 3, lost thirty-seven parts of their weight. This crust at first seems insipid, the potash being as it were in a latent state; but after it has been kept for some time, and triturated, water extracts from it a large quantity of this salt; it is however probable, that some of it still remains in residuum. These leys are extremely caustic.

"8. Some pieces of this crust having been made red-hot, and afterwards extinguished in a small quantity of water, yielded a ley sufficiently caustic to form soap with melted wax and tallow, upon which I poured the cold ley.

"9. This ley, when filtrated through plaster (calcareous sulphate mixed with lime), burnt into powder, lost its alkaline taste, and yielded, by spontaneous evaporation, fine crystals of sulphate of potash.

"From these facts it appears:

"1. From the four first compared with the fifth, that the wood of the white poplar abounds more in salt than that of the oak; so that this is an exception from the maxim generally adopted, that the hard woods contain a greater abundance of potash than the soft.

"The wood of the poplar is of so spongy a texture, that rats cannot gnaw it through, as its fibres resist the impression of their teeth in the same manner as those of hemp; it is also difficult to saw; this quality renders it expensive for articles of furniture, and the more so, as this wood, which is very subject to rot, ought, in order to be fit for sawing, to be cut down whilst in its full vigour, against which there is a great objection, as has been already mentioned.

"This wood burns, when it is dry, with a white flame, emits very little heat, is quickly consumed, and yields no live coal. It is evident that the combustible particles abound more in it than in the other kinds of wood; as is also the case with the willow, which yields twice as much ashes, but only about the same quantity of salt as the oak; that is to say, 15 grammes for one myriagramme of the wood, whilst our poplar yields 72. To what then are we to ascribe this large quantity? this might be determined by analysing its sap: possibly also the acid and viscous fluid of its buds, which is used in pharmacy, might furnish some data towards solving the question.

"According to a calculation made from the returns of the revenue collectors, a myriagramme of aspen wood yields only seven grammes of salt. (Ann. de Chimie, t. xix. p. 178.)

"This difference in the quantity of salt, which is in the proportion of more than ten to one, in two trees of the same genus, will not surprise those who know that the dock and sorrel are of the same genus, and that the four and the bitter cherry are of one and the same species. Nature is not subject to our confined ideas of analogy. It has been laid down as a principle, that plants of the same family may mutually supply the place of each other for medicinal purposes; but prudence requires that we should not act upon this principle, till after having accurately analyzed the two plants which we intend to substitute the one for the other.

"2. From the five first experiments it appears, that rotten wood yields a larger quantity of ashes than sound, frequently more than twice as much. This circumstance is easily accounted for. The wood, whilst it rots, becomes spongy and light: I have seen some rotten wood which did not weigh more than half as much as an equal bulk of the sound wood of the same tree. It burns without flame, like tinder, and it cannot be incinerated but with great difficulty. It appears that the hydrogen has been almost entirely destroyed; and that the carbon, by being sheathed in the earthy particles, escapes the effects of combustion.

"This wood has frequently a phosphorescent quality, the

cause of which still remains to be discovered. We ought not to confound rotten wood with wood that has been eaten by worms. In the latter case, the wood, without losing its colour, is reduced to an impalpable powder, and in that portion of the wood which still retains its solidity we may find the passage which the worm has formed for itself, and frequently the worm itself. One hundred parts of vine-stalks, reduced to an impalpable powder by the worms, and burnt in a red heat, were perfectly incinerated, leaving three parts of ashes, which is nearly the quantity obtained from a quintal of dry vine twigs burnt under the inspection of the revenue officers. This wood, to which the term of worm-eaten peculiarly belongs, has nothing in common with the rotten wood, which is also termed worm-eaten, excepting its appellation, which is very improperly applied to the latter.

"It has been asserted that rotten wood yields little salt; and this assertion is true as far as applied only to wood washed out by the rain, and it is proved by Experiment 8; but Experiment 3 proves that wood which has rotted without being washed out in this manner, has not lost one particle of its potash; and that, as an equal weight of rotten wood yields twice as much ashes of equal quality, it will furnish double the quantity of salt: hence manufactories may derive great advantage, considering the small value which this wood generally bears.

"One might employ, both in the preparation of leys for domestic purposes, and in the manufactories of nitre and salt, the ashes of dead trees, whose summits and bark being still in good preservation have prevented the access of the rain-water to the trunk. The mould of these trees might also be used as an excellent manure, since it retains the whole of its potash. It is further evident, that when this mould is washed by the rain it must be of advantage to the vegetation. The experiments of Citizen Vauquelin have shewn us, that in the sap of trees the potash exists in the state of an acetate: it would be interesting to know also in what state it exists as well in the wood as in the mould of trees.

"3. Experiment 4 shews that by baking the ashes over again they lose one-fifth of their salt: this is a necessary consequence of their losing more and more of their carbonic acid; but at the same time they gain in quality, as is proved by Experiment 8. However, if we bake over again ashes of a very rich quality, like those of our poplar, we shall obtain a half vitrified crust, which will retain a part of the potash; it will further be necessary to triturate this crust, in order to lixiviate it, which will add to the labour of the workmen. This crust, from which salt may be extracted in the proportion of 30 per cent. and which contains still a good deal more in a concealed state, might perhaps be employed in the manufacture of glass equally well with many kinds of soda. This semi-vitreous state of the substance, and the solidity of the soaps obtained in Experiment 8, led me at first to suspect that the ashes of the poplar contained soda; but the Doctor was undeceived by Experiment 9. He made use of some parget, which he had by him for want of sulphuric acid, which was not immediately at hand. Franklin says, it is good to know how to saw with a whimble. For the same reason he made use of wax and tallow."

Dr. Piffis concludes with some ideas to which this experiment gave rise. Melted wax, tallow, and hog's-lard, and heated oils, acquire a temperature higher than that of water, and even of boiling ley: when an alkaline ley is added, the mixture immediately puffs up in an extraordinary manner, the whole of the water is instantly evaporated; and when the ingredients are employed in equal proportions, the soap remains more solid than that made according to the processes usually employed in the manufactories; besides which, it is dry as soon as formed. "These advantages," says Dr. Piffis, "are

well worth the trouble of making some experiments, by which we might examine the following questions :

" 1. If the oil were heated before the water, would not the expansion, which takes place when they are mixed together, occasion some accident ?—To me it appears that it would not, provided the boiler were sufficiently large, and only one-fourth of its capacity filled.

" 2. Might the mixture be stirred ?—It might, after the whole of the ley has been added, as the mixture then remains in a tranquil state of fusion.

" 3. Would the salts which are of no use in forming the soap, particularly the alkaline carbonates, be carried off by the tube ?—I apprehend they would not ; for, in the experiments which I have made on a small scale, no liquid was left behind.

" 4. Would not the only substances, by being too much heated, have their properties so altered as to affect the quality of the soap ?—I fear they would ; for the soaps which I obtained were of a greyish colour."

ASHLEY (Robert), a Wiltshire gentleman, descended from the family of that name residing at Nathill, in that county, was admitted a gentleman-commoner of Hart Hall in Oxford, in the year 1580, being then fifteen years of age. From the university he removed to the Middle Temple, where he was called to the dignity of barrister at law. After some time, he travelled into Holland, France, &c. conversing with the learned, and frequenting the public libraries. Being returned into England, he lived many years in the Middle Temple, and honoured the commonwealth of learning with several of his lucubrations. He died, in a good old age, the beginning of October, 1641. His other works were for the most part translations.

ASHMOLE (Elias), a great antiquary and herald, founder of the Ashmolean museum at Oxford, was born at Lichfield in Staffordshire, 1617. In the early part of his life he practised in the law ; and in the civil war had a captain's commission under the king, and was also comptroller of the ordnance. He married the Lady Mainwaring in 1649, and settled at London ; where his house was frequented by all the learned and ingenious men of the time. Mr. Ashmole was a diligent and curious collector of manuscripts. In the year 1650 he published a treatise written by Dr. Arthur Dee, relating to the philosopher's stone ; together with another tract on the same subject, by an unknown author. About the same time, he was busied in preparing for the press a complete collection of the works of such English chemists as had till then remained in manuscript. This undertaking cost him great labour and expence ; and at length the work appeared, towards the close of the year 1652. He proposed at first to have carried it on to several volumes ; but he afterwards dropped this design, and seemed to take a different turn in his studies. He now applied himself to the study of antiquity and records : he was at great pains to trace the Roman road, which in Antoninus's Itinerary is called *Benueanna*, from Weedon to Lichfield, of which he gave Mr. Dugdale an account in a letter. In 1658 he began to collect materials for his history of the Order of the Garter, which he lived to finish, and thereby did no less honour to the order than to himself. In September following, he made a journey to Oxford, where he set about giving a full and particular description of the coins presented to the public library by Archbishop Laud.

Upon the restoration of King Charles II. Mr. Ashmole was introduced to his Majesty, who received him very graciously ; and on the 18th of June, 1660, bestowed on him the place of Windsor herald. A few days after, he appointed him to give a description of his medals, which were accordingly delivered into his possession, and King Henry VIII.'s closet was assigned

for his use. On the 15th of February, Mr. Ashmole was admitted a fellow of the Royal Society ; and, on the 6th of February following, the king appointed him secretary of Surinam, in the West Indies. On the 19th of July, 1699, the university of Oxford, in consideration of the many favours they had received from Mr. Ashmole, created him doctor of physick by diploma, which was presented to him by Dr. Yates, principal of Brazen Nose College. On the 8th of May, 1672, he presented his "Institution, Laws, and Ceremonies, of the most noble Order of the Garter," to the king ; who received it very graciously, and, as a mark of his approbation, granted him a privy seal for 400l. out of the custom of paper. On the 26th January, 1679, a fire broke out in the Middle Temple, in the next chamber to Mr. Ashmole's, by which he lost a noble library, with a collection of 9000 coins, ancient and modern, and a vast repository of seals, charters, and other antiquities and curiosities ; but his manuscripts and his most valuable gold medals were luckily at his house at Lambeth. In 1683, the university of Oxford having finished a magnificent repository near the theatre, Mr. Ashmole sent thither his curious collection of rarities ; which benefaction was considerably augmented by the addition of his manuscripts and library at his death, which happened at Lambeth, the 18th of May, in the 76th year of his age. He was interred in the church of Great Lambeth in Surrey, on the 26th of May, 1692, and a black marble stone laid over his grave, with a Latin inscription.

Besides the works which we have mentioned, Mr. Ashmole left several which were published since his death, and some which remain still in manuscript.

ASHTED, a village of Surrey, situated near Epfom, on one of the most delightful spots in the county.

ASHTON (Charles), one of the most learned critics of his age, elected master of Jesus College, Cambridge, July 5, 1701, was installed in a prebend of Ely on the 14th of the same month. His great knowledge in ecclesiastical antiquities was excelled by none, and equalled by few ; as his MS. remarks upon the fathers, and corrections of the mistakes of translators, will sufficiently shew. His critical skill in the writers of the classics is well known. Dr. Taylor always spoke with raptures of his correction of the inscription to Jupiter Urius, which he looked on as the happiest thing, and the most to the credit of the doer, and the art itself, that he knew of. He lived to a good old age, but in the latter part of his life seldom appeared abroad.

ASHTON (Thomas), educated at Eton, and elected thence to King's College, Cambridge, 1733, was probably the person to whom Mr. Horace Walpole addressed his Epistle from Florence, in 1740, under the title of Thomas Ashton, esq. tutor to the Earl of Plymouth. He was presented to the rectory of Aldingham in Lancashire, which he resigned in March, 1749 ; and, on the 3d of May following, was presented by the provost and fellows of Eton to the rectory of Sturminster Marshall in Dorsetshire. He was then M. A. and had been chosen a fellow of Eton in December, 1745. In 1752 he was collated to the rectory of St. Botolph, Bishopsgate : in 1759, took the degree of D. D. ; December 10, 1760, he married Miss Amyand ; and in May, 1762, was elected preacher at Lincoln's Inn, which he resigned in 1764. In 1770 he published, in 8vo. a volume of Sermons on several Occasions. Dr. Ashton died March 1, 1775, at the age of fifty-nine, after having for some years survived a severe attack of the palsy. His discourses, admirable as they are in themselves, were rendered still more so by the excellence of his delivery. His other publications were : 1. A Dissertation on 2 Peter i. 19. 1750. 2. A Letter to the Rev. Mr. Thomas Jones. 3. An Extract from the Cafe of the Obligation of the

Electors of Eton College, to supply all Vacancies in that Society with those who are, or have been, Fellows of King's College, Cambridge, so long as Persons properly qualified are to be had within that Description. London, 1771. 4. A Letter to the Rev. Dr. Morell, on the Question of electing Aliens into the vacant Places in Eton College. 5. A Second Letter to Dr. Morell.

ASHTON-UNDER-LINE, a village of Lancashire, seven miles east of Manchester. It has a manufactory of cotton, and an iron foundry, both very considerable.

ASHWELL (George), rector of Hanwell, near Banbury, in Oxfordshire, son of Robert Ashwell, of Harrow on the Hill, Middlesex, was born in London, November 18, 1612. He was admitted a scholar of Wadham College, in Oxford, in 1627, took the degrees in arts, was elected fellow, and became a celebrated tutor in that house. In the time of the grand rebellion he continued in Oxford, and preached several times before the king, court, and parliament. A little before the surrender of the garrison of Oxford, he had the degree of bachelor in divinity conferred on him. About the latter end of the year 1658, he was presented to the living of Hanwell, vacant by the death of Dr. Robert Harris, having been before (as Mr. Wood thinks) chaplain in the family of Sir Anthony Cope, lord of the manor of Hanwell. He had the character of a very peaceable and religious man, and was well versed in logic, the schoolmen, and the fathers. He wrote the following books: 1. A Discourse asserting the received Authors and Authority of the Apostles Creed. Oxon. 1653. 2. A double Appendix, the first touching the Athanasian, the second touching the Nicene Creed. 3. Concerning the Gesture to be used at the receiving of the Sacrament. Oxon. 1668. 4. A Treatise concerning Socinus, and the Socinian Herefy. 5. A Dissertation concerning the Church of Rome. Oxon. 1688. 6. An Answer to Plato Redivivus. 7. He also translated out of Latin into English, Philophus Autodidactus. Our author died at Hanwell, the 8th of February, 1693.

ASHWELL, a village of Hertfordshire, in Doomſday Book called a borough, having 14 burgesses and a mayor. Near the church are the remains of a Roman camp, which consists of 12 acres of land, inclosed by a deep ditch, and formerly a rampart. It is situated near Caldicot, on the borders of Cambridgeshire.

ASINIUS (Pollio), consul and Roman orator, distinguished himself under Augustus by his exploits and his literary works. He is frequently mentioned with praises by Horace and Virgil, and is said to have collected the first library at Rome. He died at Prescati, at 80 years of age.

ASKEATON, a town of Ireland, in the county of Limerick, on the river Shannon. It sends two members to parliament.

ASMONEUS, or ASSAMONEUS, the father of Simon, and chief of the Asmoneans, a family that reigned over the Jews during 126 years.

ASNA (Encycl.). This town in Upper Egypt is believed by some authors to be the ancient Syene, though others say the ruins of it are still to be seen near Assuan. It is so near the cataracts of the Nile, that they may be heard from thence. It contains several monuments of antiquity; and among the rest an ancient Egyptian temple, pretty entire, all painted throughout, except in some places that are effaced by time. The columns are full of hieroglyphic figures. This superb structure is now made use of for a stable, wherein they put oxen, camels, and goats. A little way from thence are the ruins of an ancient nunnery, said to be built by St. Helena, surrounded with tombs. Asna is the principal town in these parts, and the inhabitants are rich in corn and cattle. They drive a considerable trade into Lower Egypt and Nubia, by

means of the Nile, and also by the caravans that pass over the Desert. The inhabitants are all Arabs, except about 200 Copts, the ancient inhabitants, and a sort of Christians. They are under the government of the Turks, who have a cadi, and the Arabs have two sheriffs of their own nation.

ASOPUS, a river of Phrygia Major, which, together with the Lycus, washes Laodicea (Pliny).—Another of Beotia, which running from mount Citheron, and watering the territory of Thebes, separates it from the territory of Plataea, and falls with an east course into the Euripus, at Tanagra. On this river Adraſtus, king of Sicyon, built a temple to Nemeſis, thence called Adraſtea. From this river Thebæ came to be surnamed Aiopides (Strabo). It is now called Aiopo. A third Aiopus, a river of Peloponnesus, which runs by Sicyon (Strabo); and with a north-west course falls into the Sinus Corinthiacus, to the west of Corinth. A fourth, a small river of the Locri Epizeſimidi, on the borders of Thessaly (Pliny); rising in Mount Oeta, and falling into the Sinus Maliacus.

ASOPUS, a town of Laconica (Pausanias); on the Sinus Laconicus, with a port in a peninsula, between Boæ to the east, and the mouth of the Eurotas to the west. The citadel only remains standing, now called by the sailors Caſtel Rampano.

ASPA, a town of Parthia (Ptolemy); now Iſpahan (Hofſtenius). In Ptolemy the latitude seems to agree, being 33°; but whether the longitude does, is a question. E. Long. 51. Lat. 32. 30.

ASPICUETA (Martin de), commonly called the *Doctor of Navarre*, or *Doctor Navarrus*; was descended of a noble family, and born the 13th of December 1491, at Varafayn, a small city of Navarre, not far from Pampeluna. He entered very young into the monastery of Regular canons at Roncevaux, where he took the habit, which he continued to wear after he left the convent. He studied classical learning, natural and moral philosophy, and divinity, at Alcalá, in New Castile, adopting chiefly the system of Petrus Lombardus, commonly called the *Maſter of the Sentences*. He applied to the study of the law at Ferrara, and taught it with applause at Toulouse and Cahors. After being first professor of canon law at Salamanca for fourteen years, he quitted that place to be professor of law at Coimbra, with a larger salary. The duties of this office he discharged for the space of twenty years, and then resigned it to retire into his own country, where he took care of his nieces, the daughters of his deceased brothers. Having made a journey to Rome, to plead the cause of Bartholomeo de Caranza archbishop of Toledo, who had been accused of heresy before the tribunal of the inquisition in Spain, and whose cause was, by the pope's order, to be tried in that city, Aspicueta's writings, which were well known, procured him a most honourable reception. Pope Pius V. made him assistant to Cardinal Francis Aciat, his vice-penitentiary; and Gregory XIII. never passed by his door without calling for him, and stopped sometimes a whole hour to talk with him in the street. His name became so famous, that even in his life-time the highest encomium on a learned man was to call him a *Navarrus*. He was consulted as an oracle. By temperance he prolonged his life to a great length. His economy enabled him to give substantial proofs of his charity. Being very old, he used to ride on a mule through the city, and relieved all the poor he met; to which his mule was so well accustomed, that it stopped of its own accord at the sight of every poor man, till its master had relieved him. He refused several honourable posts in church and state, that he might have leisure to correct and improve the works he had already written, and compose others. He

died at the age of ninety-four, on the 21st of June, 1586. He wrote a vast number of treatises, all which are either on morality or canon law.

ASSAM, a country of Asia, bounded on the W. by Bengal and Bootan, on the N. by the mountains of Thibet, and on the S.E. and S. by Meckley. The river Burrampoote flows through the whole length of it. Its capital is Ghergon. The natives prefer the flesh of dogs to any other kind of animal food. They pay no taxes, the king being the sole proprietor of all the gold, silver, and other metals, found in his kingdom. They live comfortably; almost each housekeeper having an elephant, for the convenience of his wives. The invention of gunpowder is ascribed to the Assamese. It is certain that gunpowder was known in China and Hindoostan, far beyond all periods of investigation; and, in the code of Gentoo laws, is a prohibition of the use of fire-arms. Assam lies between 91° and 96° E. long. and 25° and 28° N. lat.

ASSELYN (John), a famous Dutch painter, was born in Holland, and became the disciple of Jsaiah Vandervele, the battle-painter. He distinguished himself in history-paintings, battles, landscapes, animals, and particularly horses. He travelled into France and Italy; and was so pleased with the manner of Bambocchio, that he always followed it. He painted many pictures at Lyons, where he married the daughter of a merchant of Antwerp, and returned with her to Holland. Here he first discovered to his countrymen a fresh and clear manner of painting landscapes, like Claude Lorraine; upon which, all the painters imitated his style, and reformed the dark brown they had hitherto followed. Asselyn's pictures were so much admired at Amsterdam, that they sold there at a high price. He died in that city, in 1660. Twenty-four pieces of landscapes and ruins, which he painted in Italy, have been engraved by Perelle.

ASSER, John (or ASSERIUS MENEVENSI, that is, *Assir of St. David's*), bishop of Shyrburn in the reign of Alfred the Great. He was born in Pembrokehire, in South Wales; and educated in the monastery of St. David's by the Archbishop Allierius, who, according to Leland, was his kinsman. In this monastery he became a monk, and by his assiduous application soon acquired universal fame as a person of profound learning and great abilities. Alfred, the munificent patron of genius, about the year 880, sent for him to court. The king was then at Dean in Wiltshire. He was so charmed with Asser, that he made him his preceptor and companion. As a reward for his services, he appointed him abbot of two or three different monasteries; and at last promoted him to the episcopal see of Shyrburn, where he died, and was buried, in the year 910. He was, says Pits, a man of a happy genius, wonderful modesty, extensive learning, and great integrity of life. He is said to have been principally instrumental in persuading the king to restore the university of Oxford to its pristine dignity and lustre.—He wrote, *De vita et rebus gestis Alfredi*, &c. Lond. 1574, published by Archbishop Parker, in the old Saxon character, at the end of *Walsingham's hist.*—Francf. 1602, fol. 61x. 1722, 8vo. Many other works are ascribed to this author by Gale, Bale, and Pits; but all doubtful.

ASSHETON (William), doctor of divinity, and rector of Beckenham in Kent, was born in the year 1641, and was educated at Brazen-nose College, Oxford. After entering into orders, he became chaplain to the Duke of Ormond, and was admitted doctor of divinity in 1673. Soon after, he was nominated to a prebend in the church of York, presented to the living of St. Antholin, London, and to the rectory of Beckenham in Kent. He was the first projector of the scheme for providing for clergymen's widows, and others, by a jointure payable out of the mercers' company. He wrote several pieces against the Papists and Dissenters, and some devotional tracts.

He died at Beckenham, in September 1711, in the 70th year of his age.

ASSOS, a seaport town of Natolia, seated on a bay of the Archipelago, twelve miles S.E. of Troas, subject to the Turks. Long. 26. 36. E. Lat. 39. 32. N.

ASSUS, *i*, feminine (Strabo); *Assum*, or *Affon*, *i*, neuter (Ptolemy); a town of Troas (though by others supposed to be of Myfia), and the fame with Apollonia (Pliny); but different from the Apollonia on the river Rhodacus. Ptolemy places it on the sea-coast, but Strabo more inland; if he does not mean the head of an inland bay, as appears from Diodorus Siculus. It was a town of the Leleges, the country of Cleanthes the stoic philosopher, who succeeded Zeno; and is still called *Affos*. E. long. 27. 30. N. lat. 38. 30.

ASSYNT, a district in the western part of Sutherlandshire, in Scotland. It exhibits an assemblage of shattered mountains, heaped, as it were, upon each other; and seemingly torn and convulsed in a truly tremendous manner. Toward the rugged peninsula of Assynt Point, are several vast conic hills, the highest of which is distinguished by the name of the Sugar Loaf.

ASTA, an inland town of Liguria, a colony (Ptolemy); on the river Tanarus; now *Asti*. E. Long. 8. 15. Lat. 44. 40.

ASTA Regia, a town of Betica (Pliny); situated at that mouth of the Bætis, which was choked up with mud, to the north of Cadiz; sixteen miles distant from the port of Cadiz (Antonine). Its ruins shew its former greatness. Its name is Phœnician, denoting a *smith*, or arm of the sea, on which it stood. It is said to be the fame with XERA; which see.

ASTAROTH, the royal residence of Og king of Bashan; whether the fame with Astaroth Carnain, is matter of doubt: if one and the fame, it follows from Eusebius's account, that it lay in Bashan, and to the east of Jordan, because in the confines of Arabia.

ASTARTE, a city on the other side Jordan; one of the names of Rabbath Ammon, in Arabia Patraea (Stephanus).

ASTELL (Mary), the great ornament of her sex, and country, was the daughter of — Astell, an opulent merchant at Newcastle-upon-Tyne, where she was born about the year 1668. She was educated in a manner suitable to her station; and, amongst other accomplishments, was mistress of the French, and had some knowledge of the Latin tongue. Her uncle, a clergyman, observing in her some marks of a promising genius, took her under his tuition, and taught her mathematics, logic, and philosophy. She left the place of her nativity when she was about twenty years of age, and spent the remaining part of her life at London, and at Chelsea. Here she pursued her studies with great assiduity, made great proficiency in the above-mentioned sciences, and acquired a more complete knowledge of many classic authors. Among these Seneca, Epicætus, Hierocles, Antoninus, Tully, Plato, and Xenophon, were her principal favourites.

Her life was spent in writing for the advancement of learning, religion, and virtue; and in the practice of those religious duties which she so zealously and pathetically recommended to others, and in which perhaps no one was ever more sincere and devout. Her sentiments of piety, charity, humility, friendship, and other Christian graces, were uncommonly refined and sublime; and religion sat gracefully upon her, unattended with any forbidding airs of mournfulness or of gloom. Her mind was generally calm and serene; and her conversation was innocently facetious, and highly entertaining. She would say, "The good Christian only hath reason, and he always ought to be cheerful;" and, "That dejected looks and melancholy airs were very unbecomingly in a Christian." But these subjects she hath treated at large in some of her excellent writings.

She was remarkably abstemious; and seemed to enjoy an uninterrupted state of health, till a few years before her death; when, having one of her breasts cut off, it so much impaired her constitution, that she did not long survive it. This painful operation she underwent without discovering the least timidity, or so much as uttering a groan; and shewed the same resolution and resignation during her whole illness. When she was confined to her bed by a gradual decay, and the time of her dissolution drew near, she ordered her shroud and coffin to be made, and brought to her bed-side; and there to remain in her view, as a constant memento of her approaching fate, and to keep her mind fixed on proper contemplation. She died in the year 1731, in the 63d year of her age, and was buried at Chelsea. She wrote, 1. A serious Proposal to the Ladies. 2. An Essay in Defence of the Female Sex. 3. Letters concerning the Love of God. 4. Reflections upon Marriage. 5. Moderation truly stated. 6. The Christian Religion, as professed by a Daughter of the Church of England; and some other works.

ASTIGI, indelible; a colony, and conventus juridicus, of Bætica, furnished *Augytha Firma*, situated on the Singulus, which falls into the Bætis; called also *Colonia Astigitana* (Pliny): now *Eceja*, midway between Seville and Corduba. W. Long. 5. Lat. 37. 20.

ASTLEY (John), was born at Wem in Shropshire, of parents much less showy in their circumstances, but, morally, much more enviable. His father practised medicine. After a little time spent at a country school, which usually does little more than turn ignorance into presumption, John Astley came to London, and was apprenticed to Hudson the portrait painter, who, bad as he was, was the best of his time; and, though otherwise not worth the remembering, will never be forgotten, as the master of Sir Joshua Reynolds. Astley, too, though not so elegantly minded as Reynolds, might have been conspicuous in his art. When he left Hudson, and went to Rome, he shewed such parts as got, and kept, the patronage of Lord Chesterfield. The best pictures he ever painted, were copies of the Bentivoglios, and Titian's Venus, and a head much in the manner of Shakspeare. When he returned from Rome, he was received for several months into the house of a friend, whose abundant kindness he never returned: he then went an adventurer to Ireland; there his fortune was so good, and his use of it so diligent, that in three years he left the country with three thousand pounds more than he brought into it.

As he was painting his way back to London, in his own post-chaise, and with an out-riding, he loitered with a little pardonable vanity, in his native neighbourhood; and entering Knutsford assembly with Major Este, of the 68th, Lady Daniel was at once won by his appearance. She contrived the next day to sit for her portrait, and the next week she gave him the original: superceding the claims of Mr. Smith Barry, Lady Daniel married Mr. Astley. The marriage articles relieved her fortune to herself; but so satisfactory was his behaviour, that the soon gave him the Tably estate; and dying soon after, settled on him, after the death of her eldest daughter, by Sir W. Daniel, the whole Duckenfield estate in fee, amounting together to five thousand pounds a-year.

In the structure and decoration of small buildings, rich as the time is in architecture, Astley's architecture was pre-eminent. Pall-Mall is one instance; Lady Archer's saloon and conservatory at Barnes is another; Duckenfield is yet finer than either. The saloon, the loggio in front, the chamber on each side, and the great octagon, are all as exquisite as original, from their first idea to the last.

Astley's ingenuity led him also to commercial arts; but in this adventure the balance was against him. In the different

sinkings on his colliery, he sunk more money than he raised; in the furnaces for his iron-stone, he consumed more metal from his pocket than the mine.

But in the article of money, his destiny was inexhaustible. The wastes of folly were more than equalled by the wantonness of fortune. His brother, the Putney furgeon, was run over by a waggon at Wimbledon, and breathed his last on the road: this at once, more than replaced the ten thousand pounds he had run down in the furnace. Estimating what he got by painting, by legacies, and by his marriage, he was worth above 100,000l. Of this, about 25,000l. were spent in arts, and elegant accommodations, blameless at least, if not praise-worthy. Thirty thousand pounds, he told Dr. Warren, he had spent on seven years' excesses, when he was languishing under their consequences; and, in the self-disapprobation of a retrospective hour, he declared he would give the remaining 100,000l. to redeem the time he had lost. He died at Duckenfield, November 14, 1787.

ASTON (Sir Arthur), an officer of note in King Charles the First's army, was son of Sir Arthur Aston, of Fulham in Middlesex. He was a great traveller, and made several campaigns in foreign countries. Being returned to England about the beginning of the grand rebellion, with as many soldiers of note as he could bring with him, he took part with the king against the parliament. He commanded the dragoons in the battle of Edge-hill, and with them did his majesty considerable service. The king having a great opinion of his valour and conduct, made him governor of the garrison of Reading in Berkshire, and commissary-general of the horse; in which post he three times repulsed the earl of Essex, who, at the head of the parliament army, laid siege to that place; but Sir Arthur being dangerously wounded, the command devolved on Colonel Richard Fielding, the eldest colonel in the garrison. Sir Arthur was suspected of taking this opportunity to get rid of a dangerous command. Some time after he was appointed governor of the garrison of Oxford, in the room of Sir William Pennynman, deceased. In September following, he had the misfortune to break his leg by a fall from his horse, and was obliged to have it cut off; whereupon, on the 25th of December, he was discharged from his command, which was conferred on Colonel Gage. After the king's death, Sir Arthur was employed in the service of King Charles II. and went with the flower of the English veterans into Ireland, where he was appointed governor of Drogheda. At length Cromwell having taken the town, about the 10th of August, 1649, and put the inhabitants to the sword, Sir Arthur, the governor, was cut to pieces, and his brains beaten out with his wooden leg.

ASTRABAD, a town of Persia, capital of a province of the same name, on the Caspian Sea, 200 miles N. of Ispahan. Long. 55. 35. E. Lat. 36. 50. N.

ASTROP-WELLS, near Banbury in Oxfordshire, much resorted to on account of the virtues of their waters.

ASTYAGES, son of Cyaxares, the last king of the Medes. He dreamed that from the womb of his daughter Mandane, married to Cambyzes king of Persia, there sprang a vine that spread itself over all Asia. She being with child, he resolved to kill the infant as soon as born. Its name was Cyrus; and Harpagus, being sent to destroy it, preserved it: which Astyages after a long time hearing of, he caused Harpagus to eat his own son. Harpagus called in Cyrus, who dethroned his grandfather, and thereby ended the monarchy of the Medes. See MEDIA and PERSIA.

ASTYANAX, the only son of Hector and Andromache: after the taking of Troy, he was thrown from the top of a tower by Ulysses's orders.

ATABYRIS, a very high mountain in the island of Rhodes,

on which, according to Strabo and Diodorus Siculus, there stood a temple of Jupiter Atarabyrius, whose worship a colony of Rhodians carried into Sicily, where a temple was built to the same deity at Agrigentum.

ATACAMA, a harbour of South America, in Peru. There is a great desert of the same name, and a chain of mountains which separate Peru from Quito. On the mountains the cold is so violent, that passengers are sometimes frozen to death. Long. 80. 20. W. Lat. 0. 22. S.

ATALAUA, a town of Portugal, in Estramadura, on an eminence, with a fort, five miles S. of Tomer, and as near the Trajo. Long. 7. 56. W. Lat. 39. 25. N.

ATE (*Encycl.*), the goddess of mischief, was daughter of Jupiter, and cast down from heaven at the birth of Hercules. For Juno having deceived Jupiter, in causing Erisiftheus to be born before Hercules, Jupiter expressed his resentment on Ate, as the author of that mischief; and threw her headlong from heaven to earth, swearing she should never return thither again (*Homeri Il. xix. 125*). The name of this goddess comes from *αταω, noceo, to hurt*. Her being the daughter of Jupiter means, according to mythologists, that no evil happens to us but by the permission of Providence; and her banishment to earth denotes the terrible effects of divine justice among men.

ATENA, a town of Italy, in Naples, near the river Negro twenty-two miles N. of Policastro. Long. 15. 58. E. Lat. 40. 36. N.

ATERNUM, a town of Lucania in Italy; now *Aterni* (*Cluvenus*): also a town in the territory of the Piceni; now *Picra*, a port-town of Naples, situated on the Adriatic. E. long. 15. 25. N. lat. 42. 30.

ATESTE, a town in the territory of Venice in Italy, now called *Elle*. E. long. 12. 6. N. lat. 45. 25.

ATH, a small, handsome, and strong town in Hainault. It was taken by the French in 1745, but restored to the Austrians. It is seated on the Dender, twelve miles N. W. of Mons. Long. 3. 44. E. Lat. 50. 35. N.

ATHANASIA (*Encycl.*), **GOLDBLOCKS**. Of this genus of plants Linnæus mentions eleven species; of which the following fix are, by Mr. Miller, reckoned worthy of a place in those gardens where there are conveniences for preserving tender plants, as none of these species will outlive the winters of this country. 1. The *dentata* grows naturally at the Cape of Good Hope. It rises three or four feet high, sending out many side-branches, garnished with pretty long narrow leaves, having some resemblance to those of buckthorn plantain. The branches are generally terminated by yellow flowers formed into a kind of umbel. These flowers appear early in summer, and the seeds ripen in autumn. 2. The *trifurcata*, is also a native of Africa, as are the three following sorts. It is a shrubby plant, about the height of the former, sending out several weak shoots, garnished with awl-shaped trifid leaves set close to them, of a pale silvery colour. The flowers are yellow, and terminate the branches in a corymbus. They appear in August, and the seeds ripen in October. 3. The *crithmifolia* rises with a strong shrubby stalk to the height of six or eight feet, sending out many ligneous branches garnished with long narrow leaves terminating in four or five parts like those of lampbrush. The flowers are like those of the former, and appear in July and August, being succeeded by seeds which ripen in October. 4. The *pubescens* hath strong woody stalks four or five feet high, covered with a woolly bark, as are also the branches, which are closely garnished with entire, spear-shaped, woolly leaves, and are terminated by yellow flowers having a long foot-stalk, and are sometimes succeeded by seeds that ripen in the autumn. 5. The *annua* is a low annual plant, seldom rising above a foot high, and sending

forth two or three slender branches garnished with wing-pointed leaves: the stalks are terminated by bright yellow flowers growing in umbels, which appear in August and September; but unless the season is very favourable, the seeds do not ripen in this country. 6. The *maritima*, or sea cuedweed, grows naturally on the coasts of the Mediterranean, as also in Wales, and some other parts of Britain; notwithstanding which, Mr. Miller says it must be put under a glass-frame in winter, and rarely perfects good seeds in Britain. It rises two or three feet high, sending out a few weak branches, garnished with white spear-shaped leaves terminated by a single flower upon each foot-stalk. The first four of these sorts may be propagated either by seeds or cuttings; and their culture is not materially different from that of the common hot-bed plants.

ATHANASIUS (St.), bishop of Alexandria, and one of the greatest defenders of the faith against the Arians, was born in Egypt. He followed St. Alexander to the council of Nice, in 325, where he disputed against Arius, and the following year was made bishop of Alexandria; but, in 335, was deposed by the council of Tyre: when, having recourse to the Emperor Constantine, the Arian deputies accused him of having hindered the exportation of corn from Alexandria to Constantinople; on which the emperor, without suffering him to make his defence, banished him to Treves. The emperor, two years after, gave orders that he should be restored to his bishopric: but, on his return to Alexandria, his enemies brought fresh accusations against him, and chose Gregory of Cappadocia to his see; which obliged Athanasius to go to Rome to reclaim it of Pope Julius. He was there declared innocent, in a council held in 342, and in that of Sardica in 347, and two years after was restored to his see by order of the Emperor Constantine: but after the death of that prince, he was again banished by the Emperor Constantius, which obliged him to retire into the deserts. The Arians then elected one George in his room; who being killed in a popular sedition under Julian, in 360, St. Athanasius returned to Alexandria, but was again banished under Julian, and restored to his see under Jovian. He addressed to that emperor a letter, in which he proposed that the Nicene creed should be the standard of the orthodox faith, and condemned those who denied the divinity of the Holy Ghost. He was also banished by Valen in 367, and afterwards recalled. St. Athanasius died on the 2d of May, 373.

His works principally contain a defence of the mystery of the Trinity, and of the incarnation and divinity of the Word and Holy Spirit. There are three editions of his works which are esteemed; that of Commelin, printed in 1600; that of Peter Nannius, in 1627; and that of Father Montfaucon. As to the creed which bears his name, see the church Liturgy.

ATHELNEY, a river-land of Somersetshire, at the confluence of the Thone and Parret, memorable for having afforded shelter, amid its inaccessible morasses, to the illustrious King Alfred. Here he collected some of his retainers; on which account, he called it *Æthelingay*, or the Isle of Nobles; and hence he made frequent and unexpected sallies upon the Danes.

ATHENEUS, a physician, born in Cilicia, contemporary with Pliny, and founder of the pneumatic sect. He taught that the fire, air, water, and earth, are not the true elements, but that their qualities are, *viz.* heat, cold, moisture, and dryness; and to these he added a fifth element, which he called *spirit*, whence his sect had its name.

ATHENEUS, a Greek grammarian, born at Naucratis in Egypt, in the 3d century, one of the most learned men of his time. Of all his works we have none extant but his *Deipnosophias*, i. e. the *Sophists at Table*; there is an infinity of facts

and quotations in this work which render it very agreeable to admirers of antiquity.

There was also a mathematician of this name, who wrote a treatise on mechanics, which is inserted in the works of the ancient mathematicians, printed at Paris in 1693, in folio, in Greek and Latin.

ATHENAGORAS, an Athenian philosopher, flourished about the middle of the 2d century; and was remarkable for his zeal for Christianity, and his great learning, as appears from the apology which he addressed to the emperors Marcus Aurelius Antoninus and Lucius Commodus.

ATHENODORUS, a famous stoic philosopher, born at Tarsus, went to the court of Augustus, and was made by him tutor to Tiberius. Augustus had a great esteem for him, and found him by experience a man of virtue and probity. He used to speak very freely to the emperor. He, before he left the court to return home, warned the emperor not to give himself up to anger, but, whenever he should be in a passion, to rehearse the 24 letters of the alphabet before he resolved to say or do any thing. He did not live to see his bad success in the education of Tiberius.

ATHENOPOLIS, a town of the Massiliensës, an ancient nation of Gaul. It is conjectured by Harduin to be the same with *Telo Martius*, now *Toulon*; by others to be the same with *Antipolis* or *Antibes*.

ATTIGNY, an ancient town of Champagne in France, where several of the kings of France had their residence. It is seated on the river Arne, in E. long. 4. 47. N. lat. 49. 30.

ATKINS (Sir Robert), lord chief-baron of the Exchequer, was born in 1621, and educated at the university of Oxford, from whence he removed to the inns of court, and became eminent in the law. He was made knight of the Bath, with many other persons of the first distinction, at the coronation of King Charles II. In 1672 he was appointed one of the judges of Common Pleas; in which honourable station he continued till 1679, when foreseeing the troubles that soon after ensued, he thought fit to resign, and retire into the country. In 1689 he was made by King William, lord chief-baron of the Exchequer; and about the same time executed the office of speaker to the House of Lords, which had been previously refused by the Marquis of Halifax. He distinguished himself by an unshaken zeal for the laws and liberties of his country. He wrote several pieces, which have been collected into one volume 8vo, under the title of *Parliamentary and Political Tracts*. The authors of the *Biographia Britannica* remark, that whoever inclines to be thoroughly informed of the true constitution of his country, of the grounds and reasons of the revolution, and of the danger of suffering prerogative to justify law, cannot read a better or plainer book than those tracts of Sir Robert Atkins. He died in 1709, aged 88.

ATKINS (Sir Robert), son of the preceding, was born in 1646, and was eminent for all the virtues that could adorn an English gentleman. He wrote the ancient and present state of Gloucester, in one large volume in folio; and died October 29, 1711.

ATKYNs (Richard), was descended from a good family, and was born at Tuffleigh in Gloucestershire, in the year 1615. He was educated at Oxford, from whence he removed to Lincoln's Inn, and afterwards distinguished himself by his loyalty to King Charles I. for whom he raised a troop of horse at his own expence. At the restoration he was made one of the deputy lieutenants of Gloucestershire, and distinguished himself by his attachment to the government. But at length being committed prisoner to the Marshalsea in Southwark for debt, he died there on the 14th of September,

1677. He wrote several pieces, particularly a treatise on the origin of Printing.

ATLAS, king of Mauritania, a great astronomer, contemporary with Moïses. From his taking observations of the stars from a mountain, the poets feigned him to have been turned into a mountain, and to sustain the heavens on his shoulders. Being an excellent astronomer, and the first who taught the doctrine of the sphere, they tell us that his daughters were turned into stars: seven of them forming the Pleiades, and other seven the Hyades.

ATREUS, in fabulous history, the son of Pelops and Hippodamia, and the father of Agamemnon and Menelaus, is supposed to have been king of Mycenæ and Argos about 1228 years before the Christian æra. He drove his brother Thyestes from court, for having a criminal commerce with Ærope his wife: but understanding that he had had two children by her, he sent for him again, and made him eat them; at which horrid action, the sun, it is said, withdrew his light.

ATTENTION, is that state of mind which prepares one to receive impressions. According to the degree of attention, objects make a stronger or weaker impression. Attention is requisite even to the simple act of seeing: the eye can take in a considerable field at one look; but no object in the field is seen distinctly, but that singly which fixes the attention: in a profound reverie that totally occupies the attention, we scarce see what is directly before us. In a train of perceptions, no particular object makes such a figure as it would do singly and a part; for when the attention is divided among many objects, no particular object is entitled to a large share. Hence, the fullness of night contributes to terror, there being nothing to divert the attention:

Horror ubique animos, simul ipsa silentia terrent, *Æneid* ii.

Zara. Silence and solitude are ev'ry-where!
Through all the gloomy ways and iron doors
That hither lead, nor human face nor voice
Is seen or heard. A dreadful din was wont
To grate the sense, when enter'd here, from groans
And howls of slaves condemn'd, from clink of chains,
And crash of rusty bars and creaking hinges;
And ever and anon the sight was dash'd
With frightful faces, and the meagre looks
Of grim and ghastly executioners.
Yet more this fullness terrifies my soul
Than did that scene of complicated horrors.

Mourning Bride, act 5. sc. 8.

In matters of slight importance, attention is mostly directed by will; and for that reason, it is our own fault if trifling objects make any deep impression. Had we power equally to withhold our attention from matters of importance, we might be proof against any deep impression. But our power fails us here: an interesting object seizes and fixes the attention beyond the possibility of control; and while our attention is thus forcibly attached to one object, others may solicit for admittance; but in vain, for they will not be regarded. Thus a small misfortune is scarce felt in presence of a greater:

Lear. Thou think'st 'tis much, that this contentious storm
Invades us to the skin; so 'tis to thee;
But where the greater malady is fix'd,
The lesser is scarce lay. Thou'dst thou a bear;
But if thy flight lay tow'rd the roaring sea,
Thou'dst meet the bear i' the mouth. When the mind's free,
The body's delicate: the tempest in my mind
Doth from my senses take all feeling else,
Save what beats there. *King Lear*, act 3. sc. 5.

ATTERBURY (Lewis), father of the celebrated Dr. Atterbury, bishop of Rochester, was born about the year 1631. He was the son of Francis Atterbury, rector of Middleton-Malfer, or Milton, in Northamptonshire, who, among other ministers, subscribed the Solemn League and Covenant, in 1648. Lewis was entered a student of Christ-church, Oxford, in 1647, took the degree of bachelor of arts on the 23d of February, 1649, and was created master of arts by virtue of a dispensation from Oliver Cromwell the chancellor, March 1, 1651. He was one of those who had submitted to the authority of the visitors appointed by the parliament. In 1654 he became rector of Great or Broad-Ridlington in Gloucestershire; and after the restoration, took a presentation for that benefice under the great seal, and was instituted again to confirm his title to it. On the 11th of September, 1657, he was admitted rector of Milton, or Middleton Keynes, in Bucks; and at the return of Charles II. took the same prudent method to corroborate his title to this living. July 25, 1660, he was made chaplain-extraordinary to Henry duke of Gloucester; and on the 1st of December, in the same year, was created doctor in divinity. Returning from London, whither the law-suits he was frequently involved in had brought him, he had the misfortune to be drowned near his own house, in the beginning of December, 1693.

ATTERBURY (Lewis), eldest son of the preceding, was born at Caldecot, in the parish of Newport-Pagnel, in Bucks, on the 2d day of May, 1656. He was educated at Westminster-school under Dr. Busby, and sent to Christ-church, Oxford, at the age of eighteen. He was ordained deacon in September, 1679, being then bachelor of arts; and priest the year following, when also he commenced master of arts. In 1683 he served the office of chaplain to Sir William Pritchard, lord mayor of London. In February, 1684, he was instituted the rector of Symel in Northamptonshire, which living he afterwards resigned upon his accepting of other preferments. July 8, 1687, he accumulated the degrees of bachelor and doctor of civil-law. In 1691 we find him lecturer of St. Mary Hill in London. Soon after his marriage he settled at Highgate, where he supplied the pulpit of the reverend Mr. Daniel Latham, who was very old and infirm, and had lost his sight: and, upon the death of this gentleman, was, in June 1695, elected by the trustees of Highgate chapel to be their preacher. He had a little before been appointed one of the six preaching chaplains to the Princeess Anne of Denmark, at Whitehall and St. James's, which place he continued to supply after she came to the crown, and likewise during part of the reign of George I. When he first resided at Highgate, observing what difficulties the poor in the neighbourhood underwent for want of a good physician or apothecary, he set himself to the study of physic: and after acquiring considerable skill, practised it gratis occasionally among his poor neighbours. In 1707 the queen presented him to the rectory of Shepperton in Middlesex; and in March 1719 the Bishop of London collated him to the rectory of Hornsey, which was the more agreeable to him, because the chapel of Highgate being situate in that parish, many of his constant hearers became now his parishioners.

In 1720, on a report of the death of Dr. Sprat, archdeacon of Rochester, he applied to his brother, in whose gift this preferment was, to be appointed to succeed him: but the bishop refused.

Dr. Lewis Atterbury died at Bath, whither he went for a paralytic disorder, October 20th, 1731. He published in his life-time two volumes of sermons, and four occasional ones, besides some other pieces. In his will he gave some few books to the libraries of Bedford and Newport, and his whole collection of pamphlets, amounting to upwards of two hundred

volumes, to the library of Christ-church, Oxford. He charged his estate for ever with the payment of ten pounds yearly to a school-mistress to instruct girls at Newport-Pagnel, which salary he had himself in his life-time paid for many years.

ATTICUS (Titus Pomponius), one of the most honourable men of ancient Rome. He understood the art of managing himself with such address, that, without leaving his state of neutrality, he preserved the esteem and affection of all parties. His strict friendship with Cicero did not hinder him from having great intimacy with Hortensius. The contents at Rome between Cinna's party and that of Marius induced him to go to Athens, where he continued for a long time. He was very fond of polite learning, and kept at his house several librarians and readers. He might have obtained the most considerable posts in the government; but chose rather not to meddle, because in the corruption and faction which then prevailed he could not discharge them according to the laws. He wrote Annals. He married his daughter to Agrippa; and attained to the age of 77.

ATILA, king of the Huns, surnamed *the scourge of God*, lived in the 5th century. He may be ranked among the greatest conquerors, since there was scarcely any province in Europe which did not feel the weight of his victorious arms. See **HUNS**.

ATTOCK, a city and fortress of Hindoostan Proper, on the E. bank of the Indus; supposed to stand on the site of the Taxila of Alexander, where he crossed that river. It was built by the Emperor Achar, in 1581; and is 180 miles N.W. of Lahore. Long. 70. 36. E. Lat. 32. 27. N.

ATTOCK, a river, which rises in the Tartarian mountains, N. of Hindoostan, and passing by Cabul, flows into the Indus, above Attack.

ATURE, an ancient town in the district of Novempopulana in Aquitania, on the river Aturus; now Aire in Gascony, on the Adour. E. long. o. 3. N. lat. 43. 40.

AVA, a large river of Asia, which rises in Thibet, and crossing the kingdoms of Burmah and Pegu, falls into the bay of Bengal, by several mouths.

AVA (Encycl.), a kingdom Asia, in the peninsula beyond the Ganges. The king is very powerful, his dominions being bounded by Mogulistan on the west, Siam on the south, Tonquin and Cochinchina on the east, and by Tibet and China on the north. Several large rivers run through this country, which annually overflow their banks like the Nile, and thus render it extremely fertile. Here are mines of lead and copper, together with some of gold and silver, besides large quantities of the finest oriental rubies, sapphires, emeralds, &c.

AVA, the metropolis of the kingdom of the same name, is situated in E. long. 66. 30. N. lat. 21. 0. It is pretty large; the houses built with timber or bamboo canes, with thatched roofs, and floors made of teak plank or split bamboo. The streets are very straight, with rows of trees planted on each side. The king's palace is an exact quadrangle, each side of which is 800 paces, and is surrounded with a brick wall; but the palace itself is of stone. It has four gates; the golden gate, through which all ambassadors enter; the gate of justice, through which the people bring petitions, accusations, or complaints; the gate of grace, through which those pass who have received any favours, or have been acquitted of crimes laid to their charge; and the gate of state, through which his majesty himself passes when he shews himself to the people.

AVARICUM, an ancient town of the Bituriges in Gallia Celtica, situated on the rivulet Avara, in a very fertile soil (Cæsar). Now Bourges in Berry. E. long. 2. 30. N. lat. 47. 10.

AUBE, a department of France, containing part of the

late province of Champagne. It takes its name from a considerable river, which passing by Bar-sur-Aube, and Arcis falls into the Seine near Nogent.

AUBIGNE (Theodore Agrippa d'), a very illustrious Frenchman, and grandfather of the no less illustrious madam de Maintenon, was born about the year 1550. His parts were so uncommon, and his progress in letters so very rapid, that he is said to have translated the "Crito" of Plato from the Greek into French, when no more than eight years old. His father dying when he was thirteen, and leaving him nothing but with his name and his debts, he attached himself to the person and cause of King Henry IV. imagining that his sword would provide for him better than his pen. Henry made him gentleman of his bedchamber, and raised him successively to several high offices and commands; and Aubigné was absolutely a favourite with him: but he lost at length his favour, partly by refusing to comply with the passions of his master, but chiefly by a certain hardness and inflexibility of temper, which is not agreeable to any body, but is particularly disgusting to kings, and all who think that some homage is due to superiority of station. He quitted therefore the court of Henry, and afterwards the kingdom, and took refuge at Geneva, where he met with the most welcome reception, and was distinguished with the highest honours. Here he spent a good portion of his time in writing, and is the author of several productions. His principal work is *Histoire Universelle*, from 1550 to 1601, with a short account of the death of Henry IV. in three volumes folio. The first volume was scarcely published, when the parliament of Paris caused it to be burnt, as a production wherein kings are not only treated with little respect, but sometimes outraged. Aubigné died at Geneva in 1630, aged eighty.

AUBIN, a town of the island of Jersey. It has a good harbour defended by a fort.

AUCKLAND, BISHOP'S, a town in the bishopric of Durham, with a market on Thursday. It is pleasantly seated on the side of a hill, and noted for its castle, beautifully repaired about one hundred years ago; for its chapel, whose architecture is very curious; and for its bridge. It is eight miles S. by W. of Durham, and 25½ N.N.W. of London. - Long. 1. 31. W. Lat. 54. 43. N.

AUDE, a department of France, part of the late province of Languedoc. It receives its name from a river, which rises in the Pyrenées, and flowing by Quillan and Limoux, falls into the Mediterranean below Narbonne.

AUDEUS, the chief of the Audéans, obtained the name of an heretic, and the punishment of banishment, for celebrating Easter in the manner of the Jews, and attributing an human form to the Deity. He died in the country of the Goths, about the year 370.

AUDLEY (James), Lord Audley, of Heleigh, in the county of Stafford, was born about the year 1314, being the 7th of Edward II. By the special favour of Edward III. he had livery of all the lands of his inheritance, in the third year of that prince's reign, though he was not then of full age. This prince soon after did him a great favour: Roger Mortimer, earl of March, who was this lord's guardian, had in his minority exacted from him a recognizance for ten thousand marks, which debt, on the attainer of Mortimer, becoming due to the king, he totally discharged Lord Audley therefrom. In 1343 the same prince made him governor of Berwick-upon-Tweed, and the two next years he served in France. In 1348 he was elected into the noble order of the Garter, then first founded, and in 1353 he reduced a great part of the country of Valois. In 1356, and thirtieth of Edward III. he was present at the famous battle of Poitiers; where, having

demanding of the Black Prince leave to charge in the front, it was, on account of a vow he had made, given him. There, with four esquires who attended him, he performed such extraordinary feats of arms, as distinguished him from all the gallant noblemen who that day engaged. At length, however, he was so grievously wounded, that his esquires were constrained to bear him out of the field of battle. In 1390 he attended King Edward III. and his three sons, in their wars in France; and in the year following, swore to the peace then concluded in the name of King Edward. For these services he was appointed constable of the castle of Gloucester for life; and was also governor of Aquitain, and seneschal of Poitou. He died April 1, 1386.

AUDLEY (Edmund), son of James lord Audley, was educated in Lincoln College, in Oxford, and in the year 1463 took the degree of bachelor of arts in that university. In 1471 he became prebendary of Farendon, in the church of Lincoln; and in October 1475 attained the like preferment in the church of Wells. On Christmas-day, the same year, he became archdeacon of the East Riding of Yorkshire, and had other considerable preferments. These preferments he quitted, on his being promoted to the bishopric of Rochester, in 1480, being the twentieth of Edward IV. in which see he succeeded John Russell, who was translated into Lincoln, and who was tutor to Edward prince of Wales. In 1492, being the eighth of Henry VII. our Bishop Audley was translated to Hereford, and thence, in 1502, being the eighteenth of the same king, to Salisbury, and about that time was made chancellor of the most noble order of the Garter. He was a man of learning, and of a generous spirit. In 1518, he gave four hundred pounds to Lincoln College, to purchase lands; and bestowed upon the same house the patronage of a chantry, which he had founded in the cathedral church of Salisbury. He was a benefactor, likewise, to St. Mary's church, in Oxford. He died August 23, 1524.

AUDLEY (Sir Thomas), was descended of an ancient and honourable family in Essex, and born in 1488. He had the advantage of an university education, and afterwards studied the law in one of the inns of court. In 1526 he was autumn-reader of the Inner-Temple. On the recommendation of the Duke of Suffolk, the king took notice of him, and finding him to be a man of great parts and good address, procured him to be chosen speaker of that parliament which met on the 3d of November, 1529. Audley's conduct on this station, fully answered the king's expectations. The next year he was made attorney of the duchy of Lancaster; and May 20, 1532, upon the resignation of Sir Thomas More, the king delivered to him the great seal, with the title of lord-keeper, and at the same time conferred on him the honour of knighthood. In January following the king appointed him lord-chancellor; and soon after granted him the site of the priory of Christ-church, near Aldgate, now called Duke's-Place, with all the church plate and lands belonging to that house. In this high office he was as diligent in the king's business, as he had been when speaker of the House of Commons; for in July 1535 he sat in judgment, and pronounced sentence of death, upon Sir Thomas More, indicted of high treason, for refusing to acknowledge the king's supremacy in the church. When sentence was past, Sir Thomas said, that he had for seven years bent his mind and study upon this cause, but as yet he found it no where writ, by any approved doctor of the church, that a layman could be head of the ecclesiastical state. To which Audley returned, "Sir, will you be reckoned wiser, or of a better conscience, than all the bishops, the nobility, and the whole kingdom?"

On the 20th of November, 1538, he was created Baron Audley, of Walden in Essex, and installed knight of the Garter. A little before his death, he obtained from the king a licence to change the name of Buckingham College, in Cambridge, into that of Magdalen, or Maudlin. To this college he was a great benefactor, bestowed on it his own arms, and is generally reputed its founder. He died on the last of April, 1544, having held the seals upwards of twelve years, and in the fifty-sixth year of his life.

AVEIRON, a department of France, including the late province of Rouergue. It is named from a river, which rises near Séverac-le-Château, and flowing by Rhodéz and Villefranche, falls into the Garonne, below Montauban.

AVELLINO, a city in Italy, in the kingdom of Naples, with a bishop's see. It was almost ruined by an earthquake in 1694. E. long. 15. 13. N. lat. 40. 53.

AVENACEOUS, something belonging to or partaking of the nature of oats.

AVENIO, an ancient town of the Cavares, and one of the most opulent in Gallia Narbonensis; now *Avignon*, in Provence. See **AVIGNON**.

AVENTINE (John), author of the annals of Bavaria, was born of mean parentage, in the year 1466, at Abensperg, in the country just named. He studied first at Ingolstadt, and afterwards in the university of Paris. In 1503 he privately taught eloquence and poetry at Vienna; and in 1507 he publicly taught Greek at Cracow in Poland. In 1509 he read lectures on some of Cicero's pieces at Ingolstadt; and in 1512 was appointed to be preceptor to Prince Lewis and Prince Ernest, sons of Albert the Wise, duke of Bavaria; and travelled with the latter of those two princes. After this he undertook to write the annals of Bavaria, being encouraged by the dukes of that name, who settled a pension upon him, and gave him hopes that they would defray the charges of the book. This work, which gained its author great reputation, was first published in 1554, by Jerome Zieglerus, professor of poetry in the university of Ingolstadt; and afterwards at Basil in 1580, by Nicholas Cfiner. An affront which Aventine received in the year 1529, flung by him all the rest of his life: he was forcibly taken out of his sister's house at Abensperg, and hurried to a gaol; the true cause of which violence was never known: but it would probably have been carried to a much greater length, had not the Duke of Bavaria interposed, and taken this learned man into his protection. Mr. Bayle remarks, that the incurable melancholy which from this time possessed Aventine, was so far from determining him to lead a life of celibacy, as he had done till he was 64, that it induced him perhaps to think of marrying. The violence of his new passion was not however so great, but that it suffered him to advise with two of his friends, and consult certain passages of the bible relating to marriage. The result was, that it was best for him to marry; and having already lost too much time, considering his age, he took the first woman he met with, who happened to be his own maid, ill-tempered, ugly, and extremely poor. He died the 9th of January, 1534, aged 68; leaving one daughter, who was then but two months old. He had a son, who died before.

AVERNO (*Encycl.*), also called **AVERNUS**. See **AVERNUS**.
AVERRHOA (*Encycl.*). Correct an obvious botanical mistake in that article; the *clasi* being put for the *order*, and vice versa.

AVERROES, an Arabian philosopher, was a native of Corduba, and flourished in the twelfth century. He was instructed in the laws and the religion of the country by his father, who was high priest and chief judge (under the emperor

of Morocco) of the kingdom of Corduba, his authority extending over all Andalusia and Valencia. Averroes was professor in the university of Morocco, and after the death of his father succeeded to his places, the duties whereof he discharged with great approbation, being eminently skilled in law and divinity. He had also studied natural philosophy, medicine, astrology, and mathematics; but understood the theory of medicine much better than the practice. The king of Morocco making him an offer of the place of judge of Morocco and Mauritania, with leave to keep those he held at Corduba, he accepted it, went over to Morocco, and having settled judges as his subdelegates, returned to Corduba.

He referred all criminal causes to his deputy, never giving his own opinion. One Abraham Ibnu Sahal, a philosopher, physician, and astrologer, at Corduba, in an unlucky hour fell in love, and began to write verses, without any regard to his character as a doctor. The Jews, his brethren in religion, advising him not to publish them, he returned them a profane answer in verse. This obliged them to apply to the civil magistrate. They represented to Averroes, that Sahal had debauched the whole city, and especially the youth of both sexes, by his poems; and that nothing else was sung at the marriage feasts. Averroes forbade him to write any more, under a penalty; but being afterwards informed that his prohibition could not stop the poetical humour of the Jew, he resolved to be assured of the truth of it, and sent to him a trusty person, who reported at his return, that he found nobody at his house but Averroes's eldest son, writing verses; and that there was neither man, woman, nor child, at Corduba, who had not got by heart Abraham Ibnu Sahal's verses. Upon this Averroes dropped the prosecution, saying, "Can one single hand stop a thousand mouths?"

Surprising things are related of his patience, liberality, and meekness. Once, when he was reading a lecture in the civil law, the servant of one of his enemies came and whispered something in his ear: Averroes changed countenance, and answered only, "Yes, yes." The next day the same servant returned, and publicly asked pardon, confessing that he had said a rude thing to Averroes the day before, when he whispered him in the ear. "God bless you," replied Averroes, "for declaring that I am endued with patience." He gave him afterwards a sum of money, and bid him not to do to others as he had done to him. Though Averroes was rich both by marriage and his posts, he was always in debt, because he was very liberal to men of letters in necessity, whether they were his friends or enemies. He would not consent to his youngest son's accepting of the honours offered him at the court of Morocco; and was so far from shewing any peculiar satisfaction at the deference paid to this young man, which was intended to do a pleasure to his father, that he was absolutely uneasy at it. He explained Aristotle's doctrine of the unity of the intellect in such a manner, as to overturn the immortality of the soul, and consequently future rewards and punishments. Observing the people to eat the sacrament they had just worshipped, "Let my soul," said he, "be with those of the philosophers, since the Christians worship what they eat." His good qualities did not hinder him from having a great many enemies among the nobility and doctors of Corduba; who representing to Manzor king of Morocco that the philosophical tenets he had maintained in a lecture to his pupils were gross heresy, that prince fell into a passion, ordered his estate to be confiscated, and confined him to the Jews' quarter. After this, Averroes being pelted with stones by the children as he went to mosque to perform his devotions, removed from Corduba to Fez, and lay concealed there for some days; but being discovered, was sent to gaol. Manzor assembled a great many doctors in divinity and law, to consider what punishment he deserved.

The greatest part of them replied, that as an heretic, he merited capital punishment; but others were of opinion, that a man of his eminence ought not to be put to death, but be obliged to retract. Manfor approving of this advice, our philosopher was conducted, one Friday, at the hour of prayer, to the gate of the mosque, and placed bare-headed upon the highest step, and all who entered into the mosque spat in his face. Prayers being ended, the doctors, with notaries, and the judge with his assessors, came thither, and asked this unhappy man, whether he repented of his heresy? He answered, "Yes!" upon which he was discharged. He staid at Fez, and read lectures in law. Some time after, Manfor gave him leave to return to Corduba, where he lived very unhappily, being deprived of his estate and books. In the mean time, the judge who had succeeded him, behaved in such a manner, and justice was so badly administered, that the people groaned under heavy oppression: wherefore Manfor assembled his council, and propoed the restoring of Averroes. This motion being approved of by the majority, Averroes was brought back to Morocco, and invested with his former office. Being asked in what situation his mind was whilst under prosecution, "I was pleased," said he, "and displeased. I was glad to be discharged from the troublesome office of a judge, but I was uneasy to be oppressed by false witnesses. I did not wish to be restored to my post as a magistrate, and have not accepted it again till my innocence has been made to appear."

He died at Morocco in 1206. He was excessively fat, though he ate but once a day. He spent all his nights in the study of philosophy; and when he was fatigued, amused himself with reading poetry or history. Of Averroes's medicinal works himself gives the following account in the preface to them: "At the desire of the noble lord Audelach Sempfe, who by the advice of his philosophers, Avofait and Avenchlit, enjoined me to write a book in Arabic, which should contain the whole art of physic, in order to assist them in forming a judgment of the opinions of the ancients, I compiled this work Colliget, that is, Universal; so entitled on account of the order to be observed in this science, which descends from universals to particulars: for in this book I have begun with general rules, and hereafter, with God's assistance, shall undertake another treatise upon particulars," &c. He wrote a great many amorous verses, but when he grew old he cast them into the fire. His other poems are all lost, except a small piece, in which he declares that when he was young he acted against his reason, but that when he was in years he followed the dictates of it: upon which he utters this wish; "Would to God I had been born old, and that in my youth I had been in a state of perfection."

AVESBURY (Robert), an English historian, of whom little more is known, than that he was keeper of the registry of the Court of Canterbury in the reign of Edward III. and consequently that he lived in the 14th century. He wrote *Memorabilia gesta magnifici regis Anglie domini Edwardi tertii post conquestum, procerumque; tactis primitus quibusdam gestis de tempore patris sui domini Edwardi secundi, quo in regnis Anglie, Scotie, et Francie, ac in Aquitania et Britannia, non humana sed Dei potentia, contigerunt, per Robertum de Avesbury*. This history ends with the battle of Poitiers, about the year 1356. It continued in manuscript till the year 1720, when it was printed by the industrious Thomas Hearne, at Oxford, from a manuscript belonging to Sir Thomas Seabright. It is now become very scarce.

AUGUSTA *Ausciorum*, a town of Aquitania, so named out of compliment to Augustus, being originally called *Climberium*, which name it afterwards resumed. In the middle age, it took the name of the people, *Ausii*; and is now called *Auch*, the capital of Gascony.

AUGUSTA *Emerita*, a town of Lusitania on the river Anas, the capital of the province; a colony of the Emeriti, or such soldiers as had served out their legal time, were men of experience, or had received marks of favour. The colony was founded by Augustus; and is now called *Merida*, a city of Spain, in Estremadura, on the river Guadiana. See *MERIDAN*.

AUGUSTA *Prætoria*, a town and colony of Gallia Cisalpina, and capital of the Salassi; seated at the foot of the Alps Graia on the Duria. Now *Aoste* in Piedmont. See *AOSTE*.

AUGUSTA *Rauracorum*, a town of Gallia Belgica: now a small village called *Auguß*, at the bend of the Rhine northwards, but from the ruins, which are still to be seen, appears to have been a considerable colony, at the distance of six miles from Basil to the East.

AUGUSTA *Suessonum*, a town of Gallia Belgica on the Aroqa; so called from Augustus, and with great probability supposed to be the Noviodunum Suessonum of Caesar.—Now *Soissons*, on the river Aisne, in the Isle of France. See *SOISSONS*.

AUGUSTA *Taurinorum*, a town of the Taurini, at the foot of the Alps, where the Duria Minor falls into the Po; now *Turin*, the capital of Piedmont.

AUGUSTA *Treba*, a town of the Æqui, near the springs of the river Anio, in Italy; now *Trevi* in Umbria, or in the east of the Campagna di Roma.

AUGUSTA *Treverorum*, a town of the Treviri, a people inhabiting between the Rhine and the Meuse, but especially about the Moselle; now *Triers*, or *Treves*, in the circle of the Lower Rhine on the Moselle.

AUGUSTA *Vindelicorum*, a town of the Licates on the Licus; called by Tacitus a noble colony of *Rætia*; now *Augßburg*, the capital of Suabia.

AUGUSTIN, or AUSTIN (St.), the first archbishop of Canterbury, was originally a monk in the convent of St. Andrew, at Rome, and educated under St. Gregory, afterwards Pope Gregory I. by whom he was dispatched into Britain with 40 other monks of the same order, about the year 596, to convert the English Saxons to Christianity.—They landed in the Isle of Thanet; and having sent some French interpreters to King Ethelbert, with an account of their errand, the king gave them leave to convert as many of his subjects as they could, and assigned their place of residence at Dorovernum, since called *Canterbury*; to which they were confined till the king himself was converted, whose example had a powerful influence in promoting the conversion of his subjects; but though he was extremely pleased at their becoming Christians, he never attempted to compel them. He dispatched a priest and a monk to Rome, to acquaint the pope with the success of his mission, and to desire his resolution of certain questions. These men brought back with them a pall, and several books, vestments, utensils, and ornaments for the churches. His holiness, by the same messengers, gave Augustin directions concerning the settling of episcopal sees in Britain; and ordered him not to pull down the idol-temples, but to convert them into Christian churches; only destroying the idols, and sprinkling the place with holy water, that the natives, by frequenting the temples they had been always accustomed to, might be the less shocked at their entrance into Christianity. Augustin resided principally at Canterbury, which thus became the metropolitan church of England; and having established bishops in several of the cities, he died on the 26th of May, 607. The Popish writers ascribe several miracles to him. The observation of the festival of St. Augustin was first enjoined in a synod held under Cuthbert archbishop of Canterbury, and afterwards by the pope's bull, in the reign of King Edward III.

AUGUSTINE (St.), an illustrious father of the church, was born at Thagaste, a city of Numidia, on the 13th of November, 354. His father, a bourgeois of that city, was called *Patricius*; and his mother *Monica*, who, being a woman of great virtue, instructed him in the principles of the Christian religion. In his early youth he was in the rank of the catechumens; and falling dangerously ill, earnestly desired to be baptized; but the violence of the distemper ceasing, his baptism was delayed. His father, who was not yet baptized, made him study at Thagaste, Madaura, and afterwards at Carthage. Augustine, having read Cicero's books of philosophy, began to entertain a love for wisdom, and applied himself to the study of the holy scriptures; nevertheless, he suffered himself to be seduced by the Manicheans. At the age of 19, he returned to Thagaste, and taught grammar, and also frequented the bar: he afterwards taught rhetoric at Carthage with applause. The insolence of the scholars at Carthage made him take a resolution to go to Rome, though against his mother's will. Here also he had many scholars; but disliking them, he quitted Rome, and settled at Milan, and was chosen public professor of rhetoric in that city. Here he had opportunities of hearing the sermons of St. Ambrose, which, together with the study of St. Paul's epistles, and the conversion of two of his friends, determined him to retract his errors, and quit the sect of the Manicheans: this was in the 32d year of his age. In the vacation of the year 386 he retired to the house of a friend of his, named *Perecundus*, where he seriously applied himself to the study of the Christian religion, in order to prepare himself for baptism, which he received at Easter, in the year 387. Soon after this, his mother came to see him at Milan, and invite him back to Carthage; but at Ostia, whither he went to embark in order to his return, he died. He arrived in Africa about the end of the year 388; and having obtained a garden-plot without the walls of the city of Hippo, he associated himself with eleven other persons of eminent sanctity, who distinguished themselves by wearing girdles, and lived there in a monastic way for the space of three years, exercising themselves in fasting, prayer, study, and meditation, day and night: from hence sprung up the Augustine friars, or eremites of St. Augustine, being the first order of mendicants; those of St. Jerome, the Carmelites, and others, being but branches of this of St. Augustine.—About this time, or before, Valerius bishop of Hippo, against his will, ordained him priest: nevertheless, he continued to reside in his little monastery, with his brethren, who, renouncing all property, possessed their goods in common. Valerius, who had appointed St. Augustine to preach in his place, allowed him to do it in his presence, contrary to the custom of the churches in Africa. He explained the creed, in a general council of Africa, held in 393. Two years after, Valerius, fearing he might be preferred to be bishop of another church, appointed him his coadjutor or colleague, and caused him to be ordained bishop of Hippo, by Megalus bishop of Calame, then primate of Numidia. St. Augustine died the 28th day of August, 430, aged 76 years, having had the misfortune to see his country invaded by the Vandals, and the city where he was bishop besieged for seven months.

The works of St. Augustine make ten volumes; the best edition of them is that of Maurin, printed at Antwerp, in 1700. They are but little read at this time, except by the clergy of the Greek church, and in the Spanish universities. The booksellers of London receive frequent commissions for them, and indeed for the most of the fathers, from Russia, and also from Spain.

AUGUSTOBONA, a city of the Tricassers in ancient

Gaul, from whom it was afterwards called *Tricassus*, and *Treccia*; and still farther corrupted to *Trace*, or *Treti*; whence the modern name *Troyes*, in Champagne on the Seyne. See *Troyes*.

AUGUSTODUNUM, the capital of the *Ædui*, where there was a famous academy or school for the education of youth; now *Aulun*, or *Aulun*, in the duchy of Burgundy, on the Arroux. See *Aulun*.

AUGUSTOMAGUS, an ancient town of Gallia Belgica; now *Sentis* in the Isle of France. E. long. 2. 30. N. lat. 49. 10.

AUGUSTUS (Cains Julius Cæsar Octavianus), the nephew of Julius Cæsar, was born at Rome 63 years before Jesus Christ. When he understood that his uncle had adopted him for his heir, he went to Italy and attached himself to his party. He quarrelled with M. Antonius; but afterwards entering into a treaty with him and Lepidus, these three formed the second triumvirate, agreed to a proscription of their respective enemies, and divided the empire among them. Lepidus being abandoned by his army, was sent into exile; and Antonius being reduced to destroy himself, Octavius assumed the title of Emperor, and the appellation of *Augustus*. He was cruel in his triumvirate, but seemed to have adopted new virtues with his imperial dignity; since he now appeared just, affable, moderate, and liberal: he maintained peace; advanced men of merit; and patronised arts and sciences, which under his reign were brought to the greatest perfection. He died at the age of 75. See *Rome*.

AVICENNA, a celebrated philosopher and physician among the Mohammedans, was born in the year 980. By the time he was ten years old, he had learned the Koran, and made a great progress in classical literature. He was next sent to a man who dealt in herbs, and was skilled in the Indian method of accounts, to learn arithmetic. After this, the rudiments of logic and the first five or six propositions of Euclid were explained to him by a private tutor. He went through the rest of Euclid by himself, consulting the commentaries; when he entered on the *Almagest*, his tutor left him. He next applied himself to the study of physic, and to gain experience, visited patients, being then about sixteen. The following year and a half he employed with incredible application in reading; and when any difficulty occurred, he had recourse to Heaven. Having attained to a perfect knowledge of logic, natural philosophy, and mathematics, he proceeded to divinity, and as a proper preparation for this study, he was desirous to make himself master of Aristotle's *Metaphysics*; but having read the book over forty times, and even got it by heart, without being able to comprehend the author's meaning, he laid it by as unintelligible.—One day whilst he was in a bookseller's shop, a broker offered him a book of metaphysics to sell, which he rejected with scorn, saying it was an useless science: the broker, however, telling him he might have it cheap, the owner being under the necessity of selling it, he purchased it. The book proved to be a treatise of Al Farabius, "concerning the objects of metaphysics;" which Avicenna had no sooner run over, than he plainly perceived the sense of Aristotle, whose words he retained in his memory, and out of joy gave a considerable alms to the poor. Having recovered the King of Khorasan, who during a fit of illness had sent for Avicenna, though a very young man, that prince kept him near his person, and allowed him free access to his large and valuable library; which happening to be burnt soon after, Avicenna's enemies accused him of having set it on fire, that nobody else might enjoy the same advantage, and that what he had learned there might be taken for his own.

A very remarkable story is told of Avicenna's sagacity. When he was at Jorgân Kabûs, the sovereign of the country sent for him to visit his nephew, who was confined to his bed by a disorder, which baffled all the physicians of that country. Avicenna, having felt the young man's pulse and seen his urine, judged his illness to proceed from concealed love. He sent for the chief eunuch of the palace, and whilst he kept his finger on the patient's pulse, desired him to call over the names of the several apartments: observing great emotions in the sick man at the naming of one particular apartment, he made the eunuch name all the women in that apartment; and finding his patient's pulse to beat extremely high at the mention of one person, he no longer doubted but that she was the object of his passion, and declared that his cure was only to be expected from the enjoyment of that lady. Avicenna died in the year 1036. He had a good constitution, which he greatly impaired by a too free use of women and wine. The number of his books, including his smaller tracts, is computed at near 100, the greatest part of which is either lost, or not known in Europe.

AVILES, a town of Spain, in the principality of Asturias, on the bay of Biscay, 25 miles N. of Oviedo. Long. 6. 5. W. Lat. 43. 27. N.

AVISON (Charles), organist of Newcastle, and a disciple of Geminiani, was the author of an essay on musical expression, published in the year 1752, in which are some judicious reflections on music in general, but his division of the modern authors into classes is rather fanciful than just. Throughout his book he celebrates Marcello and Geminiani; the latter frequently in prejudice to Mr. Handel. In the year 1753 came out remarks on Mr. Avison's essay on musical expression, the author whereof first points out sundry errors against the rules of composition in the works of Avison. In the same year Avison republished his essay, with a reply to the author of the remarks; and a letter, containing a number of loose particulars relating to music collected in a course of various reading, unquestionably written by Dr. Jortin. Avison promoted and assisted in the publication of Marcello's music to the psalms adapted to English words. Of his own composition there are extant five collections of concertos for violins, forty-four in number; and two sets of sonatas for the harpsichord and two violins, a species of composition little known in England till his time. The music of Avison is light and elegant, but it wants originality; a necessary consequence of his too close attachment to the style of Geminiani, which in a few particulars only he was able to imitate. *Hawkins's Hist. of Music.*

AUNGRVYLE (Richard), commonly known by the name of *Richard de Bury*, was born in 1281, at St. Edmund's Bury, in Suffolk, and educated at the university of Oxford. —After this he entered into the order of Benedictine monks, and became tutor to Edward prince of Wales, afterwards King Edward III. Upon the accession of his royal pupil to the throne he was appointed cofferer, then treasurer of the wardrobe, archdeacon of Northampton, prebendary of Lincoln, Sarum, and Litchfield, keeper of the privy seal, dean of Wells, and last of all was promoted to the bishopric of Durham. He likewise enjoyed the offices of lord high-chancellor, and treasurer of England; and discharged two important embassies at the court of France. Learned himself, and a patron of the learned, he maintained a correspondence with some of the greatest geniuses of the age, particularly with the celebrated Italian poet Petrarch. He was also of a most humane and benevolent temper, and performed many signal acts of charity. Every week he made eight quarters of wheat into bread, and gave it to the

poor. Whenever he travelled between Durham and Newcastle, he distributed eight pounds sterling in alms; between Durham and Stockton, five pounds; between Durham and Auckland, five marks; and between Durham and Middleham, five pounds. He founded a public library at Oxford, for the use of the students, which he furnished with the best collection of books then in England; and appointed five keepers, to whom he granted yearly salaries. At the dissolution of religious houses in the reign of Henry VIII. Durham College, where he fixed the library, being dissolved among the rest, some of the books were removed to the public library, some to Balliol College, and some came into the hands of Dr. George Owen, a physician of Godslow, who bought that college of King Edward VI. Bishop Aungervyle died at his manor of Auckland, April 24, 1545, and was buried in the fourth part of the cross aisle of the cathedral church of Durham, to which he had been a benefactor. He wrote, 1. *Philobiblos*, containing directions for the management of his library at Oxford, and a great deal in praise of learning, in bad Latin, 2. *Epistola familiarium*; some of which are written to the famous Petrarch. 3. *Orationes ad principes*; mentioned by Bale and Pitts.

AVON, a river which rises in Wilts, coats the edge of the New Forest, and enters the English Channel at Christchurch-bay, in Hampshire.

AVON, a river that rises in Leicestershire, and running S.W. by Warwick, continues its course by Evesham, and falls into the Severn at Tewksbury.

AVON, LOWER, a river that rises in Wiltshire, and running W. to Bath, becomes navigable there, continues its course to Bristol, and falls into the Severn N.W. of that city.

AURELIANUS (Lucius Domitius), emperor of Rome, was one of the greatest generals of antiquity, and commanded the armies of the Emperor Claudius with such glory, that after the death of that emperor all the legions agreed to place him on the throne; this happened in the year 270. He carried the war from the east to the west, with as much facility, says a modern writer, as a body of troops marches from Alsace into Flanders. He defeated the Goths, Sarmatians, Marcomanni, the Persians, Egyptians, and Vandals; conquered Zenobia, queen of the Palmyrenians, and Tetricus, general of the Gauls; both of whom were made to grace his triumph, in the year 274. He was killed by one of his generals in Thrace, in the year 275, when he was preparing to enter Persia with a great army. See *ROME*.

AURICULAR, whatever belongs or relates to the ear.

AURICULAR Tube, an instrument to facilitate hearing. See *ACOUTICS* and *TRUMPET*.

AURUNGABAD, a considerable city of Asia, in the Decan of Hindoostan. It is but a modern city; owing its rise, from a small town, to the capital of Dowlatabad, to the great Aurungzebe, from whom it had its name. It is 260 miles N.E. of Bombay. Long. 76. 2. E. Lat. 19. 45. North.

AUSONIUS. (in Latin *Decius*, or rather *Decimus*, Magnus Ausonius), one of the best poets of the fourth century, was the son of an eminent physician, and born at Bourdeaux. Great care was taken of his education, the whole family interesting themselves in it, either because his genius was very promising, or that the scheme of his nativity, which had been cast by his grandfather on the mother's side, made them imagine that he would rise to great honour. He made an uncommon progress in classical learning, and at the age of 30 was chosen to teach grammar at Bourdeaux. He was promoted some time after to be professor of rhetoric,

in which office he acquired so great a reputation, that he was sent for to court to be preceptor to Gratian, the Emperor Valentinian's son. The rewards and honours conferred on him for the faithful discharge of his office prove the truth of Juvenal's maxim, that when fortune pleases she can raise a man from a rhetorician to the dignity of a consul. He was actually appointed consul by the Emperor Gratian, in the year 379, after having filled other considerable posts; for besides the dignity of quaestor, to which he had been nominated by Valentinian, he was made prefect of the Prætorium in Italy and Gaul, after that prince's death. His speech, returning thanks to Gratian on his promotion to the consulship, is highly commended. The time of his death is uncertain; he was still living in 392, and lived to a great age. The Emperor Theodosius had a great esteem for Ausonius, and pressed him to publish his poems. There is a great inequality in his works; and in his manners and his style there is a harshness which was perhaps rather the defect of the times he lived in, than of his genius. Had he lived in Augustus's reign, his verses, according to good judges, would have equalled the most finished of that age. He is generally supposed to have been a Christian: some ingenious authors indeed think otherwise, but, according to Mr. Bayle, without just reason.—The best edition of his poems is that of Amsterdam, in 1671.

AUSTIN (St.). See ST. AUGUSTINE.

AUTRE-ÉGLISE, a village of Brabant, in the Austrian Netherlands; to which the left wing of the French army extended, when the confederates obtained the victory at Ramillies, in 1706. E. long. 4° 50'. N. lat. 50° 40'.

AUTRICUM, the capital of the Carnutes, a people of Gallia Celtica; afterwards called *Carnotena*, *Carnotenus*, and *Civitas Carnotensium*; now *Chartres*, in the Orleanois on the Eure. E. long. 1° 32'. N. lat. 48° 47'.

AWATSKA-BAY, a harbour of Kamtschatka, said to be the safest and most extensive that has been discovered, and the only one, in that part of the world, that can admit vessels of a considerable burden. The entrance into it is in 52° 51'. N. lat. 158° 48'. E. long.

AWE, Loch, one of the most beautiful lakes of Scotland, in Argyleshire, about thirty miles long, and, in some parts, above two broad. It contains many fine little islands, tufted with trees. The river Awe, the outlet of this lake, is discharged into Loch Etive, at the village of Bunawe.

AXATI, a town of ancient Bætica, in the Bætis; now *Lora*, a small city of Andalusia in Spain, seated on the Guadalquivir. W. long. 5° 20'. N. lat. 37° 20'.

AXIOPOLIS, a town of the Triballi, in Mæsia Inferior; now *Axiopolis* in Bulgaria. E. long. 34° 0'. N. lat. 45° 40'.

AXTEL (Daniel), a colonel in the service of the long parliament, and executed for the share he had in the murder of King Charles I. He was of a good family, and had a tolerable education, that is to say, such a one as might fit him for the course of life it was intended he should lead, being placed by his relations as an apprentice to a grocer in Watling-street. As he was of a very serious disposition, and had been very early tainted with those principles which were in that age styled puritanical, he became an eager follower of such ministers as distinguished themselves by their zealous preaching. His great attachment to these sort of people, and the natural warmth of his own temper, were the occasions of his quitting his own calling, and going into the army, in which he behaved with so much zeal, courage, and conduct, that he rose by degrees to the several commands of captain, major, and lieutenant-colonel, in a regiment of foot. It was in this last capacity, that he acted

with great vehemence against all endeavours for a reconciliation with the king.

On the twentieth of January, when the king was brought before the high court of justice, Colonel Stubberd, and Colonel Axtel, had the command of the soldiers below stairs. The king demanded of Serjeant Bradshaw, who was the president, by what authority they brought him there? And the president appealing to the charge, which was in the name of the Commons and People of England, Lady Fairfax, the general's wife, cried out, "It is a lie, it is false, not a half, not a quarter of the people; Oliver Cromwell is a rogue and a traitor;" which words were repeated by Mrs. Nelson. Upon this Colonel Axtel cried out, "Down with the whores, shoot them;" which vehemence of his made him be taken notice of. After the sentence was passed, the king was carried through the middle of King-street, in a common sedan, by two porters, who, out of reverence to his person, went bare headed, till the soldiers, under Colonel Axtel's command, beat them, and forced them to put on their hats. After the murder of the king, when Cromwell was sent into Ireland, the regiment in which Colonel Axtel served was drawn out by lot for that expedition, which occasioned his going over into that kingdom, where he made a considerable figure, was much esteemed and trusted by Cromwell, and raised, for his fidelity, courage, and conduct, to the command of a regiment, and the government of Kilkenny and the adjacent precinct.

After the death of the protector, Oliver, which happened on the third of September, 1658, things took a new turn, and Axtel used his utmost industry to conceal himself, as foreseeing that it would not be long before he might be called to an account for the large share he had taken in the trial of the king; but his care in this respect was to very little purpose, for before the close of the month, he was discovered and committed to prison. On the 10th of October following, the grand jury for the county of Middlesex, having found bills against twenty-eight persons, for their concern in the king's murder, of which Mr. Axtel was the last, they were brought to the sessions-house, in the Old Bailey, where Colonel Axtel was the same day arraigned, upon an indictment for compassing and imagining the death of the late king. The trial lasted, on account of the prisoner's long and large defence, for upwards of three hours; but the jury, without going from the bar, found him guilty, and on the 19th of October he was executed at Tyburn.

AXUM, a village, supposed to have been once the capital of Abyssinia. Its ruins are very extensive, but, like the cities of ancient times, consist altogether of public buildings. In one square there are forty obelisks, none of which have any hieroglyphics on them. They are all of one piece of granite, and on the top of that which is standing, is a *patera* exceedingly well carved in the Greek taste. It is 125 miles W. of the Red Sea. Long. 36° 4'. E. Lat. 14° 6' N.

AYLESBURY (Thomas), the second son of William Aylesbury, was born in London, in the year 1576. He received his education in Westminster-school, from whence he went to Oxford, and in 1598 became a student of Christ-church. He distinguished himself there by his assiduous application to his studies, and especially affected the mathematics. This made him known to persons of the greatest parts in the university, and was the reason of his being cherished by some of the greatest quality in the kingdom. On the 19th of June, 1605, he took his degree of master of arts. After he quitted the university, he became secretary to Charles,

earl of Nottingham, then lord high-admiral of England; in which post he had an opportunity of improving his mathematical knowledge, as also of giving many and shining proofs of it. On this account, when George Villiers, duke of Bucks, succeeded the Earl of Nottingham as high-admiral, Mr. Aylebury not only kept his employment, but was also, by the favour of that powerful duke, created a baronet, the 19th of April, 1627, having been before made master of requests, and master of the mint. These great employments, as they furnished him with the means of expressing his regard for learned men, so in him they met a person who put them to their right use. He not only made all men of science welcome at his table, and afforded them all the countenance he could, but likewise gave to such of them as were in narrow circumstances, regular pensions out of his pocket, and carried them with him to his house in Windsor-park, where he usually spent the summer. In 1642, adhering steadily to the king, he was of consequence stripped of his places, and plundered of his estate. However, he bore up cheerfully under his misfortunes till 1649, when, having seen the bloody murder of his sovereign, he grew sick of his country, and retiring with his family into Flanders, lived for some time at Brussels. In 1652 he removed to Breda, where he led a very private life, his loyalty having left him very little to live on; and in 1657, being then eighty-one years of age, he ended his days with honour.

AYLESBURY (William), son of the before-mentioned Sir Thomas Aylebury, became very early a gentleman-commoner of Christ-church, and took a degree in arts at sixteen years of age. Though he had at that time the prospect of a very plentiful fortune, yet he pursued his studies with such diligence, and behaved with so much modesty and prudence, that King Charles I. made choice of him to be governor to George Villiers, duke of Bucks, and his brother Lord Francis, with whom he went to travel. He met in Italy with a very extraordinary misfortune. Walking one evening in the garden of the house where they lodged, he was shot, through a hole in the wall, and a couple of bullets lodged in his thigh: those who did it leaped over the wall, came up, and looked upon him, begged his pardon, told him they were mistaken, and that they intended to have shot another person, which was all the satisfaction he ever received. He returned into England with his pupils a little after the civil war commenced, and carried them with him to Oxford, where he presented them to the king. His majesty expressed his great satisfaction in regard to Mr. Aylebury's conduct, and promised on the first vacancy, to make him groom of his bed-chamber; which promise, however, he lived not to perform. After the king's murder, he retired with his father to Antwerp, and dwelt there as long as his circumstances would afford it: but at length, through very want, returned into England in the year 1650; spending his time here, as most of the Royalists did, in seeking shelter and a meal of meat where it was to be had. Living sometimes in one place, sometimes in another, chiefly at Oxford, which was always loyal, till the year 1657, when the protector fitted out a fleet to go on some expedition to the West Indies, as also to carry a supply to the island of Jamaica, our author, from pure necessity, engaged himself as secretary to the governor; which post he enjoyed not long, death removing him when he had been but a short time in the island.

AYLMER (John), was born of a good family at Aylmer-hall in Norfolk, about the year 1521. Grey marquis of Dorset, and afterwards duke of Suffolk, taking a liking to him when he was very young, entertained him as his scholar, and gave him an exhibition at the university of Cambridge, where Mr. Wood supposes he took his degrees in arts; after which

the marquis made him tutor to his children, among whom was the Lady Jane Grey, afterwards queen. He early adopted the opinions of the reformers; and under the patronage of the Duke of Suffolk and the Earl of Huntingdon, in the reign of Edward VI. was for some time the only preacher in Leicester-therne, and was highly instrumental in bringing over the people of that county to the Protestant religion. In 1553 he was made archdeacon of Stow in the diocese of Lincoln. In the convocation which sat in the first year of Queen Mary, he distinguished himself by his warmth against popery. The violent measures of that queen's ministry rendered his stay in England unsafe; he retired beyond sea, and resided first at Strasburg, and afterwards at Zurich in Switzerland, where he undertook the instruction of several young gentlemen in classical learning and religion. During his exile he also visited the universities of Italy and Germany. At that of Jena in Saxony he was offered the Hebrew professorship; but, having a near prospect of returning home, he declined it. After the accession of Queen Elizabeth, he came back to England; and in the beginning of that prince's reign, was one of the eight divines appointed to dispute at Westminster, before many persons of distinction, against an equal number of popish bishops. In 1562, by the interest of Secretary Cecil, he was made archdeacon of Lincoln; and assisted at the synod held this year, wherein the doctrine and discipline of the church, and the reformation from popery, were established. He continued long without any other considerable preferment, though often nominated by the Archbishop of Canterbury to some vacant bishopric. However, he was appointed one of the queen's justices of the peace for the county, and one of her ecclesiastical commissioners. In 1573 he accumulated the degree of bachelor and doctor in divinity in the university of Oxford. In 1576 on the translation of his friend and fellow exile, Dr. Edwin Sandys, to the archbishopric of York, he was made bishop of London; and though Sandys had been very instrumental in his promotion, recommending him to the queen as a proper person for his successor, he sued him for dilapidations, and after some years' prosecution recovered 500 or 1000*l*.

When the plague raged in London in 1578, his principal attention was directed to preserve the lives of his clergy; and yet to make provision that the infected might be visited, and have proper assistance with respect to religion. He summoned the London clergy before him, in order to elect and appoint out of their body visitors of the sick, purposing to spare the rest by reason of the danger of the infection. Strype tells us, that the forwardness of many ministers to undertake this office was remarkable; some from covetousness, others from vain glory, and others to supply their wants. The bishop likewise ordered books, containing directions for preventing the rage of the pestilence, to be printed and dispersed.

In 1581 he proposed that a number of learned and sound divines might be appointed to preach at set times before great assemblies, particularly at St. Paul's Cross, for confirming the people's judgments in the doctrine and discipline of the established church, which was then struck at and undermined by many; and that for the support of it, contributions should be made and settled on the preachers by the city. But Sir John Branch, lord mayor, and the aldermen, did not much like this motion, on account of the standing charge to which it must put the city; so the design was dropped.

Beginning now to be uneasy in his diocese of London, he used all his endeavour to obtain a removal to the see of Ely, or that of Winchester, but without success. When he came to be broken with age, he was desirous to resign his bishopric to Dr. Bancroft, but the latter refused it. He died at Fulham, the 3d of June, 1594, aged seventy-three. He was an excel-

lent logician and historian, and well skilled in the Hebrew tongue: he understood the civil law, divinity, and the ancient writers; and was a rhetorical, bold, and pathetic preacher.

AYLOFFE (Sir Joseph), of Framfield in Suffex, was descended from a Saxon family, anciently seated at Boston Alost near Wye, in the county of Kent, in the reign of Henry III. who removed to Horn-church in the county of Essex in that of Henry IV. and to Sudbury in that of Edward IV. Sir William Ayloffe of Great Braxtate in the county of Essex was knighted by James I. May 1, 1603, and created a baronet November 25, 1612; and from his eldest son by his third wife, the late baronet was the fourth in descent and fifth in title. His father and grandfather were both of Gray's Inn. He was born about the year 1708; received the early part of his education at Westminster-school; admitted of Lincoln's Inn 1724, and in the same year was entered a gentleman-commoner at St. John's College, Oxford, which college he quitted about 1728; elected F.A.S. February 10, 1731; one of the first council under their charter, 1751; vice-president, and F.R.S. June 3, 1731. He prevailed on Mr. Kirby, painter in Ipswich, to make drawings of a great number of monuments and buildings in Suffolk, of which twelve were engraved, with a description, 1743; and others remain unpublished. He had at that time an intention to write a history of the county; but, being disappointed of the materials which he had reason to expect for so laborious a work, they were never published. On the building of Westminster-bridge, he was appointed secretary to the commissioners 1736-7; and on the establishment of the Paper-office, on the respectable footing it at present is, by the removal of the state-papers from the old gate at Whitehall to new apartments at the Treasury, he was nominated the first in the commission for the care and preservation of them. In 1757 he circulated proposals for printing, by subscription, *Encyclopædia*; or, a rational Dictionary of Arts and Sciences, and Trade. In 1772 he published, in 4to. *Calendars of the Ancient Charters, &c.* and of the Welsh and Scottish Rolls now remaining in the Tower of London, &c. and in the introduction gives a most judicious and exact account of our public records. He drew up the account of the chapel of London-bridge, of which an engraving was published by Vertue, 1748, and again by the Society of Antiquaries, 1777. His historical description of the interview between Henry VIII. and Francis I. on the Champ de Drap d'Or, from an original painting at Windsor, and his account of the paintings of the same age at Cowdray, were inserted in the third volume of the *Archæologia*, and printed separately to accompany engravings of two of these pictures by the Society of Antiquaries, 1775. His account of the body of Edward I. as it appeared on opening his tomb, 1774, was printed in the same volume, p. 376. Having been educated, as has been observed, at Westminster, he acquired an early affection for that venerable cathedral; and his intimate acquaintance with every part of it displayed itself in his accurate description of five monuments in the choir, engraved in 1779 by the same Society, who must reckon, among the many obligations which they owe to his zeal and attention to their interests, the last exertions of his life to put their affairs on the most respectable and advantageous footing, on their removal to their new apartments in Somerset-Place. He superintended the new edition of Leland's *Collectanea*, in nine volumes 8vo. and also of the *Liber Niger Scaccarii*, in two volumes 8vo. to each of which he added a valuable appendix. He also revised through the press a new edition of Hearne's *Curious Discourses*, 1771, two volumes 8vo.; and likewise the *Registrum Rossense*, published by Mr. Thorpe in 1769, folio. At the beginning of the seventh volume of Somers's *Tracts* is advertised, *A Collection of Debates in Parliament before the Restoration*, from

MSS. by Sir Joseph Ayloffe, bart. which is supposed never to have appeared. Sir Joseph died at his house at Kennington-lane, Lambeth, April 19, 1781, aged seventy-two.

AYRMIN, or AYERMIN (William), bishop of Norwich in the reigns of Edward II. and III. was descended of an ancient and wealthy family, seated at Osgodby in Lincolnshire. He was a canon in the cathedral church of York, and afterwards in that of Wells; and was for some time keeper of the seal, and vice-chancellor to King Edward II. under the chancellor John bishop of Norwich, who could not discharge his office by reason of sickness. About this time, ann. 1319, a war having broken out between England and Scotland, Ayrmyn had the misfortune to be taken prisoner, in a battle between the Scotch and Yorkists. Afterwards recovering his liberty, he was made chancellor of England under King Edward III. and afterwards treasurer. Being sent ambassador to the court of Rome, he is said to have neglected the business of his embassy, and to have employed his time and interest in obtaining the bishopric of Norwich, which was then vacant. In which application meeting with success, he returned to take possession of that see: which the king hearing, and being disgusted at his proceedings, sent soldiers to Norwich to apprehend him; but Ayrmyn lay hid in the cathedral church, till, by the interposition of friends, the king was reconciled to him, and contented to his consecration.

AYSCOUGH (George Edward), esq. a lieutenant in the first regiment of foot-guards, was only son of the Rev. Dr. Francis Ayscough, who was tutor to Lord Lyttleton at Oxford, and at length dean of Bristol. In September 1777 he went to the Continent for the recovery of his health. While on his travels, he wrote an account of his journey, which, on his return, he published under the title of *Letters from an Officer in the Guards to his Friend in England*; containing some Accounts of France and Italy, 1778, 8vo. He received however but a temporary relief from the air of the Continent. After lingering for a short time, he died October 14, 1779.

AYSCUE, AYSOUGH, ASKEW (Sir George), an eminent English admiral in the last century. He was descended from a very good family in Lincolnshire, and entered early into the sea service, where he obtained the character of an able and experienced officer, and the honour of knighthood from King Charles I. This, however, did not prevent him from adhering to the parliament, when, by a very singular intrigue, they got possession of the fleet; and so zealous he was in the service of his masters, that when, in 1648, the greatest part of the navy went over to the Prince of Wales, he, who then commanded the *Lion*, secured that ship for the parliament, which was by them esteemed an acceptable service, and an action of great importance. As this was a sufficient proof of his fidelity, he had the command given him in a squadron, that was employed to watch the motions of the Prince of Wales; and accordingly sailed thither with the coast of Ireland, where, by his vigilance, he prevented his highness from doing what he would otherwise have done, and by his great interest with the seamen he drew many of them back to that service from which they had deserted. This recommended him strongly to the parliament, who, the next year, sent him with a considerable number of ships, and the honourable title of admiral in those seas, to the coast of Ireland, which commission he discharged with equal vigour and vigilance. After the war was finished in Ireland, and the parliament had thereby time and opportunity to think of the proper means of subduing the rest of the dominions of the crown of England to their obedience, Sir George Ayscue had orders to sail with a small squadron to reduce the island of Barbadoes, which he effected.

On the 21st of June, 1652, Sir George Ayscue, in obedience to the orders he had received from London, came to Dover,

with his eleven sail, and there joined his old friend Admiral Blake, on board whose ship he dined, and was received with all imaginable marks of respect and kindness by that famous commander. In the beginning of the next month, Blake having received orders to sail northward, and destroy the Dutch herring fishery, Sir George Ayscue was left to command the fleet in the Downs. Within a few days after Blake's departure, he took five sail of Dutch merchantmen, and had scarcely brought them in, before he received advice, that a fleet of forty sail had been seen not far from the coast, upon which he gave chase, fell in amongst them, took seven, sunk four, and ran twenty-four upon the French shore, all the rest being separated from their convoy, which, considering that Sir George had with him only the squadron he brought with him from Barbadoes, was very gallantly performed. After various other successful engagements with the Dutch, Sir George at length laid down his commission. He retired after this to his country seat in the county of Surrey, and lived there in great honour and splendor till the death of the Protector. On the restoration of Charles II. Sir George Ayscue had the honour to be introduced to his majesty, and to kiss his hand. Soon after the Dutch war breaking out, he was immediately put into commission by the direction of the Duke of York, who then commanded the English fleet. In the spring of the year 1665, Sir George Ayscue hoisted his flag as rear-admiral of the blue, under the right honourable the Earl of Sandwich, and in the great battle that was fought the 3d of June in the same year, that squadron had the honour to break through the Dutch fleet, and thereby made way for one of the most glorious victories ever obtained by this nation at sea: for, in this battle, the Dutch had ten of their largest ships sunk or burned, besides their Admiral Opdam's, which blew up in the midst of the engagement, by which the admiral himself, and upwards of five hundred men, perished. Eighteen men-of-war were taken, four fire-ships destroyed, thirteen captains, and two thousand and fifty private men, made prisoners; and this with fo inconsiderable a loss, as that of one ship only, and three hundred private men.

On the 1st of June, 1666, the Dutch and English fleets again met. This day's fight was very fierce and bloody; for the Dutch, confiding in their numbers, pressed furiously upon the English fleet, while the English officers, being men of determined resolution, fought with such courage and constancy, that they not only repulsed the Dutch, but renewed the attack, and forced the enemy to maintain the fight longer than they were inclined to do, so that it was ten in the evening before their cannon were silent. The following night was spent in repairing the damages suffered on both sides, and next

morning the fight was renewed by the English with fresh vigour. On the third day Sir George Ayscue, who commanded the Royal Prince (being the largest and heaviest ship of the whole fleet), unfortunately struck upon the sand called the Galloper, where, being threatened by the enemy's fire-ships, and hopeless of assistance from his friends (whose timely return, the near approach of the enemy, and the tide, had absolutely rendered impossible), he was forced to surrender, and was carried to the Hague. It is said, that he afterwards returned to England, and spent the remainder of his days in peace.

AYR, a borough and sea-port of Ayrshire, situated on a sandy plain, and built on both sides of the river Ayr, over which is a bridge of four arches. Its chief trade is in coal and grain; the fishery being in a manner given up. In the New-Town are many good houses, and the ruins of a Dominican monastery, founded by Alexander II. in 1230. A mile north from the town, is a house called King's Chapel, founded for lepers by Robert Bruce. The leprosy was a disease so common in those days, as to be the subject of several parliamentary statutes; but it is now scarcely known in Europe. Ayr is 65 miles S. W. of Edinburgh. Long. 4. 39. E. Lat. 55. 30. N.

AYRSHIRE, a county of Scotland, bounded on the west, north-west, and north, by the frith of Clyde and Renfrewshire; on the east by the counties of Lanerk and Dumfries; and on the south-east and south by the shires of Kirkcudbright and Wigton. It exhibits the shape of two wings, extending to the north-west and south-west, and forming a vast bay at the mouth of the frith of Clyde. Between its extreme points, it measures about 50 miles; its greatest breadth is not quite 27. Its most northerly division is Cunningham, the north-west angle of which, though mountainous, is rich in pasture.

AYTONIA (*Encycl.*). In that article the *clafs* is erroneously put for the *order*; and *vice versa*.

AZARIAH, or UZZIAH, king of Judah, succeeded his father Amaziah, 850 years before Christ. He assembled an army of above 300,000 men, with which he conquered the Philistines, and demolished the walls of Gath, Jabnial, and Ashdod; built up the walls of Jerusalem; furnished the city with conduits; and planted gardens and vineyards: but at last being elated with his prosperity, and resolving to usurp the office of high-priest, he was struck with a leprosy, which obliged him to remain shut up in his palace for the rest of his days. He died about 759 years before the Christian æra, and was succeeded by Jonathan his son.—There are several other persons of this name mentioned in the sacred Scriptures.

B

B A B

BABINGTON (Gervase), bishop of Worcester, was born, according to Fuller, in Nottinghamshire; but in what year is uncertain. He was sent to Trinity College, Cambridge, of which he was made fellow; and, in 1578, was incorporated master of arts at Oxford. He appears, however, to have made Cambridge the place of his residence, where he became an eminent preacher; and, being now doctor in divinity, was

B A B

made domestic chaplain to Henry earl of Pembroke. In this station he is supposed to have assisted the countsess in her translation of the Psalms. In 1581, he was installed prebend of Hereford, and, in 1591, consecrated bishop of Landaff. In 1594, he was translated to the see of Exeter, and thence to Worcester in 1597. About this time, or soon after, he was made queen's counsel for the marches of Wales. He was a

considerable benefactor to the library belonging to the cathedral of Worcester, where he was buried, in May 1610, without a monument. The several historians, who have mentioned this prelate, agree in giving him the character of a learned and pious man. His writings, like those of most of his contemporaries, abound with puns and quaint expressions. His works were printed both in folio and quarto in 1615, and again in folio in 1637, under this title: *The works of the right reverend father in God Gerouse Babington, late Bishop of Worcester, containing comfortable notes upon the five books of Moses, viz. Genesis, &c. As also an exposition upon the Creed, the Ten Commandments, the Lord's Prayer; with a conference betwixt man's frailty and faith, and three sermons, &c.*

BABOLITZA CARETHNA, or BABOLIZA, a town of Scлавonia, seated near the river Drave, between Poßlega and Zygeth.

BABYLON (*Enegel*). This capital was surrounded with walls, in thickness 87 feet, in height 350 feet, and in compass 480 furlongs, or 60 of our miles. Thus Herodotus, who was himself at Babylon; and though some disagree with him in these dimensions, yet most writers give us the fame, or near the fame, as he does. Diodorus Siculus diminishes the circumference of these walls very considerably, and takes somewhat from the height of them, as in Herodotus; though he seems to add to their breadth, by saying, that six chariots might drive a-breast thereon; while the former writes, that one chariot only might turn upon them; but then he places buildings on each side of the top of these walls, which, according to him, were but one story high: which may pretty well reconcile them together in this respect. It is observed, that those who give the height of these walls but at 50 cubits, speak of them only as they were after the time of Darius Hytaspis; who had caused them to be beaten down to that level. These walls formed an exact square, each side of which was 120 furlongs, or 15 miles, in length; and were all built of large bricks cemented together with bitumen, which in a short time grows harder than the very brick and stone which it cements. The city was encompassed, without the walls, with a vast ditch filled with water, and lined with bricks on both sides; and, as the earth that was dug out of it served to make the bricks, we may judge of the depth and largeness of the ditch from the height and thickness of the walls. In the whole compass of the wall there were 100 gates, that is, 25 on each of the four sides, all made of solid brais. Between every two of these gates, at proper distances, were three towers, and four more at the four corners of this great square, and three between each of these corners and the next gate on either side, and each of these towers was ten feet higher than the walls. But this is to be understood only of those parts of the walls where towers were needful for defence. For some parts of them being upon a morass, and inaccessible by an enemy, there the labour and cost was spared, which, though it must have spoiled the symmetry of the whole, must be allowed to have favoured of good economy; though that is what one would not have expected from a prince who had been so determined, as Nebuchadnezzar must have been, to make the city complete both for strength and beauty. The whole number, then, of these towers amounted to no more than 250; whereas a much greater number would have been necessary to have made the uniformity complete all round. From the 25 gates in each side of this square, there was a straight street, extending to the corresponding gate in the opposite wall; whence the whole number of the streets must have been but 50; but then they were each about 15 miles long, 25 of them crossing the other 25 exactly at right angles. Besides these whole streets, we must reckon four half streets, which were but rows of houses facing the four inner sides of the walls. These four

half streets were properly the four sides of the city within the walls, and were each of them 200 feet broad, the whole streets being about 150 of the fume. By this intersection of the 50 streets, the city was divided into 676 squares, each of four furlongs and an half on each side, or two miles and a quarter in compass. Round these squares on every side towards the streets stood the houses, all of three or four stories in height, and beautified with all manner of ornaments; and the space within each of these squares was all void, and taken up by yards, or gardens, and the like, either for pleasure or convenience.

A branch of the Euphrates divided the city into two, running through the midst of it, from north to south; over which, in the very middle of the city, was a bridge, a furlong in length, or rather more, and indeed much more, if we hearken to others, who say it was no less than five fadles or furlongs in length, though but 30 feet broad, a difference we shall never be able to decide: this bridge, however, is said to have been built with wonderful art, to supply a defect in the bottom of the river, which was all sandy. At each end of this bridge were two palaces; the old palace on the east side, the new one on the west side of the river; the former of which took up four of the squares above mentioned, and the latter nine. The temple of Belus, which stood next to the old palace, took up another of the same squares.

The whole city stood in a large flat or plain, in a very fat and deep soil; that part or half of it on the east side of the river was the old city, and the other on the west was added by Nebuchadnezzar, both being included within the vast square bounded by the walls aforesaid. The form of the whole was seemingly borrowed from Nineveh, which was also 480 furlongs; but, though it was equal in dimensions to this city, it was less with respect to its form, which was a parallelogram, whereas that of Babylon was an exact square. It is supposed that Nebuchadnezzar, who had destroyed that old seat of the Assyrian empire, proposed that this new one should rather exceed it; and that it was in order to fill it with inhabitants, that he transported such numbers of the captives from other countries hither; though that is what may be disputed, seeing he therein only followed the constant practice of the kings of Assyria, who thought this the most certain means of assuring their conquests either to themselves, or their posterity.

But it plainly appears, that it was never wholly inhabited; so that, even in the meridian of its glory, it may be compared with the tower of the field, which flourishes to-day, and to-morrow is no more. It never had time to grow up to what Nebuchadnezzar visibly intended to have made it; for, Cyrus removing the seat of the empire soon after to Shushan, Babylon fell by degrees to utter decay; yet it must be owned, that no country was better able to support so vast and populous a city, had it been completed up to its first design. But so far was it from being finished according to its original design, that, when Alexander came to Babylon, Q. Curtius tells us, "No more than 90 furlongs of it were then built:" which can be no otherwise understood than of so much in length; and, if we allow the breadth to be as much as the length (which is the utmost that can be allowed), it will follow, that no more than 8100 square furlongs were then built upon: but the whole space within the walls contained 14,400 square furlongs; and therefore there must have been 6300 square furlongs remaining unbuilt, which, Curtius tells us, were plowed and sown. And, besides this, the houses were not contiguous, but all built with a void space on each side, between house and house.

The next great work of Nebuchadnezzar was the temple of Belus. The wonderful tower, however, that stood in the mid-

le of it, was not his work, but was built many ages before; that, and the famous tower of Babel, being, as is commonly supposed, one and the same structure. This tower is said to have been composed of eight pyramidal ones raised above one another, and by Herodotus said to have been a furlong in height; but as there is an ambiguity in his expression, it has been disputed whether each of the towers was a furlong in length, or the whole of them taken together. On the latter supposition, which is the most probable, this tower must have exceeded the highest of the Egyptian pyramids by 179 feet, though it fell short of its breadth at the basis by 33. The way to go up was by stairs on the outside round it; whence it seems most likely, that the whole ascent was, by the benching in, drawn in a sloping line from the bottom to the top eight times round it; and that this made the appearance of eight towers, one above the other. Till the times of Nebuchadnezzar, it is thought this tower was all the temple of Belus; but as he did by the other ancient buildings of the city, so he did by this, making great additions thereto, by vast edifices erected round it, in a square of two furlongs on every side, and just a mile in circumference, which exceeded the square at the temple of Jerusalem by 1800 feet. On the outside of these buildings was a wall, which inclosed the whole; and, in consideration of the regularity wherewith this city was to all appearance marked out, it is supposed that this wall was equal to the square of the city wherein it stood, and so is concluded to have been two miles and a half in circumference. In this wall were several gates leading into the temple, and all of solid brass; which it is thought may have been made out of the brazen sea, and brazen pillars, and other vessels and ornaments of the kind, which Nebuchadnezzar had transported from Jerusalem; for in this temple he is said to have dedicated his spoils from that of Jerusalem.

In this temple were several images or idols of massy gold, and one of them, as we have seen, 40 feet in height; the same, as supposed, with that which Nebuchadnezzar consecrated in the plains of Dura. For though this last is said to have been 60 cubits, or 90 feet high, these dimensions appear so incredible, that it has been attempted to reconcile them into one, by supposing, that in the 90 feet the height of the pedestal is included, and that the 40 feet are for the height of the statue without the pedestal; and, being said to have weighed 1000 talents of Babylon, it is thence computed, that it was worth three millions and a half of our money. In a word, the whole weight of the statues and decorations, in Diodorus Siculus, amounting to 5000 and odd talents in gold, the whole is estimated at above-one-and-twenty millions of our money; and a sum about equal to the same, in treasure, utensils, and ornaments, not mentioned, is allowed for.

Next to this temple, on the east side of the river, stood the old palace of the kings of Babylon, being four miles in circumference. Exactly opposite to it, on the other side of the river, was the new palace built by Nebuchadnezzar, eight miles in circumference, and consequently four times as big as the old one.

But nothing was more wonderful at Babylon than the hanging-gardens, which Nebuchadnezzar made in compliance to his wife Amyte; who, being a Mede, and retaining a strong inclination for the mountains and forests of her own country, was desirous of having something like them at Babylon. They are said to have contained a square of four plethra, or 400 feet, on each side; and to have consisted of terraces one above another, carried up to the height of the wall of the city, the ascent from terrace to terrace being by steps ten feet wide. The whole pile consisted of substantial arches upon arches, and was strengthened by a wall surrounding it on every side, 22 feet thick; and the floors on each of them were laid in this order:

first, on the tops of the arches was laid a bed, or pavement of stones 16 feet long, and four feet broad; over this was a layer of reed mixed with a great quantity of bitumen; and over this two courses of brick, closely cemented together with plaster; and over all these were thick chests of lead; and on these the earth or mould of the garden. This floorage was designed to retain the moisture of the mould; which was so deep, as to give root to the greatest trees which were planted upon every terrace, together with great variety of other vegetables pleasing to the eye. Upon the uppermost of these terraces was a reservoir, supplied by a certain engine with water from the river, from whence the gardens on the other terraces were supplied.

The other works attributed to Nebuchadnezzar by Berofus and Abydenus, were the banks of the river, the artificial canals, and the great artificial lake said to have been sunk by Semiramis. The canals were cut out on the east side of the Euphrates, to convey the waters of that river, when it overflowed its banks, into the Tigris, before they reached Babylon. The lake was on the west side of Babylon; and, according to the lowest computation, 40 miles square, 160 in compass, and in depth 35 feet, as we read in Herodotus; or 75, as Megasthenes will have it; the former, perhaps, measured from the surface of the sides, and the latter from the tops of the banks that were cut upon them. This lake was dug to receive the waters of the river, while the banks were building on each side of it. But both the lake, and the canal which led to it, were preserved after that work was completed, being found of great use, not only to prevent all overflowings, but to keep water all the year, as in a common reservoir, to be let out, on proper occasions, by sluices, for the improvement of the land.

The banks were built of brick and bitumen, on both sides of the river, to keep it within its channel; and extended on each side throughout the whole length of the city, and even farther, according to some, who reckon they extended 160 furlongs, or twenty miles; whence it is concluded they must have begun two miles and a half above the city, and have been continued an equal distance below it, the length of the city being no more than 15 miles. Within the city they were built from the bottom of the river, and of the same thickness with the walls of the city itself. Opposite to each street, on either side of the river, was a brazen gate in the said wall, with stairs leading down from it to the river: these gates were open by day, and shut by night.

Berofus, Megasthenes, and Abydenus, attribute all these works to Nebuchadnezzar; but Herodotus tells us, the bridge, the banks, and the lake, were the work of a queen after him, called Nitocris, who may have finished what Nebuchadnezzar left imperfect, and thence have had the honour this historian gives her of the whole.

The tower and temple stood till the time of Xerxes. But that prince, on his return from the Grecian expedition, having first plundered it of its immense wealth, demolished the whole, and laid it in ruins. Alexander, on his return to Babylon from his Indian expedition, proposed to rebuild it, and accordingly set 10,000 men on work to clear away the rubbish. But his death happening soon after, a stop was put to all further proceedings in that design. After the death of that conqueror, the city of Babylon began to decline apace; which was chiefly owing to the neighbourhood of Seleucia, built by Seleucus Nicator, as is said, out of spite to the Babylonians, and peopled with 500,000 persons drawn from Babylon, which by that means continued declining till the very people of the country were at a loss to tell where it had stood.

Such is the description we have by ancient historians of the grandeur of this city; which, if these accounts are not exaggerated, must have exceeded every piece of human grandeur

that hath yet appeared. Many of the moderns, however, are of opinion that these magnificent descriptions are very far from being true; although it is certain that few other arguments can be brought against the reality of them, than that we do not see things of a similar kind executed in our own days.

BABYLONIA (*Encycl.*). Concerning the nature of the country, manners, customs, &c. of the ancient Babylonians, the following account is collected by M. Sabbathier.

"As all the nations under the dominion of Cyrus, beside the ordinary tributes, were obliged to maintain him and his army, the monarch and his troops were supported by all Asia. The country of Babylon alone was obliged to maintain him four months of the year; its fertility, therefore, yielded a third of the produce of Asia. The government of this country, which the Persians termed *Jatruppy*, was richer and more extensive, than any of the rest. It maintained for the king, besides the war-horses, a stud of 800 stallions, and 16,000 mares. So great a number of Indian dogs were likewise bred in this province for the king, that four of its cities kept those animals; and, in return, they were exempted from all taxes and tributes.

"It rained very seldom in this country, according to Herodotus. The earth was watered by the river, which was here diffused by human industry, as the Nile is over Egypt by nature: for all the country of Babylon was divided by canals, the greatest of which was navigable, and flowed from south to north, from the Euphrates to the Tigris. In short, it was one of the finest countries for corn in the world; but for producing trees, the fig-tree, the vine, and the olive, it was not famous. It was so luxuriant in grain, that it commonly yielded a hundred times more than what was sown; and in its good years it yielded three hundred times more than it received. The leaves of its wheat and barley were four inches broad. "Though I know," says Herodotus, "that the millet and the sesame of that country grow to the size of trees, I will not describe them particularly; lest those who have not been in Babylonia should think my account fabulous."

"They had no oil but what they made from Indian corn. The country abounded with palm-trees, which grew spontaneously; and most of them bore fruit, of which the inhabitants made bread, wine, and honey. They cultivated these trees and their fig-trees in the same manner. Some of them, as of other trees, the Greeks called *male ones*. They tied the fruit of the male to the trees which bore dates; that the mosquito, leaving the male, might cause the date to ripen, by penetrating it; for without that assistance it came not to maturity. Mosquitos bred in the male palms, as in the wild fig-trees.

"But we must not here omit to give an account of the peculiar and surprising construction of their boats of skins, in which they sailed along the river to Babylon. These boats were invented by the Armenians, whose country lay north from Babylonia. They made them with poles of willow, which they bent, and covered with skins: the bare side of the skins they put outwards; and they made them so tight, that they resembled boards. The boats had neither prow nor stern, but were of a round form, like a buckler. They put straw on the bottom. Two men, each with an oar, rowed them down the river, laden with different wares, but chiefly with palm-wine. Of these boats some were very large, and some very small. The largest carried the weight of 500 talents. There was room for an ass in one of their small boats; they put many into a large one. When they had unloaded, after their arrival at Babylon, they fold the poles of their boats, and the straw; and loading their asses with the skins, returned to Armenia: for they could not sail up the river, its current was so rapid. For this reason they made their boats of skins, instead

of wood; and on their return to Armenia with their asses, they applied the skins to their former use.

"As to their dresses, they wore a linen shirt, which came down to their feet. Over it they wore a woollen robe; their outer garment was a white veil. Their shoes resembled those of the Thebans. They let their hair grow. On their heads they wore a turban. They rubbed their bodies all over with fragrant liquors. Each man had a ring on his finger; and an elegant cane in his hand, with an apple at the top, or a rose, a lily, or an eagle, or some other figure; for they were no suffered to use canes without devices.

"With regard to their policy, Herodotus thinks that their best law was one which the Heneti, an Illyrian people, likewise observed in every town and village. When the girls were marriageable, they were ordered to meet in a certain place, where the young men likewise assembled. They were then sold by the public crier; but he first sold the most beautiful one. When he had sold her at an immense price, he put up others to sale, according to their degrees of beauty. The rich Babylonians were emulous to carry off the finest women, who were sold to the highest bidders. But as the young men who were poor could not aspire to have fine women, they were content to take the ugliest with the money which was given them: for when the crier had sold the handsomest, he ordered the ugliest of all the women to be brought; and asked, if any one was willing to take her with a small sum of money. Thus she became the wife of him who was most easily satisfied; and thus the finest women were sold; and from the money which they brought, small fortunes were given to the ugliest, and to those who had any bodily infirmity. A father could not marry his daughter as he pleased; nor was he who bought her allowed to take her home, without giving security that he would marry her. But, after the sale, if the parties were not agreeable to each other, the law enjoined that the purchase money should be restored. The inhabitants of any of their towns were permitted to buy wives at these auctions. Such were the early customs of the Babylonians.

"But they afterwards made a law, which prohibited the inhabitants of different towns to intermarry, and by which husbands were punished for treating their wives ill. When they had become poor by the ruin of their metropolis, fathers used to prostitute their daughters for gain. There was a sensible custom among the Babylonians, worthy to be related. They brought their sick into the forum, to consult those who passed, on their diseases; for they had no physicians. They asked those who approached the sick, if they ever had the same distemper? if they knew any one who had had it? and how he was cured? Hence, in this country, every one who saw a sick person was obliged to go to him, and enquire into his distemper.

"They embalmed their dead with honey; and their mourning was like that of the Egyptians.

"There were three Babylonian tribes, who lived only upon fish, and who prepared them in the following manner: they dried them in the sun, and then beat them in a mortar to a kind of flour, which after they had sifted through linen, they baked it in rolls.

"The Babylonians at first worshipped only the sun and the moon; but they soon multiplied their divinities. They deified Baal, Bel, or Belus, one of their kings, and Merodach-Baladar. They also worshipped Venus; under the name of *Mylita*. She and Belus were the principal deities of the Babylonians. They counted their day from sun-rise to sun-rise. They solemnized five days of the year with great magnificence, and almost the same ceremonies with which the Romans celebrated their Saturnalia.

"The Babylonians were very much addicted to judicial

astrology. Their priests, who openly professed that art, were obliged to commit to writing all the events of the lives of their illustrious men; and on a fancied connection between them and the motions of the heavenly bodies, the principles of their art were founded. They pretended that some of their books, in which their historical transactions and revolutions were accurately compared with the courses of the stars, were thousands of years old. This assertion of their judicial astrologers we may reasonably dispute; but that their astronomers had made a long series of observations is incontestably true. It is certain that some of those observations were extant in the days of Aristotle, and that they were older than the empire of the Babylonians.

BACACUM, a town of the Nervii in Gallia Belgica; now *Baray*, in Hainault. E. long. 3. 40. N. lat. 19. 0.

BACANO, a village of Italy, in the patrimony of St. Peter; on a small lake, near a river of the same name, well known on account of the defeat of the Fabii, in the 277th year of Rome.

BACCHINI (Benedict), a Benedictine monk, and one of the most learned men in his time, was born at Borgo San Domino, in 1651; and wrote a great number of books, in Latin and Italian, the most considerable of which is a Literary Journal. He died at Bologna, in 1721, aged 70.

BACCHIUS, a follower of Aristoxenus, supposed by Fabricius to have been tutor to the Emperor Marcus Antoninus, and consequently to have lived about A. C. 140. He wrote in Greek a very short introduction to music in dialogue, which, with a Latin translation thereof, Meibomius has published. It seems it was first published in the original by Mericenus, in his Commentary on the first six chapters of Genesis; and that afterwards he published a translation of it in French, which Meibomius, in the preface to his edition of the ancient musical authors, censures as being grossly erroneous.

BACCHUS (*Encycl.*). This personage is seldom named in modern times but as a sensual encourager of feast and jollity; but he was regarded in a more respectable light by the ancients, who worshipped him in different countries under the following appellations: in Egypt, he was called *Osiris*; in Mysia, *Panaces*; in India, *Dionysius*; *Liber*, throughout the Roman dominions; *Adoneus*, in Arabia; and *Pentheus*, by the Lucanians. Mythologists furnish reasons for all these different names given to the same God, which may be seen in the second volume of Banier's Mythology.

It is natural to suppose that the Greeks and Romans, as usual, bestowed upon the one Bacchus which they worshipped, the several actions and attributes of the many divinities known by that name, and by other equivalent denominations in different countries. However, antiquity chiefly distinguished two gods under the title of *Bacchus*: that of Egypt, the son of Ammon, and the same as *Osiris*; and that of Thebes in Bœotia, the son of Jupiter and Semele.

The Egyptian Bacchus was brought up at Nyfa, a city of Arabia Felix, whence he acquired the name of *Dionysius*, or the God of Nyfa; and this was the conqueror of India. Though this Bacchus of the Egyptians was one of the elder gods of Egypt, yet the son of Semele was the youngest of the Grecian deities. Diodorus Siculus tells us, that Orpheus first deified the son of Semele by the name of Bacchus, and appointed his ceremonies in Greece, in order to render the family of Cadmus, the grandfather of the Grecian Bacchus, illustrious.

The great Bacchus, according to Sir Isaac Newton, flourished but one generation before the Argonautic expedition. This Bacchus, says Herimippus, was potent at sea, conquered caltivar as far as India, returned in triumph, brought his army over the Hellespont, conquered Thrace, and left music,

dancing, and poetry, there. And, according to Diodorus Siculus, it was the son of Semele who invented farces and theatres, and who first established a music-school, exempting from all military functions such musicians as discovered great abilities in their art; on which account, says the same author, musicians formed into companies have since frequently enjoyed great privileges.

Dr. Burney observes, that the dithyrambs which gave birth to dramatic representations, are as ancient as the worship of Bacchus in Greece; and there is little doubt but that the ceremonies of his mysteries gave rise to the pomp and illusions of the theatre. Many of the most splendid exhibitions upon the stage for the entertainment of the people of Athens and Rome, being performed upon the festivals of Bacchus, gave occasion to the calling all those that were employed in them, whether for singing, dancing, or reciting, *servants of Bacchus*.

BACCHYLIDES, a famous Greek poet, was the nephew of Simonides, and the contemporary and rival of Pindar. Both sung the victories of Hiero at the public games. Besides odes to athletic victors, he was author of *Love Verses*; *Prologues*; *Dithyrambs*; *Hymns*; *Pæans*; *Hypocæmæ*; *Parthenia*, or songs to be sung by a chorus of virgins at festivals. The chronology of Eusebius places the birth of Bacchylides in the 82d Olympiad, about 450 B.C.

BACCIO, or **BACCUS** (Andrew), a celebrated physician of the 16th century, born at St. Elpidio. He practised physic at Rome with great reputation, and was first physician to pope Sextus V. The most scarce and valuable of his works are, 1. *De iberis*. 2. *De naturali vinorum historia*. 3. *De venenis et antidotis*. 4. *De gemmis ac lapidibus pretiosis*.

BACON (Sir Nicholas), lord keeper of the great seal in the reign of Queen Elizabeth, was born at Chidehurst in Kent, in 1510, and educated at the university of Cambridge; after which he travelled into France, and made some stay at Paris. On his return, he settled in Gray's-Inn, and applied himself with such assiduity to the study of the law, that he quickly distinguished himself so, that on the dissolution of the monastery of St. Edmund's Bury, in Suffolk, he had a grant from King Henry VIII. in the 36th year of his reign, of several manors. In the 38th of the same king he was promoted to the office of attorney in the court of Wards, which was a place both of honour and profit. In this office he was continued by King Edward VI.; and in 1552 he was elected treasurer of Gray's-Inn. His great moderation and consummate prudence preserved him through the dangerous reign of Queen Mary. In the very dawn of that of Elizabeth he was knighted; and on the 22d of December, 1558, the great seal of England, being taken from Nicholas Heath, archbishop of York, was delivered to him with the title of *lord keeper*, and he was also made one of the Queen's privy-council. He had a considerable share in the settling of religion: as a statesman, he was remarkable for a clear head and deep counsels: but his great parts and high preference were far from raising him in his own opinion, as appears from the modest answer he gave Queen Elizabeth, when she told him his house at Redgrave was too little for him; "Not so, madam (returned he), but your majesty has made me too great for my house." After having had the great seal more than twenty years, this able statesman and faithful counsellor was suddenly removed from this life, as Mr. Mallet informs us, by the following accident: he was under the hands of the barber, and thinking the weather warm, had ordered a window before him to be thrown open, but fell asleep as the current of fresh air was blowing in upon him, and awaked some time after dispersed all over. He was immediately removed into his bed chamber, where he died a few days after, on the 26th of February, 1578-9, equally lamented by the queen and her subjects. He was

buried in St. Paul's, where a monument was erected to him, which was destroyed by the fire of London in 1666. Mr. Granger observes, that he was the first lord keeper that ranked as lord chancellor; and that he had much of that penetrating genius, solidity, and judgment, persuasive eloquence, and comprehensive knowledge of law and equity, which afterwards shone forth with so great a lustre in his son, who was as much inferior to his father in point of prudence and integrity as his father was to him in literary accomplishments.

Bacon (Sir Nathaniel), knight of the Bath, and an excellent painter, was a younger son of the lord keeper, and half brother to the great Sir Francis. He travelled into Italy, and studied painting there; but his manner and colouring approaches nearer to the style of the Flemish school. Mr. Walpole observes, that at Culford, where he lived, are preserved some of his works; and at Gorhambury, his father's seat, is a large picture by him in oil, of a cook-maid with a dead fowl, admirably painted, with great nature, neatness, and lustre of colouring. In the same house is a whole length of him, by himself, drawing on a paper, his sword and pallet hung up, and a half length of his mother by him.

Bacon (Anthony), elder brother to the chancellor, and eldest son to the lord keeper Bacon, by his second wife Anne, was born in the year 1558. He received his education at Trinity College in Cambridge. Mr. Anthony Bacon began his travels in 1579, at the age of twenty-one, and resided for some time at Paris, from whence he removed to Bourges, and thence to Geneva, where he lodged at the house of Theodore Beza. From Geneva he successively removed to Montpelier, to Marseilles, to Bourdeaux, to Montaubon, and again to Bourdeaux, where he resided the longest. During his stay abroad, he corresponded with several eminent persons in England, and sometimes communicated intelligence of importance to the public service. In the year 1585 he paid a visit to Henry king of Navarre, at Bearne, where he became acquainted with the learned Lambert Daneau, who had so high an esteem for him, that he dedicated to him several of his works. While Mr. Bacon was at Montaubon, in 1586, he contracted an intimacy with the famous Philip Pleiss du Mornay, and his family. He returned to England in a very ill state of health, in the beginning of February, 1591-2. It was not till the latter end of the year 1595, that he took up his residence in Essex-house; in which situation he carried on a most extensive correspondence. In 1596 Mr. Bacon received a letter from Henry the Fourth, king of France; in which that illustrious monarch assured him of his high esteem, and requested his interest with the Earl of Essex. In the same year he was visited by the Duke de Bouillon, then in England. He quitted Essex-house by the queen's command, in March 1599-1600. The time and place of his death cannot be ascertained. It is certain that he survived the Earl of Essex, and that he did not live till the accession of King James the First.

Bacon (Phanuel), rector of Balden in Oxfordshire, and vicar of Bramber in Sussex, was of Magdalen College, Oxford, where he took the degree of M.A. April 17th, 1722; B.D. April 29th, 1711; D.D. December 7, 1735. He possessed an exquisite fund of humour, was a famous punster, and wrote an admirable poem, called, *The Artificial Kite*. In the year 1757 he published no less than five dramatic performances; viz. 1. *The Taxes*. 2. *The Insignificant*. 3. *The Trial of the Twin-killers*. 4. *The Naval Quack*. 5. *The Oculist*. He died at Balden, January 2, 1783.

Bacon (Robert), an eminent divine, in the thirteenth century, was born about the year 1168. He studied in his youth at Oxford, where he distinguished himself by the quickness of his parts, and his assiduous application to his studies. Thence, according to the custom of that age, he removed to Paris,

where he perfected himself in all the branches of learning, which were in repute in those times. We are not told at what time he returned into England, but it appears clearly, that after his return he settled at Oxford, and read divinity lectures there. In 1233 he was made treasurer of the cathedral church of Salisbury. The same year he distinguished himself by a sermon before his royal master King Henry III. at Oxford, whither his majesty came, in order to have held a great council of his lords. In 1240 Bacon lost his great patron and intimate friend, Edmund archbishop of Canterbury; and very possibly this accident, joined to his fervent piety, and great love of a retired life, might induce Bacon, though he was very old, to enter into the order of Friars Preachers. In gratitude to the memory of the archbishop, Bacon wrote his life, notwithstanding that prelate had for some years lived, and was even so unfortunate as to die, under the king's displeasure: which work of his was highly esteemed. He wrote also many other learned pieces, sufficient to have established his reputation. At length, worn out with so long a course of studious application, he yielded to fate in the year 1248, and was interred at Oxford.

BACANTHORP (John), called *the resolute doctor*, a learned monk, was born towards the end of the 13th century, at Bacanthorp, a village in Norfolk. He spent the early part of his life in the convent of Blackney, near Walsingham, in the same country; whence he removed to Oxford, and from thence to Paris; where being distinguished for his learning, he obtained degrees in divinity and laws, and was esteemed the principal of Averroists. In 1329 he returned to England, and was immediately chosen twelfth provincial of the English Carmelites. In 1333 he was sent for to Rome; where, we are told, he first maintained the pope's sovereign authority in cases of divorce, but that he afterwards retracted his opinion. He died in London in the year 1346. Leland, Bale, and Pits, unanimously give him the character of a monk of genius and learning. He wrote, 1. *Commentaria seu questiones super quatuor libros sententiarum*, and, 2. *Compendium legis Christi, et quolibet*: both which underwent several editions at Paris, Milan, and Cremona. Leland, Bale, and Pits, mention a number of his works never published.

BACTRIA, or BACTRIANA, now *Chorassan* or *Khorasan*, an ancient kingdom of Asia, bounded on the west by Margiana, on the north by the river Oxus, on the south by Mount Paropisus, and on the east by the Asiatic Scythia and the country of the Massagetæ. It was a large, fruitful, and well-peopled country, containing according to Ammianus Marcellinus 1000 cities, though of these only a few are particularly mentioned by historians, of which that commonly called *Marcandæa*, now *Samarcandæ*, is the most considerable.

Of the history of this country we know but little. Authors agree that it was subdued first by the Assyrians, afterwards by Cyrus, and then by Alexander the Great. Afterwards it remained subject to Seleucus Nicator and his successors till the time of Antiochus Theos; when Theodotus, from governor of that province, became king, and strengthened himself so effectually in his kingdom, while Antiochus was engaged in a war with Ptolemy Philadelphus king of Egypt, that he could never afterwards dispossess him of his acquisitions. His posterity continued to enjoy the kingdom for some time, till they were driven out by the Scythians, who reigned in Bactria in the time of Adrian, Antoninus Pius, &c. The Scythians were in their turn driven out by the Huns or Turks, and these often conquered by the Saracens and Tartars; nevertheless they continued in possession of this country in the time of Ladislaus IV. king of Hungary.

In early times the B. &rians differed little in their manners from the Nomades; and being near neighbours of the

Serthians, who were a very warlike people, the Bactrian soldiers were reckoned the best in the world. Their appearance was very savage; being of an enormous stature, having a terrible aspect, rough beards, and long hair hanging down their shoulders. Some authors assert that they kept dogs on purpose to devour such as arrived at extreme old age, or who were exhausted by long sickness. They add, that for all their fierceness, the Bactrian husbands were such dupes to their wives, that they durst not complain of them even for conjugal infidelity, to which it seems the latter were very much addicted.

BACURIUS, or BATURUS, king of the Iberians, a people on the side of the Caspian sea. One day being a-bunting, he lost sight of his company, through a great storm and sudden darkness; upon which he vowed to the God of his Christian slave, that if he were delivered he would worship him alone: the day breaking up immediately, he made good his promise, and became the apostle of his country.

BADCOCK (Samuel), was the son of a creditable butcher at South Molton in Devonshire, where he was born about the year 1747. All his friends being dissenters, he was designed by them for the ministerial function, and after receiving the rudiments of education at his native town, was placed in an academy set apart for the training up candidates for the dissenting ministry, we believe at St. Mary's Ottery, in the same county; and from thence he was transplanted to an higher seminary, at Taunton. On leaving the academy, he preached occasionally as a probationer, and after some small time was ordained pastor to a congregation of dissenters of the Independent persuasion, at Bere Regis in Dorsetshire. From thence he was invited to Barnstaple in Devon, whither he removed about 1767, and continued there nine or ten years.

While at Barnstaple, he met with some of Dr. Priestley's theological productions, which so mightily charmed him, that he paid a visit to the doctor at Caln in Wiltshire, and established an intimacy and correspondence with him. Unfortunately, however, for the cause of Socinianism, Mr. Badcock had a mind too deep and penetrating to be long satisfied with mere empty sounds and shewy pretences. He read much, and he read with judgment; and as his reading was confined pretty much to ecclesiastical history, and the writings of the more ancient fathers, he soon discovered the source of Socinianism to be so far from commencing at the primitive ages of Christianity, that it was nothing more than a polished assemblage of almost every heresy that has peiiled the church. From Barnstaple he removed to South Molton, the dissenting congregation of which place readily accepted his ministry. This was about 1777. The number of dissenters there being but few, his stipend was consequently but very small; and had it not been for the kindness of friends, many of them persons of distinguished rank, who properly valued his great merit and eminent talents, his situation must have been exceedingly irksome. About 1780 he engaged as a writer in the Monthly Review, though he had before been a contributor to periodical publications. In the year 1780, when the great controversy concerning the materiality or immateriality of the human soul was warmly agitated by Dr. Priestley, Dr. Price, and other metaphysicians, Mr. Badcock also published a pamphlet upon the subject; one of the least, indeed, in size, though one of the first in merit. It was entitled, A slight Sketch of the Controversy between Dr. Priestley and his Opponents, &c. This tract was shrewd, and discovered the author to be deeply acquainted with his subject; and it was quoted by very respectable writers, with marks of high approbation.

In 1781 he distinguished himself as the reviewer and opponent of the late Mr. Martin Madan's weak but popular *Thelyphthora*. In this controversy Mr. Badcock evinced a

remarkable force of genius, skill of argument, and display of learning; and justly engaged the attention and admiration of the public upon his criticisms. In the same year he also wrote a poem entitled, *The Hermitage*.

In the Chattertonian controversy, or rather the controversy concerning the authenticity of Rowley's poems, Mr. Badcock took a considerable part in his capacity of reviewer. Whether he was on the right side of the question, he being an Anti-Rowleyian, is not for us to determine; certain it is, however, that his elucidations were ingenious, and that he was far from being the least of the formidable group who assailed the pretensions of the Bristol priest.

On the publication of Dr. Priestley's History of the Corruptions of Christianity, Mr. Badcock undertook the refutation of that part which was the most laboured and important of the whole work, viz. The History of Opinions relative to Jesus Christ. This he accordingly did in the Monthly Review for 1783. His critique was long, but smart, and shewed an uncommon extent of reading in the ancient fathers, ecclesiastical history, and the Socinian writers. Dr. Priestley felt this attack so severely, and especially as it was made from a quarter so unexpected as the Monthly Review, that with his usual celerity, in less than a month, he published, A Reply to the Animadversions, though the remainder of the critique upon his work had not yet appeared. When he published this Reply he did not know who his antagonist was, and therefore, unbiassed by prejudice, and untouched with resentment, he bestowed this eulogium on him: "The knowledge and ability of the present reviewer makes him a much more formidable, and therefore a more respectable, antagonist."

In the Review for September, 1783, Mr. Badcock gave a complete examination, and, as hath been generally thought, a complete refutation, both of the doctor's history, and the above-mentioned defence of it. This critique is, indeed, a masterly performance, and searches all the doctor's arguments for his favourite cause to the very bottom.

When Dr. White was appointed Bampton lecturer in Easter term, 1783, in order to complete the lectures on the plan he had formed, he found it expedient to avail himself of the best aid he could procure. This made him turn his attention to Mr. Badcock, and about November following he paid him a visit at South Molton, for the purpose of soliciting his assistance in the formation of a work that should be worthy the attention of the public. Mr. Badcock undertook his part with alacrity, executed it speedily, and in a manner that will immortalise his name. The parts allotted to, and written by Mr. Badcock, are, the greatest share of Lecture the First, the best part of Lecture the Third, about a fourth of Lecture the Fifth, almost the whole of Lecture the Seventh, and a small part of Lecture the Eight. Of the notes appended to the lectures, Mr. Badcock is acknowledged to have furnished about one fourth.

Mr. Badcock quitted the dissenting ministry some time toward the end of the year 1786, having an intention of conforming to the established church, to which he was reconciled, as he declared, by observing the parity between it and the primitive ages of Christianity.

In the spring of 1787 he was ordained in Exeter cathedral by Bishop Rotz; and it is certain that his ordination was distinguished by the following particulars:—He was not examined; he received the order of deacon one Sunday, and that of priest the Sunday following. When Mr. Badcock intimated that he neither expected nor desired such marks of distinction, the bishop's reply was, "I choose to distinguish you." The title upon which he was ordained was the curacy of Broad Clyst, near Exeter.

On account of his repeated and violent head-achs, he was

obliged shortly after to resign the curacy upon which he was ordained, and then engaged himself as assistant to Dr. Gabriel, of the Octagon Chapel, Bath. He there preached a charity sermon, which was afterwards printed, but not published. At the last office, 1788, he preached in the cathedral of Exeter, before the judges, a sermon which was much admired by those who heard it. May the 19th following he died of a bilious complaint, at the house of his affectionate and worthy friend, Sir John Chichester, baronet, in Queen-street, Mayfair.

His disposition was gentle, humane, and lively; his judgment acute and comprehensive. His school education was very confined, but his own attainments were wonderfully great and various. There was scarcely a subject but he was in some degree acquainted with, nor any branch of literature that he had entirely neglected. As a writer, the public have borne the most honourable testimony to his excellence; as a preacher, it was an unhappiness not to have heard him.

Besides the pieces already noticed of Mr. Badcock's composition, he was the author of some curious memoirs of the family of the celebrated Mr. John Wesley, and several other fugitive pieces. He had also engaged in, and began, the history of his native country; but did not live to complete it.

BADEN (*Encycl.*), the capital of the district of that name, is an agreeable city, moderately large, seated on the side of the Limmet, in a plain flanked by two high hills, between which the river runs. This city owes its rise to its baths, which were famous before the Christian æra. Several monuments of antiquity have been found here from time to time, particularly in 1420. When they were opening the large spring of the baths, they found statues of several heathen gods, made of alabaſter; Roman coins, made of bronze, of Augustus, Vespasian, Decius, &c.; and several medals of the Roman emperors, of gold, silver, copper, and bronze. There are two churches in Baden; one of which is collegiate, and makes a good appearance; the other is a monastery of the Capuchins, near the town-house. This last building serves not only for the assemblies of their own council, but also for those of the cantons. The diet assemblies there in a handsome room made for that purpose; the deputies of Zurich sit at the bottom behind a table, as the most honourable place; the ambassadors of foreign powers are seated on one side to the right, and the deputies of the other cantons are ranged on each side the room. The bailiff of Baden resides in a castle at the end of a handsome wooden bridge, which is covered in. Before this castle there is a stone pillar, erected in honour of the Emperor Trajan, who paved a road in this country eighty-five Italian miles in length. The inhabitants are rigid Roman-catholics, and formerly behaved in a most insolent manner to the Protestants, but they are now obliged by their masters to be more submissive. The baths which are on each side the river are a quarter of a league from the city. Joining to the small baths there is a village, and to the large a town which may pass for a second Baden. It is seated on a hill, whose ascent is steep. There the baths are brought into inns and private houses, by means of pipes, which are about sixty in all. There are also public baths in the middle of the town, from a spring which rises in the street, where the poor bathe gratis, but they are exposed quite naked to all that pass by. All the baths are hot, and one to so great a degree as to scald the hand; and they are impregnated with a great deal of sulphur, with some alum and nitre. They are useful for drinking as well as bathing; and are said to cure all diseases from a cold cause, head-achs, vertigos, &c. They strengthen the senses, cure diseases of the breast and bowels, asthma, and obstructions. They are peculiarly excellent for women's diseases. E. long. 8. 25. N. lat. 47. 27.

BADENOCH, the most northerly part of Invernesshire, in Scotland, extending about thirty-three miles in length from east to west, and twenty-seven from north-east to south-west where broadest. It has no considerable town, and is very barren and hilly, but abounds with deer, and other kinds of game.

BADREW (Richard de), the first and original founder of Clare-hall, in Cambridge, was descended from a knightly family seated at Great Badew, or Badow, near Chelmsford, in the county of Essex. From this place of their residence they took their surname; and here, probably, Richard de Badew was born. In 1326 he was chancellor of the university of Cambridge; and having purchased two tenements in Miln-street, of Nigel Thornton, a physician, he laid there, in the year above mentioned, the foundation of a building, to which was given the name of University-hall. In it he placed a principal, who was to take care of the pensioners that came to live there. It continued in this condition for the space of sixteen years, and then by an accidental fire was burnt down. Richard de Badew being unable to rebuild it, it lay for a few years in ruins; but one of the late pensioners having a great interest with Elizabeth, daughter of Sir Gilbert de Clare, earl of Gloucester, and third sister and coheir of Sir Gilbert de Clare, the last earl of Gloucester and Hertford, he prevailed upon her to undertake what de Badew was not able to perform. Whereupon this charitable lady, after the resignation of Walter Thaxted, the principal, and with the consent of Richard de Badew, new built that hall, and endowed it, in the year 1347, with revenues for one master, ten fellows, and ten scholars. At the same time she named it Clare-hall, from her own family surname.

BADGEWORTH, a village of Gloucestershire, noted for a spring of mineral water, called Cold Pool, nearly the same in property as those of Cheltenham. From the hill, above Crickley, is a very extensive prospect. It is three miles from Cheltenham.

BADIA, an ancient town of Bætica on the Anas; now supposed to be *Badajoz* on the Guadiana.

BADIUS (Conrad), and (Stephen Robert), his brother; French refugees; celebrated as printers at Geneva, and Conrad as an author. The latter died in 1566.

BÆCKEA (*Encycl.*). Correct a botanical error, by substituting the clais for the order, and vice versa.

BÆTERRÆ, an ancient town of the Tertifages in Gallia Narbonensis; now *Befers*, on the east bank of the Obrie, now *Orbis*, or *Orbe*, in Lower Languedoc.

BÆTICA, a province of ancient Spain, so called from the famed river Bætis, afterwards *Artessus*, now *Guadalquivir*, or the great river. It was bounded on the west by Lusitania; on the south, by the Mediterranean, and Sinus Gaditanus; on the north, by the Cantabricæ, now the Bay of Biscay. On the east and north-east, its limits cannot be so well ascertained, as they are very reasonably thought to have been in a continual state of fluctuation, as each petty monarch had an opportunity of encroaching upon his neighbour. The province was divided in two by the river Bætis already mentioned. On the one side of which, towards the Anas, were situated the Turdetani, from whence the kingdom was called *Turdetania*, though more generally known by the name of *Bæticia*. On the other side were situated the Bæfali, Bæfietani, and Contestani, along the Mediterranean coasts. The Bæfali were supposed to be of Phœnician extract, and dwelt along the coasts of the Mediterranean, till, driven from thence by the Moors, they fled into the mountainous parts of Galicia, which they then called from their own name *Bæfidia*. The Bæfietani were seated higher up, on the same coasts. The territories of both these made part of what has since become the kingdom

of *Granada*; in which there is a ridge of very high mountains, called, from the above-mentioned people, the *Baſſetanian mountains*. Mention is alſo made of their capital *Baſſetana*; a place of ſuch ſtrength, that King Ferdinand was fix months beſieging it before he could take it from the Moors.—The whole province of *Bætica*, according to the moſt probable account, contained what is now called *Andaluſia*, part of the kingdom of *Grenada*, and the outward boundaries of *Eſtrema-dura*.

BÆTIS. See *BÆTICA*.

BETULO, a town of ancient Spain, in the *Terraconenſis*; now *Badellona* in Catalonia.

BAGAMADER, or *BAGAMEDRI*, a province of the kingdom of *Abyſſinia* in *Africa*. It is ſaid to receive its name from the great number of ſheep bred in it; *meder* ſignifying land or earth, and *bag* a ſheep. Its length is eſtimated about ſixty leagues, and its breadth twenty; but formerly it was much more extenſive; ſeveral of its provinces having been diſmembered from it, and joined to that of *Tigre*. A great part of it, eſpecially towards the eaſt, is inhabited by wandering *Gallas* and *Caffres*.

BAGFORD (John), the antiquary, and great collector of old *English* books, prints, &c. was born in London. He had been in his younger days a ſhoemaker, afterwards a bookſeller; and laſtly, for the many curioſities wherewith he enriched the famous library of Dr. John Moore, biſhop of *Ely*, his lordſhip got him admitted into the Charter-houſe. He was ſeveral times in *Holland*, and in other foreign parts, where he procured many valuable old books, prints, &c. ſome of which he diſpoſed of to the late earl of *Oxford*, who, after his death, purchaſed all his collections, papers, &c. for his library. In 1707 were published, in the *Philophical Tranſactions*, his propoſals for a General Hiſtory of Printing. He died at *Illington*, a little before fix in the morning, May 15, 1716, aged ſixty-five years; and was buried the Monday following, in the cemetery belonging to the Charter-houſe. In 1728 a print was engraved of him, from a painting of Mr. Howard, by George Vertue. An account of his entries, which were deſigned for a General Hiſtory of Printing, is in the Catalogue of the *Harleian Collection* of MSS. vol. II. fol. London, 1759, from No. 5892 to No. 5910. His MSS. may be of uſe to ſuch as will take pains to extract good matter from a bad hand, and worſe orthography. This may be eaſily forgiven to his education, far from learned, and all his improvements owing to the ſtrength of genius, ſeconded by unuſual diligence and induſtry. A number of his letters to *Humphry Wanley* may be ſeen in the *British Muſeum*; and a large part of his collections is in the public library at *Cambridge*, where they are locked up in a large cubical deal box, and probably have never been opened ſince they were placed there.

BAHAR, a country of *Hindoſtan Proper*, bounded on the W. by *Allahabad* and *Oude*, on the N. by *Napanal*, on the E. by *Bengal*, and on the S. by *Oriffa*. It is ſubject to the *English Eaſt-India Company*; and moſt of the ſaltpetre they export is manufactured in this province, of which *Patna* is the capital.

BAJAZET I. Sultan of the *Turks*, a renowned warrior, but a tyrant, was conquered by *Tamerlane*, and expoſed by him in an iron cage; the fate he had deſigned for his adverſary if he had been the victor. He daſhed his head againſt the bars of this priſon, and killed himſelf, in 1413. See the article *TURKS*.

BAILLET (Adrian), a very learned French writer and critic, born in 1649, at the village of *Neuville* near *Beauvais* in *Picardy*. His parents were too poor to give him a proper education, which however he obtained by the favour of the

biſhop of *Beauvais*, who afterward preſented him with a ſmall vicarage. In 1680 he was appointed librarian to M. de *Lamoignon*, advocate general to the parliament of *Paris*; of whoſe library he made a copious index in 35 vols. folio, all written with his own hand. He died in 1706, after writing many works, the principal of which are, *A Hiſtory of Holland from 1609, to the Peace of Nimwegen in 1679*, 4 vols. 12mo; *Lives of the Saints*, 3 vols. folio, which he profeſſed to have purged from fables; *Judgements des Savans*, which he extended to 9 vols. 12mo; and *The Life of Des Cartes*, 2 vols. 4to, which he abridged, and reduced to 1 vol. 12mo.

BAILLIE (Robert), a preſbyterian divine in the church of Scotland during the laſt century, was born at *Glaſgow*, in the year 1599. He was educated in the univerſity of his native city, under the direction of Mr. Sharp, who was at that time the head of the college there. After Mr. Baillie had taken his degrees in arts, he turned his thoughts to the ſtudy of divinity, to which he applied with uncommon diligence. Having about the year 1622 received orders from Archbiſhop *Law*, he was choſen a regent of philoſophy in the univerſity of *Glaſgow*. While he was in this ſtation, he had, for ſome years, the care of the education of Lord *Montgomery*, who, at length, carried him with him to *Kilwinning*; to which church he was preſented by the Earl of *Eglinton*. Here he lived in the ſtriſteſt friendſhip with that noble family, and the people connected with it; as he did, alſo, with his ordinary the Archbiſhop of *Glaſgow*, with whom he kept up an epistolary correſpondence. In 1633 he declined, from a principle of modeſty, an offer which was made him of a church in *Edinburgh*. In 1638 he was choſen, by the preſbytery of *Irvine*, a member of the famous aſſembly at *Glaſgow*, which was a prelude to the civil war. Though Mr. Baillie is ſaid to have behaved in this aſſembly with great moderation, it is evident that he was by no means deficient in his zeal againſt prelacy and arminianiſm. He was a member of all the following general aſſemblies, till 1653, excepting the time in which he attended the *Westminster aſſembly*. In 1640 he was ſent by the covenanting lords to London, to draw up an accuſation againſt Dr. *Laud*, archbiſhop of *Canterbury*, for the innovations he had obtruded upon the church of Scotland, While Mr. Baillie was in England upon this occaſion, he wrote to the preſbytery of *Irvine* a regular account of the ſtate of public affairs; and ſent them, among other things, a large journal of the proceedings in the trial of the Earl of *Stafford*. Not long after his return to his own country (in 1642), he was appointed joint profeſſor of divinity, with Mr. *David Dickſon*, in the univerſity of *Glaſgow*. And his reputation was become ſo great, that he had before this received invitations from the other three univerſities, all of which he reſuſed. He continued in his profeſſorſhip till the *Reſtoration*; but his diſcharge of the duties of it was interrupted, for a conſiderable time, by his reſidence in England; for in 1643 he was choſen one of the commiſſioners of the church of Scotland to the aſſembly of divines at *Westminster*. Mr. Baillie returned again to his own country in the latter end of the year 1646. When, after the execution of *Charles the Firſt*, *Charles the Second* was proclaimed in Scotland, our profeſſor was one of the divines appointed by the general aſſembly to wait upon his majeſty at the *Hague*; upon which occaſion, on the 27th of March, 1649, he made a ſpeech in the royal preſence, wherein he expreſſed, in the ſtrongeſt terms, his abhorrence of the murder of the late king; and, in his ſentiments upon this event, it appears, that the preſbyterian divines of that period, both at home and abroad, almoſt univerſally agreed. After the reſtoration of King *Charles the Second*, Mr. Baillie, on the 23d of January, 1661, by the intereſt of the Earl of

Lauderdale, with whom he was a great favourite, was made principal of the university of Glasgow, upon the removal of Mr. Patrick Gallepie, who had been patronized by Cromwell. It is said, by several writers, that Mr. Baillie had the offer of a bishopric, which he absolutely refused. Though he was very loyal, and most sincerely rejoiced in his majesty's restoration, he began, a little before his death, to be extremely anxious for the fate of his beloved presbytery. His health failed him in the spring of the year 1662, and he died in July, the same year, aged sixty-three.

BAINBRIDGE (Dr. John), an eminent physician and astronomer, born at Athby de la Zouch in Leicestershire, in 1582. He taught a grammar-school for some years, and practised physic, employing his leisure hours in astronomy, which was his favourite study: at length he removed to London, was admitted a fellow of the college of physicians, and raised his character by his description of the comet in 1618. The next year Sir Henry Savile appointed him his first professor of astronomy at Oxford; and the masters and fellows of Merton College made him first junior, and then superior, reader of Linacre's lecture. He died in 1643, having written many works, some of which have never been published: but the MSS. are preserved in the library of Trinity College, Dublin.

BAIN GONGA, or BAIN RIVER, a large river of Hindoostan, which rises near the S. bank of the Nerbudda, runs fourthward through the heart of Berar, and, after a course of near 400 miles, unites with the Godavary, within the hills that bound the British Northern Circars.

BAKER (Thomas), an eminent mathematician, was born at Iton in Somersetshire, about the year 1625, and entered at Magdalen-hall, Oxon, in 1640; after which he was vicar of Bishop's-Nymmet in Devonshire, where he wrote *The Geometrical Key*, or *the Gate of Equations unlocked*; by which he gained a considerable reputation. A little before his death, the members of the Royal Society sent him some mathematical queries, to which he returned so satisfactory an answer, that they presented him a medal, with an inscription full of honour and respect. He died at Bishop's-Nymmet, on the 5th of June, 1690.

BAKER (Thomas), a dramatic writer, was the son of an eminent attorney in the city of London. His turn was entirely to comedy, and his plays are five in number, viz. 1. *Act at Oxford*. 2. *Fine Ladies' Airs*. 3. *Hampstead Heath*. 4. *Humours of the Age*. 5. *Tunbridge Walks*. All of them have a considerable share of merit; yet only one among the number stands on the present list of acting plays, viz. *Tunbridge Walks*. It is said that the character of Maiden in this play, which is perhaps the original of almost all the Fribbles, bear Mizens, &c. that have been drawn since, and in which effeminacy is carried to an height beyond what any one could conceive to exist in any man in real life, was absolutely, and without exaggeration, a portrait of the author's own former character; whose understanding having at length pointed out to him the folly he had so long been guilty of, he reformed it altogether in his subsequent behaviour, and wrote this character, in order to set it forth in the most ridiculous light, and warn others from that rock of contempt which he had himself for some time been wrecked upon. Whether this gentleman's attachment to the muffs drew him from any application to business, or from what other cause, is not known; but during the latter part of his life he stood on indifferent terms with his father, who allowing him a very scanty income, he was obliged to retire into Worcestershire, where he is reported to have died of that loathsome disorder the *morbis pediculofus*.

BAKER (Henry), an ingenious and diligent naturalist, was

born in Fleet-street, London, either near the end of the last, or very early in the beginning of the present, century. His father's profession is not known; but his mother was, in her time, a midwife of great practice. He was brought up, under an eminent bookeller who preceded the elder Dodley, to the business of a bookseller, in which, however, he appears not to have engaged at all after his apprenticeship; or, if he did, it was soon relinquished by him: for though it was in his power to have drawn away all his master's best customers, he would not set up against him. Mr. Baker being of a philosophical turn of mind, and having diligently attended to the methods which might be practicable and useful in the cure of stammering, and especially in teaching deaf and dumb persons to speak, he made this the employment of his life. In the prosecution of so valuable and difficult an undertaking, he was very successful; and several of his pupils, who are still living, bear testimony to the ability and good effect of his instructions. He married Sophia, youngest daughter of the famous Daniel Defoe, who brought him two sons, both of whom he survived. On the 29th of January, 1740, Mr. Baker was elected a fellow of the Society of Antiquaries; and, on the 12th of March following, the same honour was conferred upon him by the Royal Society. In 1744 Sir Godfrey Copley's gold medal was bestowed upon him, for having, by his microscopical experiments on the crystallizations and configurations of saline particles, produced the most extraordinary discovery during that year. This medal was presented to him by Sir Hans Sloane, late president of the Royal Society, and only surviving trustee of Sir Godfrey Copley's donation, at the recommendation of Sir Hans's worthy successor, Martin Folkes, esq. and of the council of the said society. Having led a very useful and honourable life, he died at his apartments in the Strand, on the 25th of November, 1774, being then about seventy years of age.

Several of Mr. Baker's communications are printed in the *Philosophical Transactions*; and, besides the papers written by himself, he was the means, by his extensive correspondence, of conveying to the society the intelligence and observations of other inquisitive and philosophical men. Mr. Baker was a poetical writer in the early part of his life. His *Invocation of Health* got abroad without his knowledge: but was reprinted by himself in his *Original Poems, Serious and Humorous*, part the first, 8vo. 1725. The second part came out in 1726. Among these poems are some tales as witty and as loose as Prior's. He was the author, likewise, of *The Universe*, a Poem, intended to refrain the *Pride of Man*; which has been several times reprinted. His account of the water polype, which was originally published in the *Philosophical Transactions*, was afterwards enlarged into a separate treatise, and hath gone through several editions. But his principal publications are, *The Microscope made Easy*, and *Employment for the Microscope*.

His eldest son, David Erskine Baker, was a young man of genius and learning. Having been adopted by an uncle, who was a silk-throwster in Spital-fields, he succeeded him in the business; but wanted the prudence and attention which are necessary to secure prosperity in trade. Like his father, he was both a philosopher and a poet; and wrote several occasional poems in the periodical collections. The public was indebted to him for *The Companion to the Playhouse*, in two volumes, 1764, 12mo; a work which, though imperfect, had considerable merit, and shewed that he possessed a very extensive knowledge of our dramatic authors.

BALAMIO (Ferdinand), of Sicily, was physician to Pope Leo X.; who greatly regarded him. He was no less skilled in the belles lettres than in medicine; and he cultivated poetry

and the Greek learning with much success. He translated from the Greek into Latin, several pieces of Galen; which were first printed separately, and afterwards inserted in the works of that ancient physician, published at Venice, 1586, in folio. He flourished at Rome about the year 1555.

BALARUC, a town of France, near the road from Montpellier to Toulouse; famous for its baths.

BALANUS, in zoology, the trivial name of a species of lepus. See *LEPUS*.

BALASORE, a seaport to the N.W. of the bay of Bengal, four miles from the sea by land, but by the rivers twenty. The inhabitants make stuffs of silk, cotton, and a sort of galls. It is 180 miles S.W. of Hoogly. Long. 87. 1. E. Lat. 21. 20. N.

BALBUS (Lucius Cornelius Theophanes), was born at Cadiz, and distinguished himself by his valour in the war carried on by the Romans in Spain against Sertorius and the Lusitanians, on which account Pompey gave him the privileges of a Roman citizen. He was consul in the 714th year of Rome, and was the first foreigner on whom that dignity was conferred. He was the friend of Pompey, Cæsar, Crassus, and Cicero.—There were many other illustrious Romans of the name of *Balbus*.

BALCH, a town of Ubec Tartary, in Asia, on the frontiers of Persia, 200 miles S. of Bokhara. Long. 69. 0. E. Lat. 37. 20. N.

BALDINUCCI (Philip), of Florence; a connoisseur in the polite arts, and the continuator of Vasar's lives of the painters. He died in 1696, aged seventy-two.

BALDOCK (Ralph de), bishop of London in the reigns of Edward I. and II. was educated at Moreton College, in Oxford; became dean of St. Paul's; was afterwards promoted to the see of London; and at last was made lord high-chancellor of England. He had a very amiable character both for morals and learning; and wrote *Historia Anglicæ*, or An History of the British Affairs down to his own Time; and A Collection of the Statutes and Constitutions of the church of St. Paul. Bishop Baldock died at Stepney, July 24th, 1313.

About the same time there was a **ROBERT DE BALDOCK**, a canon of London, and archdeacon of Middlesex, who, upon the vacancy of the see of London by the death of Bishop Baldock, was (together with John Colchester, another canon) presented by the chapter of London to the chapter of Canterbury, that see being likewise vacant, for the choice of one of them to be official for the diocese of London. This Robert Baldock was in great favour with King Edward II. who made him his chancellor, and nominated him to the bishopric of Norwich, into which he was elected about the middle of the year 1325, and confirmed by the archbishop in the month of August; but he could not obtain the fee, by reason of a papal provision in favour of William de Ayremin. Soon after, he lost his liberty and life by the national commotions, which deprived King Edward of his crown; for, being seized by the enraged populace, he was dragged to the prison of Newgate, where he died in a most wretched condition.

BALDWIN, archbishop of Canterbury, was born of obscure parents at Exeter, where, in the early part of his life, he taught a grammar-school; after which he took orders, and was made archdeacon of Exeter: but he resigned that dignity, and became a Cistercian monk in the monastery of Ford in Devonshire, of which in a few years he was made abbot. In the year 1180 he was consecrated bishop of Worcester. In 1184 he was promoted to the see of Canterbury by Pope Lucius III. and by his successor Urban III. was appointed legate for that diocese. He laid the foundation of a church and monastery in honour of Thomas Becket, at Hackington, near Canterbury, for secular priests; but, being opposed by the

monks of Canterbury and the pope, was obliged to desist. In 1190 he crowned King Richard I. at Westminster; and soon after followed that prince to the Holy Land, where he died at the siege of Ptolemais. Giraldus Cambrensis, who accompanied him in this expedition, says he was of a mild disposition, and of great abstinence. He wrote various tracts on religious subjects, which were collected and published by Bertrand Tiffier in 1662.

BALE (John), bishop of Ossory in Ireland, was born at Cove, near Dunwich, in Suffolk, in the year 1495. At twelve years of age he was entered in the monastery of Carmelites at Norwich, and was thence sent to Jesus College in Oxford. He was educated a Roman-catholic, but was converted to the Protestant religion by Thomas lord Wentworth. On the death of Lord Cromwell, favourite of Henry VIII. who protected him from the persecutions of the Romish clergy, he was obliged to retire into the Low-countries, where he continued eight years. Soon after the accession of Edward VI. he was recalled; and being first presented to the living of Bishop's-Stocke in Hampshire, in 1552, he was nominated to the see of Ossory. During his residence in Ireland he was remarkably assiduous in propagating the Protestant doctrines; but to very little purpose, and frequently at the hazard of his life. Once, in particular, they murdered five of his domestics, who were making hay in a meadow near his house; and would probably have done the same by him, if the sovereign of Kilkenny had not come to his assistance with 200 horse and 300 foot. On the accession of Queen Mary, the tide of opposition became so powerful, that, to avoid assassination, he embarked for Holland, but was very unfortunate in his escape. First he was taken by a Dutch man-of-war, and robbed by the captain of all his effects. Then, being forced by fires of weather into St. Ives in Cornwall, he was confined on suspicion of treason. Being however released after a few days' confinement, the ship anchored in Dover road, where he was again seized on a false accusation. After his arrival in Holland, he was kept prisoner for three weeks, and at length obtained his liberty on paying 30*l*. From Holland he travelled to Basil in Switzerland, where he continued till Queen Elizabeth ascended the throne. After his return to England, he was, in 1560, made prebendary of Canterbury, probably not choosing to return to his former flock of wolves. He died in November 1563, at Canterbury, in the 68th year of his age. He was so severe a writer against the church of Rome, that his books are particularly prohibited in the expurgatory index published at Madrid, in folio, in the year 1667. He is the earliest dramatic writer in the English language, or at least author of the first pieces of that kind that we find in print. Of his writings in that way, no fewer than twenty-one have been enumerated; only three of them, however, have been seen in print, *viz.* 1. God's Promises, an interlude; 2. St. John Baptist, an interlude; 3. Concerning the Laws of Nature corrupted: the first of which has been reprinted by Doddsley in the first volume of his collection of old plays, and the only copy extant of the last is preserved in St. Sepulchre's library in Dublin. As to the rest, they are mentioned by himself, as his own, in his account of the writers of Britain before mentioned.—He also translated the tragedies of Pammachius.—His other works are very numerous; but the chief is his Catalogue of British authors: a book of some merit, as it contains some information which is not elsewhere to be found; but he has destroyed his credit by his intemperate Billingsgate abuse of all those who differed from him in religion. The authentic part of his work is transcribed from Leland. The title of it is, *Illustratio Majoris Britannicæ scriptorum Catalogus, a Jupetro sanctissimi Noab filio ad an. Dom.* 1557.

BALEARIC ISLANDS, the ancient name of the islands Majorca, Minorca, and Ivica, in the Mediterranean. See MAJORCA, &c.

BALES (Peter), was a most famous master in the art of penmanship, or fair writing, and one of the first inventors of short-hand. He was born in 1547, and is styled by Anthony Wood "a most dexterous person in his profession, to the great wonder of scholars and others." He is recorded for his skill in micrography, or miniature writing, in Hollinshed's chronicle, anno 1575; and Mr. Evelyn also hath celebrated his wonderful skill in this delicate operation of the hand. "Hadrian Junius speaking as a miracle of somebody who wrote the Apollie's Creed, and the beginning of St. John's Gospel, within the compass of a farthing; what would he have said," says Mr. Evelyn, "of our famous Peter Bales, who, in the year 1575, wrote the Lord's Prayer, the Creed, Decalogue, with two short prayers in Latin, his own name, motto, day of the month, year of the Lord, and reign of the queen, to whom he presented it at Hampton Court, all of it written within the circle of a single penny, incased in a ring and borders of gold, and covered with a crystal so accurately wrought, as to be very plainly legible, to the great admiration of her majesty, the whole privy-council, and several ambassadors then at court?" He was farther very dexterous in imitating hand-writing, and about 1586 was employed by Secretary Walsingham in certain political manœuvres. We find him at the head of a school, near the Old Bailey, London, in 1590; in which year he published his Writing Schoolmaster, in three parts; the first teaching swift writing, the second true writing, the third fair writing. In 1595 he had a great trial of skill, in the Black Friars, with one Daniel Johnson, for a golden pen of 20 l. value, and won it; and a contemporary author farther relates, that he had also the arms of calligraphy given him, which are, Azure, a Pen, Or, as a prize, at a trial of skill in this art among the best penmen in London. In 1597 he republished his Writing Schoolmaster, which was in such high reputation, that no less than eighteen copies of commendatory verses, composed by learned and ingenious men of that time, were printed before it.

BALEY (Walter), the son of Henry Baley of Warnwell in Dorsetshire, was born at Pottham in the same county, and educated at Winchester-school. From thence he was sent to Oxford; and, after two years' probation, was admitted perpetual fellow of New College in the year 1550. Having taken his degrees in arts, he practised physic, and in 1558 was proctor of the university. About this time he obtained a prebend of Wells, which he resigned in 1579. In the year 1561 he was appointed queen's professor of physic, in 1563 proceeded doctor in that faculty, and afterwards became one of her majesty's physicians in ordinary. He was thought skilful in his profession, and had considerable practice. He died in 1592, aged sixty-three; and was buried in the inner chapel of New college. His works are, 1. *A Discourse of three Kinds of Pepper in common Use*, 1588, 8vo. 2. *Brief Treatise of the Preservation of the Eye sight*. First printed in the reign of Elizabeth, in 12mo; afterwards at Oxford in 1616, and 1654, 8vo. 3. *Directions for Health, natural and artificial; with Medicines for all Diseases of the Eyes*, 1626, 4to. 4. *Explicatio Galeni de potu convalescentium et Jejunii*, &c. Manuscript, formerly in Lord Aylebury's library.

BALGUY (John), an eminent divine of the church of England in the present century, was born on the 12th of August, 1686, at Sheffield in Yorkshire. His father, Thomas Balguy, was master of the free grammar-school in that place, and from him he received the first rudiments of his grammatical education. After his father's death, he was put under the instruction of Mr. Daubuz, who succeeded to the master-

ship of the same school, September 23, 1696, for whom he always professed a great respect. In 1702 he was admitted of St. John's College, Cambridge, under the care of Dr. Edmondson, and of Dr. Lambert, afterwards master of that college. He frequently lamented, in the succeeding part of his life, that he had wasted nearly two years of his residence there in reading romances; but at the end of that time he had the good fortune to meet with Livy, went through him with great delight, and from thence forward applied himself to serious studies. In 1705-6 he was admitted to the degree of bachelor of arts, and to that of master of arts in the year 1726. Soon after he had taken his bachelor's degree he quitted the university, and was engaged, for a while, in teaching the free-school at Sheffield; but whether he was ever chosen master, or only employed during a vacancy, does not appear. On the 15th of July, 1708, he was taken into the family of Mr. Banks, as private tutor to his son, Joseph Banks, esq. afterwards of Rereby, in the county of Lincoln, and grandfather of the celebrated Sir Joseph Banks, bart. so eminently distinguished for his skill in natural history, and the expences, labours, and voyages he has undergone to promote that part of science. Mr. Balguy, in 1710, was admitted to deacon's orders, by Dr. Sharp, archbishop of York; and in 1711 he was ordained a priest, by that prelate. By Mr. Banks's means he was introduced to the acquaintance of Mr. Bright of Badiworih, in the county of York; and was by him recommended to his father, Sir Henry Liddel, grandfather to the late Lord Ravensworth. In 1711 this gentleman, who lived at Ravensworth-castle, in the county of Durham, took Mr. Balguy into his family, and bestowed upon him the donative of Lamely and Tanfield, in that county. For the first four years after he had obtained this small preferment, he did not intermit one week without writing a new sermon; and all his sermons were of his own composition. Being desirous that so excellent an example should be followed by his son, he destroyed almost his whole flock, and committed, at one time, two hundred and fifty to the flames, most of which deserved to have been used in the best congregations. In July, 1715, he married Sarah, daughter of Christopher and Sarah Broomhead, of Sheffield. She was born in 1686, and by her he had only a son, Dr. Thomas Balguy, archdeacon of Winchester, who owed his archdeaconry, and all his other preferments, to the favour and friendship of Bishop Hoadly. In 1718 he published, without his name, *Silvius's Examination of certain Doctrines lately taught and defended by the Rev. Mr. Stebbing*; and in the following year, *Silvius's Letter to the Rev. Dr. Sherlock*. Both of these performances were written in vindication of Bishop Hoadly. Mr. Stebbing having written against these pamphlets, Mr. Balguy, in 1720, again appeared from the press, in the cause of the bishop, in a tract entitled, *Silvius's Defence of a Dialogue between a Papist and a Protestant, in Answer to the Rev. Mr. Stebbing*; to which are added, several Remarks and Observations upon that Author's Manner of Writing. This also being answered by Mr. Stebbing, Mr. Balguy had prepared a farther defence; but Dr. Hoadly prevailed upon him to suppress it, on account of the public having grown weary of the controversy. In 1726 he published *A Letter to a Deist, concerning the Beauty and Excellence of Moral Virtue, and the Support and Improvement which it receives from the Christian Revelation*. In this treatise he has attacked, with the greatest politeness, and with equal strength of reason, some of the principles advanced by the noble and celebrated writer of the *Characteristicks*, in his Enquiry concerning Virtue. On the 25th of January, 1727-8, Mr. Balguy was collated by Bishop Hoadly to a prebend in the church of Salisbury; among the advantages of which preferment, was the right of presenting to four livings,

and of presenting alternately to two others. The best of them did not fall in his life-time; but two small livings were disposed of by him; one to Mr. Robinson, who married his wife's sister, the other to his own son. In the year 1727, or 1728, he preached an assize sermon at Newcastle-upon-Tyne, the subject of which was party spirit. It was printed by order of the judges, and either inscribed or dedicated to Dr. Talbot, bishop of Durham. The Foundation of Moral Goodness; or a farther Enquiry into the Original of our Idea of Virtue, was published by him in 1728. In the same year he published The Second Part of the Foundation of Moral Goodness; illustrating and enforcing the Principles and Reasonings contained in the former: being an Answer to certain Remarks communicated by a Gentleman to the Author. His next publication was, Divine Rectitude; or, A brief Enquiry concerning the Moral Perfections of the Deity; particularly in respect of Creation and Providence. This was followed by A Second Letter to a Deist, concerning a late Book, entitled, Christianity as old as the Creation. To this succeeded The Law of Truth, &c. In 1741 appeared Mr. Balguy's Essay on Redemption. This, and his volume of sermons, including six, which he had published before, were the last pieces committed by him to the press. A posthumous volume was afterwards printed, which contained almost the whole of the sermons he left behind him. He died on the 21st of September, 1748, in the 63d year of his age.

BALLOL, BALIOL, or BOILLIOL (John), the brother of Alexander king of Scotland, and competitor with Robert Bruce for that crown.

BALL (John), a puritan divine in the seventeenth century, was born in the year 1585, of an obscure family, at Caington, or Cherington, near Woodstock in Oxfordshire. He was educated in grammar learning at a private school, under the vicar of Yarnon, a mile distant from Caington; and was admitted a student of Brasen-nose College in Oxford, in 1602. He continued there about five years, in the condition of a fervitor, and under the discipline of a severe tutor; and from thence he removed to St. Mary's Hall, and took the degree of bachelor of arts in 1608. Soon after, he was invited into Cheshire, to be tutor to the Lady Cholmondeley's children; and here he became acquainted with some rigid puritans, who gained so far upon his affections, that he went over to their party. About this time, having got a sum of money, he came up to London, and procured himself to be ordained by an Irish bishop, without subscription. Soon after, he removed into Staffordshire, and became curate of Whitmore, a chapel of ease to Stoke. He has, among the puritan writers, the character of an excellent school-divine, a painful preacher, and a learned and ingenious author; and, though he was not well affected to ceremonies and church discipline, yet he wrote against those who thought these matters a sufficient ground for separation. He died the 20th of October, 1640, aged about fifty-five.

BALLARD (George), one of those singular compositions which shoot forth without culture, was born at Camden in Gloucestershire. Being of a weakly constitution, his parents put him to a habit-maker; and in this situation he mastered the Saxon language. The time he employed in learning it was stolen from sleep, after the labour of the day was over. Lord Chedworth, and the gentlemen of his hunt, who used to spend about a month of the season at Camden, heard of his fame, and generously offered him an annuity of 100l.; but he modestly told them, that 60l. were fully sufficient to satisfy both his wants and his wishes. Upon this he retired to Oxford, for the benefit of the Bodleian library; and Dr. Jenner, president, made him one of the eight clerks of Magdalen college. He was

VOL. X.

afterwards one of the university beadles, but died in June, 1755, rather young; which is supposed to have been owing to too intense application. He left large collections behind him, but published only Memoirs of British Ladies, who have been celebrated for their Writings or Skill in the learned Languages, Arts, and Sciences, 1752, 4to. He drew up an account of Camden church, which was read at the Society of Antiquaries, November 27, 1771.

BALLENDEN (Sir John), a Scottish poet, in the reign of James V. of Scotland, was descended from an ancient family in that kingdom. His father, Mr. Thomas Ballenden, of Auchinoul, was director to the chancery in the year 1540, and clerk register in 1541. Where our poet was educated, we are not informed; but from one of his poems we learn, that in his youth he had some employment at the court of King James V. and that he was in great favour with that prince. Having taken orders, and being created doctor of divinity at the Sorbonne, he was made canon of Ross, and archdeacon of Murray. He likewise obtained the place of clerk register, but was afterwards deprived of that employment by the factions of the times; however, in the succeeding reign, of Mary, he recovered that office; and was one of the lords of session. Being a zealous papist, he, in conjunction with Dr. Laing, was extremely assiduous in retarding the progress of the reformation; till at last, finding the opposition too powerful, he quitted Scotland, and went to Rome, where he died in the year 1550. He is generally esteemed one of the best Scottish poets of that age. His works are, 1. *The History and Chronicles of Scotland of Hector Boëtius (Boethius), translated by Mr. John Ballenden.* Edinb. 1536. This is not a mere translation, Ballenden having corrected several mistakes of his author, and made large additions. It is in folio, and black letter. 2. *Cosmography to the History of Scotland, with a poetical Proem.* 3. *A Description of Albany.* 4. *Translation of Boethius's Description of Scotland.* 5. *Epistles to King James V.* Bale says he had seen these letters. 6. Several Poems in Carmichael's collection of Scottish Poems; besides many others in manuscript, in private libraries in Scotland. 7. *Virtue and Vice*, a poem, addressed to King James V.

BALLERUS, in ichthyology, the trivial name of a species of cyprinus. See BARBEL.

BALLOGISTAN, LITTLE, a country of Hindoostan Proper, bordering on the N. of Mewat, and approaching within twenty-four miles of Delhi. It is eighty or ninety miles long, and from thirty to forty broad. Within this century it was seized by the Balloges, or Balloches, whose country adjoins to the W. bank of the Indus, opposite Moultran. They are represented as a very savage and cruel race. Their territory is full of ravines, and of course difficult of access. It has, however, been successively tributary to the Rohillas, the Jats, and the late Nudjuff Cawn. Westward it borders on the country of the Seiks.

BALNAVES (Henry), a Scottish protestant divine, born in the shire of Fife, in the reign of James V. and educated at the university of St. Andrews. He went afterwards to France in order to finish his studies; and, returning to Scotland, was admitted into the family of the Earl of Arnauld, who at that time governed the kingdom: but in the year 1532 the earl dismissed him for having embraced the protestant religion. In 1564 he joined, says Mackenzie, the murderers of Cardinal Beaton; for which he was declared a traitor, and excommunicated: Whilst that party were besieged in the castle of St. Andrews's, they sent Balnaves to England, who returned with a considerable supply of provisions and money; but being at last obliged to surrender

4 X

to the French, he was sent with the rest of the garrison to France. He returned to Scotland about the year 1559; and, having joined the congregation, he was appointed one of the commissioners to treat with the Duke of Norfolk, on the part of Queen Elizabeth. In 1563 he was made one of the lords of session, and appointed by the general assembly, with other learned men, to revise the Book of Discipline. Knox, his contemporary and fellow-labourer, gives him the character of a very learned and pious divine. He died at Edinburgh in the year 1570. He wrote, 1. *A Treatise concerning Justification*. Edinb. 1550, 8vo. 2. *A Catechism, or Confession of Faith*. Edinb. 1584, 8vo.

BALSHAM (Hugh de), or DE BEDESALE, or BELESALE, the tenth bishop of Ely, and founder of St. Peter's College, otherwise Peter-house, in Cambridge, was in all probability born at Balsham in Cambridgeshire (from whence he took his surname), towards the beginning of the thirteenth century. He was at first a monk, and afterwards sub-prior of the Benedictine monastery at Ely. In 1247, November 13, he was chosen, by his convent, bishop of Ely, in the room of William de Kikenny, deceased. But King Henry III. who had recommended his Chancellor Henry de Wingham, being extremely angry at the disobedience of the monks, refused to confirm the election; and, moreover, he sacked the woods, spoiled the ponds, and otherwise wasted the manors and estates belonging to the bishopric. He endeavoured at last to persuade the monks to proceed to a new election; alleging, that it was not fit to strong a place as Ely should be intrusted with a man that had scarcely ever been out of his cloister, and who was utterly unacquainted with political affairs. Balsham, finding he was not likely to succeed at home, went to Rome, in order to be confirmed by the pope; who, through the plenitude of his apostolical power, pretended to dispose of all ecclesiastical preferments in Christendom. In the mean time, Boniface archbishop of Canterbury used his utmost interest at Rome to obstruct Hugh de Balsham's confirmation, though he could allege no one fault against him; and recommended Adam de Maris, a learned Minorite friar, as a fit person to be promoted to the bishopric: but all his endeavours proved unsuccessful. As to Wingham, having been recommended by the king without his own desire and knowledge, he did not stir in the least to get himself elected by the monks; but rather, out of an uncommon excess of modesty, declined the honour, alleging that the two others (Balsham and Maris) were more worthy of it, and more deserving than himself. This matter remained in suspense for above ten years. And was at length determined in favour of Hugh de Balsham. For Wingham being promoted to the bishopric of London, upon Fulk de Balles's decease, the pope confirmed Hugh de Balsham's election, on the 10th of March, 1257, and he was consecrated the 14th of October following. Being thus fixed in his see, he applied himself to works of charity, and particularly, in the year 1257, or 1259 according to some, put in execution what he had designed, if not begun, before; that is, he laid the foundation of St. Peter's College, the first college in the university of Cambridge. He built it without Trumpington gate, near the church of St. Peter (since demolished), from whence it took its name. He died at Doddington, June 16, 1286, and was buried in the cathedral church of Ely.

BALTZAR (Thomas), a native of Lubeck, was an eminent musical composer, and esteemed the finest performer on the violin of his time. He came into England in the year 1658, and lived about two years in the house of Sir Anthony Cope, of Hanwell in Oxfordshire. He was the great competitor of Davis Mell, who, though a clock-

maker by trade, was, till Baltzar came hither, allowed to be the finest performer on the violin in England; and after his arrival he divided with him the public applause, it being agreed that Mell excelled in the fineness of his tone and the sweetness of his manner, and Baltzar in the power of execution and command of the instrument.—Moreover, it is said of the latter, that he first taught the English the practice of shifting, and the use of the upper part of the finger-board. Baltzar was given to intemperance, and is said to have shortened his days by excessive drinking: he was buried in Westminster-abbey on the 27th day of July, 1663.

BALUZE (Stephen), a French writer, born in 1631, and some time librarian to M. Colbert. In 1693 he obtained a pension, with the post of director of the royal college, for writing the lives of the Popes of Avignon; both which advantages he soon lost in the fluctuation of court parties. M. Baluze is much more noted for collecting ancient MSS. and illustrating them by notes, than famed for his own compositions.

BALZAC (John Lewes Guez de), born at Angoulême in 1595. Voltaire allows him the merit of having given numbers and harmony to the French prose, but censures his style as somewhat bombastic. The critics of his own time gave him no little disquiet; and he gave them no little advantage over him by his fallies of vanity, and some particular propositions which were a little dangerous. Mr. Balzac, getting rid of these disputes by his moderation, settled at his country-seat; refined his style and genius; and got by his letters and other writings which he published from time to time, the reputation of being the first writer in France. He was at length drawn from his retirement by the hopes of making his fortune under Cardinal Richelieu, who had formerly courted his friendship; but in a few years he retired again, disgusted with the slavish dependence of a court life. All he obtained from the court was a pension of 2000 livres, with the titles of counsellor of state and historiographer of France. He died in 1654; and was buried in the hospital of Notre Dame des Anges, to which he bequeathed 12,000 livres. He left an estate of 100 franks per ann. for a gold medal to be bestowed every two years for the best discourse on some moral subject.—Besides his letters, he wrote a work called *Oeuvres Diverses*, i. e. on various subjects; The Prince; The Christian Socrates, &c. and many other pieces; all of which have been published in two volumes folio.

BAMBRIDGE or BAINBRIDGE (Christopher), archbishop of York, and cardinal-priest of the Roman church, was born at Hilton, near Appleby, in Westmoreland, and educated at Queen's College, in Oxford. Having taken holy orders, he became rector of Aller, in the diocese of Bath and Wells. He enjoyed three prebends successively in the cathedral church of Salisbury; and that of South Grantham, in 1485; that of Chardstock in the same year, and that of Horton in 1486. He was elected provost of Queen's College in 1495, and about the same time created doctor of laws. On September the 28th, 1503, he was admitted prebendary of Strenhall, in the cathedral church of York, void by the consecration of Geoffrey Blyth to the see of Lichfield and Coventry; and on the 21st of December following, he was installed in the deanery of that church, in the room of the said Blyth. In 1505 he was made dean of Windsor, and the same year master of the rolls, and one of the king's privy-council. In 1507 he was advanced to the see of Durham, and received the temporalities the 17th of November. The next year he was translated to the archbishopric of York, and received the

temporalities the 12th of December. Pits assures us, that Bambridge had been very intimate with Morton archbishop of Canterbury, and shared in that prelate's sufferings during the usurpation of Richard III. after whose death, his affairs took a more prosperous turn; for he was appointed almoner to King Henry VII. and employed by that prince on several embassies to the Emperor Maximilian, Charles VIII. king of France, and other potentates of Europe. But he distinguished himself chiefly by an embassy from King Henry VIII. to Pope Julius II. who created him a cardinal, with the title of St. Praxedes, in March 1511, and, eight days after, appointed him legate of the ecclesiastical army, which had been sent into the Ferrarese, and were then besieging the fort of Bassia. In return for which marks of honour, our new cardinal and legate prevailed with the king his master to take part with his holiness against the King of France. Nor was he less zealous in the service of that pontiff during his life, than in honouring and defending his memory after his death. There are extant in Rymer's *Fœdera*, &c. two letters, one from Cardinal Bambridge, during his residence at Rome, to King Henry VIII. concerning the pope's bull giving him the title of Most Christian King; and another from the Cardinal de Sinigallia to the king, acquainting his highness that he had delivered that instrument to Cardinal Bambridge. This prelate died at Rome, the 14th of July, 1514, being poisoned by one of his domestics, in revenge for some blows he had given him.

BAMPTON, a large town in Oxfordshire, with a small market on Monday. It is seated near the Thames, twelve miles W. of Oxford, and seventy W. by N. of London.—Long. 1. 25. W. Lat. 51. 46. N.

BANCROFT (Richard), archbishop of Canterbury, in the reign of King James I. was son of John Bancroft, gentleman, and Mary, daughter of Mr. John Curwyn, brother of Dr. Hugh Curwyn, archbishop of Dublin; and was born at Farnworth in Lancashire, in September 1544. After being severely trained up in grammatical learning, he was entered a student of Christ College, in Cambridge, where, in 1566-7, he took the degree of bachelor of arts; and from thence he removed to Jesus College, where, in 1570, he commenced master of arts. Soon after, he was made chaplain to Dr. Cox, bishop of Ely, who, in 1575, gave him the rectory of Teverham in Cambridgeshire. The year following, he was licensed one of the university preachers; and in 1580 was admitted bachelor of divinity. September the 14th, 1584, he was instituted to the rectory of St. Andrew, Holborn, at the presentation of the executors of Henry earl of Southampton. In 1585 he commenced doctor in divinity; and the same year was made treasurer of St. Paul's cathedral, in London. The year following he became rector of Cotingham in Northamptonshire, at the presentation of Sir Christopher Hatton, lord chancellor, whole chaplain he then was. February the 25th, 1589, he was made a prebendary of St. Paul's; in 1592, advanced to the same dignity in the collegiate church of Westminster; and, in 1594, promoted to a stall in the cathedral of Canterbury. Not long before, he had distinguished his zeal for the church of England by a learned and significant sermon, preached against the puritans at St. Paul's Cross. In 1597, Dr. Bancroft, being then chaplain to the archbishop of Canterbury, Whitgift, was advanced to the see of London, in the room of Dr. Richard Fletcher, and consecrated at Lambeth the 8th of May.—From this time he had, in effect, the archiepiscopal power; for the archbishop, being declined in years, and unfit for business, committed the sole management of ecclesiastical affairs to Bishop Bancroft. Soon after his being made bishop he expended 1000 marks in the repair of his house in London.

In the year 1600, he, with others, was sent by Queen Elizabeth to Embden, to put an end to a difference between the English and Danes: but the embassy had no effect. This prelate interposed in the disputes between the secular priests and the Jesuits, and furnished some of the former with materials to write against their adversaries. In the beginning of King James's reign, Bishop Bancroft was present at the conference held at Hampton-court, between the bishops and the presbyterian ministers. The same year, 1603, he was appointed one of the commissioners for regulating the affairs of the church, and for perusing and suppressing books, printed in England, or brought into the realm without public authority. A convocation being summoned to meet March 20, 1603-4, and Archbishop Whitgift dying in the mean time, Bishop Bancroft was, by the king's writ, appointed president of that assembly. October 19th, 1601, he was nominated to succeed the archbishop in that high dignity, to which he was elected by the dean and chapter, November 17, and confirmed in Lambeth chapel, December 10. September 5, 1605, he was sworn one of his majesty's most honourable privy-council. This year, in Michaelmas term, Archbishop Bancroft exhibited certain articles, to the lords of the council, against the judges. In 1608 he was declared chancellor of the university of Oxford, in the room of the Earl of Dorset, deceased. In 1610 this archbishop offered to the parliament a project for the better providing a maintenance for the clergy, but without success. One of our historians pretends, that Archbishop Bancroft set on foot the building a college near Chelsea, for the reception of students, who should answer all popish and other controversial writings against the church of England. This prelate died November 2, 1610, of the stone, in his palace of Lambeth.

BANCROFT (John), bishop of Oxford, in the reign of King Charles I. and nephew of the preceding Dr. Richard Bancroft, archbishop of Canterbury, was born at Astell, or Eftwell, a small village, between Whitney and Burford, in Oxfordshire, and admitted a student of Christ-church, in Oxford, in 1592, being then about eighteen years of age. Having taken the degrees in arts, and entered into holy orders, he became a preacher for some years in and near Oxford. In 1609, being newly admitted to proceed in divinity, he was, through the interest and endeavours of his uncle, elected head of the University College, in which station he continued above twenty years; during which time he was at great pains and expence in recovering and settling the ancient lands belonging to that foundation. In 1632 he was advanced to the see of Oxford, upon the translation of Dr. Corbet to that of Norwich, and consecrated about the 6th of June. This prelate died in 1640, and was buried at Cuddesden in Oxfordshire, the 12th of February.

BANGALORE, a strong fortress of Myfore, in the peninsula of Hindoostan. It is a place of great political importance, being, from its situation, the bulwark of the Myfore country, toward Arcot. It was taken by the English in 1791; but restored by the treaty of peace in 1792. It is seventy-four miles from Seringapatam, the capital of Myfore. Long. 77. 37. E. Lat. 13. 0. N.

BANGIUS (Thomas), a Danish divine, and an elegant Latin writer on the origin of languages, and a variety of other subjects. He died in 1661.

BANJAR, a river in the island of Borneo, in the Indian Ocean, in the mouth of which is a town where the English East-India Company have a factory.

BANIER (Anthony), licentiate in laws, member of the Academy of Inscriptions and Belles-lettres, and ecclesiastical affairs of the diocese of Clermont in Auvergne; died in November 1741, aged 69. He is principally celebrated for his transla-

tion of the *Metamorphoses* of Ovid, with historical remarks and explanations; which was published in 1732, at Amsterdam, in folio, finely ornamented with copper-plates, by Picart; and reprinted at Paris, 1738, in two vols. 4to.: and for his *Mythology*, or fables of the ancients explained by history; a work full of the most important information, which was translated into English, and printed at London in 1741, in 4 vols. 8vo.

BANISTER (John), a physician and surgeon in the reign of Queen Elizabeth, was educated at Oxford, where, says Anthony Wood, he studied logicals for a time; but afterwards applied himself solely to physic and surgery. In 1573 he took the degree of bachelor of physic; and, obtaining a licence from the university to practise, settled at Nottingham, where he lived many years in great repute. When or where he died, is not known. There was a long poetical memorial of him in the church of St. Olave, Silver-street, London, which is preserved by Stow. He was author of, 1. *A needful, new, and necessary Treatise of Chirurgery, briefly comprehending the general and particular Curation of Ulcers*. Lond. 1575, 8vo. 2. *Certain Experiments*, of his own invention. 3. *The History of Man, sucked from the Sappe of the most approved Anatomists*, &c. in nine books. Lond. 1578, thin fol. 4. *Compendious Chirurgery, gathered and translated especially out of Wecker, &c.* Lond. 1585, 12mo. 5. *Antidotary chyrurgical, containing variety of all Sorts of Medicines, &c.* Lond. 1589, 8vo. His works were collected and published in 1633, 4to.

BANSTEAD, a village of Surrey, noted for an abundance of walnut-trees; but more for its neighbouring downs, one of the most delightful spots in England, on account of its fine carpet ground, covered with short herbage, perfumed with thyme and juniper, which make the mutton of this spot very sweet, though small. It has several fens around it, and a prospect of several counties, including Windsor, Hampton-court, and London. These downs form a tract of thirty miles, extending, under different denominations, from Croydon to Farham. On that part of them near Banstead is a noted four-miles course. Banstead is thirteen miles S.S.W. of London.

BAPAUME, a town of France, in the department of the Straits of Calais, and late province of Artois, twelve miles S.E. of Arras. Long. 2. 35. E. Lat. 50. 8. N.

BARBARIUM (anc. geog.), a promontory of Lusitania, to the south of the mouth of the Tagus; now called *Cabo de Espichel*. W. long. 6. N. lat. 37.

BARBARUS (Francis), a noble Venetian, was a man of great fame in the 15th century, not only for learning, but likewise for a skillful address in the management of public affairs. He is author of a book *De Re Uxoribus*, and some *Specches*.

BARBARUS (Hermolaus), grandson of the preceding, one of the most learned men in the 15th century. The public employments he was entrusted with early, did not prevent him from cultivating polite learning with great application. As he was very skilful in the Greek, he undertook the most difficult translations, and began with a famous paraphrase upon Aristotle. He then attempted Dioctories, whose text he corrected, gave a translation of him, and added a commentary. But of all his works, there is none which has gained him so much reputation as that which he made upon Pliny; he corrected in him above 5000 passages, and occasionally restored 300 in Pomponius Mela. Pope Innocent VIII. to whom he was ambassador, conferred the patriarchate of Aquileia upon him. He was so imprudent as to accept of it without waiting for the consent of his superiors: though he could not be ignorant that the republic of Venice had

made laws to forbid all the ministers they sent to the court of Rome to accept any benefice. His superiors were inflexible; and not being able to gain any thing upon them, either by his flattery or his father's interest, the father died of grief, and the son soon followed him.

BARBARUS (Daniel), of the same family with the preceding, was patriarch of Aquileia, and famous for his learning. He was ambassador from Venice to England; and was one of the fathers of the council of Trent, where he acted with great zeal for the interest of the pope. He wrote, 1. A commentary upon Vitruvius. 2. *Catena Grecorum Patrum in quinquaginta Psalmos Latine versa*. 3. *La Prattica della Perspectiva*. He died in 1569, at 41 years of age.

BARBESUL (anc. geog.), a town and river of Bætica, and a colony in the resort of the Conventus Gaditanus in Spain; now *Marbella*, in Granada.

BARBEYRAC (John), was born in Bessiers, in Lower Languedoc, in 1674. He was made professor of law and history at Lausanne, in 1710; which he enjoyed for seven years, and during that time was three times rector: in 1717, he was professor of public and private law at Groningen. He translated into French the two celebrated works of Puffendorf, his *Law of Nature and Nations*, and his *Duties of a Man and a Citizen*; to both which he wrote excellent notes, and to the former an introductory preface. He translated also Grotius's treatise *De Jure Belli ac Pacis*, with large and excellent notes; and several of Tillotson's sermons. He wrote a work entitled *Traité de Jen*, two vols. 8vo.

BARBOUR (John), archdeacon of Aberdeen, was esteemed an elegant poet in the reign of David I. He wrote the history of Robert de Bruce, in an heroic poem, which is still extant, and which contains many facts and anecdotes omitted by other historians. The latest edition of this book is that of Glasgow, 8vo. printed in the year 1672. It is entitled, *The Acts and Life of the most victorious conqueror Robert Bruce, King of Scotland*; wherein also are contained the martial Deeds of the valliant Princes Edward Bruce, Sir James Dowglais, Earl Thomas Randal, Walter Steward, and sundry others. In one passage, he calls it a *romance*; but that word was then of good reputation: every body knows that the 'Romaunt of Romaunts' has been innocently applied to true history; as well as the 'Ballad of Ballads' to a sacred song.

BARCINO (anc. geog.), a town of the Terraconensis, in Spain, and capital of the Laetani. Now *Barcelona*. See that article.

BARCLAY (Alexander), a learned monk in the reign of Henry VIII. Where he was born, though of no great importance, was nevertheless a matter of virulent contention among his former biographers. Bale, who was his contemporary, is of opinion he was born in Somersetshire. There is indeed a village of his name, and a numerous family, in that county. Pitts thinks he was born in Devonshire.—Mackenzie is positive he was a Scotchman; but, without proof, unless we admit as such his name, *Alexander*. He was, however, educated in Oriel College, Oxford. After leaving the university, he went abroad, and continued some time in France, Italy, and Germany, where he acquired a competent knowledge of the languages of those countries, as appears from several translations of books, which he afterwards published. On his return to England, he was made chaplain to his patron the bishop of Tyne, who likewise appointed him a priest of St. Mary, at the college of Ottery, in Devonshire, founded by Grandison bishop of Exeter. After the death of his patron, he became a Benedictine monk of Ely. On the dissolution of that monastery, he first obtained the vicarage of St. Matthew, at Wokey in Somersetshire; and, in 1549,

being then doctor of divinity, was presented to the vicarage of Much Badew in Essex. In 1552 he was appointed rector of Allhallows, Lombard-street, which he lived to enjoy but a very short time. He died at Croydon in Surrey, in June 1552. He is generally allowed to have improved the English language, and to have been one of the politest writers of his time. He composed several original works; but was chiefly remarkable for his translations from the Latin, Italian, French, and German languages. His version from Sallust of the war of Jugurtha is accurate, and not without elegance. His lives of several faints, in heroic verse, are still unpublished. His *Stultifera Navis*, or *The Ship of Fools*, is the most singular of his performances. It was printed by Richard Pynson, at London, 1509, in folio; and contains a variety of wooden plates, which are worthy the inspection of the curious.

BARCLAY (William), a learned Civilian, was born in Aberdeenshire, in the year 1541. He spent the early part of his life, and much of his fortune, at the court of Mary queen of Scots, from whose favour he had reason to expect preferment. In 1573 he went over to France, and at Bourges commenced student of civil law under the famous Cujacius. He continued some years in that seminary; where he took a doctor's degree; and was soon after appointed professor of civil law in the university of Pont-à-Mousson, then first founded by the Duke of Lorraine. That prince afterwards made him counsellor of state, and master of requests. Barclay, in the year 1581, married Ann de Mallaville, a French lady, by whom he had a son, who became a celebrated author, and of whom the reader will find an account in the next article. This youth the Jesuits would gladly have received into their society. His father refused his consent, and for that reason these disciples of Jesus soon contrived to ruin him with the duke his patron. Barclay now embarked for Britain, where King James I. offered him considerable preferment, provided he would become a member of the church of England: but, not choosing to comply, he returned to France in 1604; and, soon after his arrival, was appointed professor of civil law in the university of Angers, where he died the year following, and was buried in the Franciscan church. He was esteemed a learned civilian; and wrote elaborately in defence of the divine right of kings, in answer to Buchanan and others. The titles of his works are, 1. *De regno et regali potestate*, &c. 2. *Commentarius in tit. pandectarum de rebus creditis, et de jurejurando*. 3. *De potestate papæ*, &c. 4. *Præmia in vitam Agricole*.

BARCLAY (John), son of the former, was, as we have above mentioned, so great a favourite of the Jesuits, that they used all their efforts to engage him in their society. His father would not consent, and carried his son with him into England, who was already an author, for he had published *A Commentary upon the Theatres of Statius*, and a Latin poem on the coronation of King James, and the first part of *Euphormio*, 1603. He returned to France with his father; and after his father's death went to Paris, and soon after came back to London: he was there in 1606. He published *The History of the Gunpowder Plot*, a pamphlet of six leaves, printed at Amsterdam. He published at London, in 1610, *An Apology for the Euphormio*, and his father's treatise *De potestate papæ*. And at Paris, 1612; he published a book entitled *Pielas*, in answer to Cardinal Bellarmine, who had written against William Barclay's book concerning the power of the pope. Two years after, he published *Icon Animorum*. He was invited to Rome by Pope Paul-V. and received a great deal of civility from Cardinal Bellarmine, though he had written against him. He died at Rome in 1621, while his *Argenis* was printing at Paris. This celebrated work has since gone through a great number of editions, and has

VOL. X.

been translated into most languages. M. de Peirese, who had the care of the first edition, caused the effigies of the author to be placed before the book; and the following distich, written by Grotius, was put under it:

*Gente Caledonia, Galles rotundus, hic est,
Romæ Romanus qui doctus ore loquitur.*

BARDON HILLS, in Leicestershire: these hills, which are to the N.W. part of the county, rise to a considerable height.

BAREGES, a village of France, in the department of the Upper Pyrenæes and late province of Bigorre. It is much frequented on account of its mineral baths. It is seated in a valley of the same name (which contains the little town of Luz and 17 villages), twelve miles S. of Bagneres.

BARUM (anc. geog.), a town of Apulia on the Adriatic; so called from the founders, who being expelled from the island Bora, built this town. It is now called Bari; see that article.

BARK (*Encycl.*). The bark of the oak has been long used in tanning leather, and even thought essential to that operation (see TANNING); but a different substance has been discovered, which answers the purpose full as well, and may be procured at a much cheaper rate; we mean oak saw-dust, or the chips of oak reduced to powder. This valuable secret was purchased by the Society for the Encouragement of Arts, &c. Much facility in the preparation of bark for the purposes of tanning has lately been occasioned by different patent inventions, of which we shall here give an account, in the words of the several specifications.

Mr. Weldon, of Lichfield, states his improvements on a machine or mill for grinding bark, and various other articles, for which he obtained a former patent, in the following way: "My former method of constructing mills for grinding bark (says he), is chiefly of cast-iron, the teeth or cutters thereof cast with them; and the method of keeping them sharp, or renewing their teeth, is to chip or cut them with a hammer and chisel; and the method of making and constructing what are commonly called steel-mills, for the purpose of grinding malt, &c. are chiefly made of malleable iron case-hardened, the teeth of which are cut or raised out of the solid by means of chisels and files, and are kept sharp by the same method. But in order to avoid these difficulties, and make them (the teeth) more durable and lasting, and that the user of such mills or machines may be able to sharpen his own mill or machine, and keep the same in repair without sending them to the maker, I have constructed them with loose or moveable teeth, which may be taken out at any time, and by grinding them on a common grinding-stone, may be sharpened and kept in order, or by replacing the teeth should they wear out, the machine will then be as good as new; and to shew the nature of my invention, I have added drawings on the opposite side thereof; but as the principle of the machine or mill for grinding bark is the same as that of my former patent, it is not necessary to describe any more of it than the manner in which the loose teeth are to be fixed, which may be the same as that described in the drawing for a corn mill, or by any other method I may think most proper. Fig. 1. (Plate 15) represents the different parts of a mill for grinding bark, corn, &c. and the manner in which it is constructed. A, is a hopper made of wood, tin, or sheet-iron, which receives the corn or any thing that is to be ground. B, is the axis of the ball or inner part of the mill, which may be made of wrought or cast iron. C, is a conical covering, which prevents the materials, to be ground, from lodging on the cap, which may be made of wood, tin, or sheet-iron. D, D, is a loose cap, which fastens and secures the loose teeth of the ball or inner part of the mill, by means of four screws represented by E.

E, represents one side of the ball or inner part of the mill filled with teeth. **G**, shows one half of the inner part of the mill without teeth, wherein may be seen the manner in which the teeth are kept in their places. **d d**, shews the substance of the metal, which is of cast-iron. **HH**, shews the bottom flanch that holds the teeth, and is cast with the body part of the cone. **a a a**, shews the outer cylinder, which is cast altogether, and shews in what manner the loose teeth **F, F**, are fixed in it. **I I**, is a flanch which fastens or holds the loose teeth of the outer part of the mill by means of fix screws, as shewn by fig. 3. **KK**, is the bridge which carries the inner part of the mill, and is fastened to the outer cylinder by means of two screws, **c, c**. **L**, is the lower part of an axis. **M**, the brads step on which the axis works. **N**, is a plate in which the regulating screw works, and is made of wrought iron. **O**, the regulating screw. Fig. 2. represents the under side of the outer cylinder, with the bridge **K**, and the box which contains the brads step **M**. Fig. 4. represents one of the loose teeth on the outer part of the mill. Fig. 5. represents one of the teeth on the inner part of the mill: these teeth may be made of cast-iron, wrought-iron, or steel, or any metal or materials that may be thought most proper. These mills or machines are not confined to any precise form or shape, and may be made of any metal or materials I may think most suitable. They may be worked either as hand-mills or horse-mills, or by any other power that can be applied to them."

Mr. Bagnall, of Wordley in Lancashire, has invented a mill or machine to chop bark, and grind, and riddle, and pound it; to beam or work green hides and skins out of the mauling or drench, and make them ready and fitting for the oufe or bark liquor; to beam sheep skins, and other skins, for the skinner's use; and for scouring and taking the bloom off or from tanned leather when in the currying state. See Plate 15.

Fig. 1. is a horizontal plan of the mill. Fig. 2. longitudinal section of it. Fig. 3. transverse section of it.

A, The water-wheel, by which the whole machinery is worked.

B, The shafts.

C, The pit-wheel, which is fixed on the water-wheel shaft **B**, and turns the upright shaft **E**, by the wheel **F**, and works the cutters and hammer by tapets.

D, The spur and bevil-wheel at the top of upright shafts.

E, The upright shaft.

F, The crown-wheel, which works in the pit-wheel **C**.

G, The spur-nut to turn the stones **I**.

P, The beam, with knives or cutters fixed at the end to chop or cut the bark, which said bark is to be put upon the cutters or grating **i**, on which said beam is to fall.

Q, The tryal that receives the bark from the cutters **i**, and conveys it into the hopper **H**, by which it descends through the shoe **J** to the stones **I**, where it is ground.

K, The spout, which receives the bark from the stones, and conveys it into the tryal **L**, which tryal is wired to sift or dress the bark, as it descends from the stones **I**.

M, The trough to receive the bark that passes through the tryal **L**.

R, The hammer, to crush or bruise the bark that falls into the dish **S**, which said dish is on the incline, so that the hammer keeps forcing it out of the lower side of the said dish, when bruised.

i, A trough to receive the dust and mofs that passes through the tryal **Q**.

T, The bevil-wheel, that works in the wheel **D**, which works the beam-knife by a crank **V** at the end of the shaft **n**.

W, The penetrating rod, which leads from the crank **V** to the start **x**.

x, The start, which has several holes in it to lengthen or shorten the stroke of the beam-knife.

y, The shaft, to which the slide rods **b, b**, are fixed by the starts **n, n**.

b, The slide rod, on which the knife **f** is fixed; which said knife is to work the hides, &c. On the knife are two springs **a, a**, to let it have a little play as it makes its stroke backwards and forwards, so that it may not scratch or damage the hides, &c.

z, Is a catch in slide-rod **b**, which catches on the arch-head **c**; and the said arch-head conveys the knife back without touching the hide, and then falls back to receive the catch again.

l, The roller to take up the slide-rod **b**, while the hides are shifting on the beam **b** by pulling at the handle **m**.

b, The beam to work the hides, &c. on. Each beam has four wheels **p, p**, working in a trough road **g, g**, and removed by the levers **c, c**. When the knife has worked the hide, &c. sufficiently in one part, the beam is then shifted by the lever **c** as far as is wanted.

d, A press, at the upper end of the beam, to hold the hide fast on the beam while working.

e, An arch-head, on which the slide-rod **b** catches.

f, The knife fixed on the slide-rod **b**, to work the hides, &c.

i, Cutters or grating to receive the bark for chopping.

The beam **P**, with knives or cutters, may either be worked by tapets, as described, or by the bevil-wheel **T**, with a crank, as **V**, to cut the same as shears.

The knife **f** is fixed at the bottom of the start, which is fixed on the slide rod **b**; the bottom of the start is split open to admit the knife, the width of one foot; the knife should have a gudgeon at each end, to fix in the open part of the start; and the two springs **a, a**, prevent the knife from giving too much way when working; the knife should be one foot long and four or five inches broad.

The arch-head **c** will shift nearer to, or farther from, the beam **b**, and will be fixed so as to carry the knife back as far as is wanted, or it may be taken away till wanted.

The roller **l** is taken up by pulling at the handle **m**, which takes up the slide-rod so high as to give head-room under the beam-knife. The handle may be hung upon a hook for that purpose. The slide-rod will keep running upon the roller all the time the hide is shifting; and when the hide is fixed the knife is put on the beam again by letting it down by the handle **m**. There may be two or more knives at work on one beam at the same time, by having different slide-rods. There should be two beams, so that the workman could be shifting one hide, &c. while the other was working. The beam must be flat, and a little on the incline. As to the breadth it does not matter, the broader it is the less shifting of the hides will be wanted, as the lever **c** will shift them as far as the width of the hide, if required. Mr. Bagnall has formed a kind of press **d**, to let down, by a lever, to hold the hide fast on each side of the knife if required, so that it will suffer the knife to make its back stroke without pulling the hide up as it comes back. The slide-rod may be weighted, to cause the knife to lay stress on the hide, &c. according to the kind and condition of the goods to be worked.

Hides and skins for the skinner's use are worked in the same way as for the tanners.

Scouring of tanned leather for the currier's use will be done on the beam the same as working green hides. It is only taking the knife away, and fixing a stone in the same manner as the knife by the said joint, and to have a brush fixed to go either before or after the stone. The leather will be better secured this way than by hand, and much sooner.

The whole machinery may be worked by water, wind, steam, or any other power. And that part of the machinery

Mr Weldon's improved Bark Mill.

Fig. 2.

which relates to the beaming part of the hides, may be fixed to any horse bark-mill, or may be worked by a horse or other power separately.

The intention of working hides and skins upon the beam is to clean, and get out of them all the lime and dirt that can be got out, which is the principal part of the business for making good leather; the dirt will be got out much better, and the hides be made cleaner, this way than they can by hand, and at much less expence.

BARCKHAM (Dr. John), a learned divine and antiquary, born at Exeter about 1572, bred at Oxford, possessed successively of several preferments, and dying at Bocking in Essex, of which he was rector and dean, 1642. Though not very distinguished, he was yet a very accomplished man; an exact historian, a good herald, a great antiquary, and had an excellent collection of coins and medals, which he gave to Archbishop Laud, and which Laud gave to the university of Oxford. He was concerned in several works, though he never published his name. The historian Speed, at the conclusion of his work, makes his acknowledgments for the assistance he had from Barkham; whom he styles "a gentleman, composed of learning, virtue, and courtesy." The reigns of John and Henry II. are reckoned to be chiefly of his writing. He had also the chief hand in "Guillam's Display of Heraldry," published in 1610, folio.

BARLÆUS (Gasper), professor of philosophy at Amsterdam, and one of the best Latin poets of the 17th century. There was scarce any thing great that happened in the world while he lived, but he made a pompous elegy upon it, when reasons of state were no obstacle to it. He was a great defender of Arminius; and shewed his abilities in history by his relation of what passed in Brazil during the government of Count Maurice of Nassau, published 1647. He died the year after.

BARLOW (William), bishop of Chichester, descended of an ancient family in Wales, was born in the county of Essex. In his youth he favoured the reformation; and travelled to Germany to be instructed by Luther, and other preachers of the new doctrine. How long he continued a Protestant is uncertain: but from his letter to King Henry VIII. quoted below, it appears that he wrote several books against the church of Rome. However, he was a regular canon in the Augustine monastery of St. Osith in the county of Essex, and studied some time at Oxford with the brothers of that order, where he took the degree of doctor in divinity. He was then made prior of the convent of Bisham in Berkshire; and afterwards succeeded to the several priories of Blackmore, Typtree, Lega, Bromhole, and Havertwest. On the dissolution of abbeyes, he resigned not only with a good grace, but persuaded several other abbots to follow his example. King Henry was so pleased with his ready obedience on this occasion, that he sent him, in 1535, on an embassy to Scotland; in the same year, made him bishop of St. Asaph; in two months after, translated him to the see of St. David's, and in 1547 to that of Bath and Wells. During this time, our good bishop, as appears from a letter of his to the king, was, or pretended to be, a staunch Papist: it was written in 1533. However, when Edward VI. came to the crown, he was again a Protestant, and for that reason, on Queen Mary's accession, was deprived of his bishopric, and sent prisoner to the Fleet, where he continued some time. At length he found means to escape, and immediately joined the other English Protestants in Germany. When Queen Elizabeth ascended the throne, our prelate was raised to the see of Chichester, and soon after made first prebendary of the collegiate church of Westminster. He died in 1568, and was buried in the cathedral at Chichester. He had

five daughters, each of whom married a bishop. He wrote, 1. *The Buryal of the Masse*. 2. *The climbing up of Fryers and religious Persons ported with Figures*. 3. *Christian Homilies*. 4. *A book upon Cosmography*. 5. *The godly and pious Institution of a Christian Man, commonly called the Bishop's Book*; and several other works. He is said to be the translator of the apocrypha as far as the book of Wisdom. His letters to M. Parker are in manuscript in Corpus Christi College, Cambridge, Misc. l. 445.

BARLOW (William), a mathematician and divine, the son of the bishop of Chichester, was born in Pembrokeshire whilst his father was bishop of St. David's. In 1560 he was entered commoner of Balliol College in Oxford; and in 1564, took a degree in arts, which having completed by determination, he left the university and went to sea; but in what capacity is uncertain: however, he acquired considerable knowledge in the art of navigation. About the year 1573 he entered into orders; and became prebendary of Winchester and rector of Easton near that city. In 1588 he was made prebendary of Lichfield, which he exchanged for the place of treasurer of that church. Some years after he was made chaplain to Prince Henry, the son of King James I.; and in 1614, archdeacon of Salisbury. He was the first writer on the nature and properties of the magnet. Barlow died in the year 1625, and was buried in the church at Easton. His works are, 1. *The Navigator's Supply, containing many Things of principal Importance belonging to Navigation, and Use of divers Instruments framed chiefly for that Purpose*. 1597, 4to. Dedicated to Robert earl of Essex. 2. *Magnetical Advertisements, or diverse pertinent Observations and approved Experiments concerning the Nature and Properties of the Loadstone*. Lond. 1616, 4to. 3. *A brief Discovery of the idle Animadversions of Mark Ridley, M. D. upon a Treatise entitled Magnetical Advertisements*. 1618, 4to.

BARLOW (Thomas), born in 1607, was appointed fellow of Queen's College in Oxford in 1633; and two years after was chosen reader of metaphysics to the university. He was keeper of the Bodleian library, and in 1657 was chosen provost of Queen's College. After the restoration of King Charles II. he was nominated one of the commissioners for restoring the members unjustly expelled in 1648. He wrote at that time *The Case of Toleration in Matters of Religion*, to Mr. R. Boyle. In 1675, he was made bishop of Lincoln. After the popish plot, he published several tracts against the Roman-catholic religion; in which he shews an uncommon extent of learning, and skill in polemical divinity. Nevertheless, when the Duke of York was proclaimed king, he took all opportunities of expressing his affection toward him; but after the revolution he as readily voted that the king had abdicated his kingdom; and was very vigorous in excluding those of the clergy who refused the oaths from their benefices.

Mr. Granger observes, that "this learned prelate, whose nature designed for a scholar, and who acted in conformity with the bent of nature, was perhaps as great a master of the learned languages, and of the works of the celebrated authors who have written in those languages, as any man of his age. The greatest part of his writings, of which Mr. Wood has given us a catalogue, are against Popery; and his conduct for some time, like that of other Calvinists, appeared to be in direct opposition to the church of Rome. But after James ascended the throne, he seemed to approach much nearer to Popery than he ever did before. He sent the king an address of thanks for his declaration for liberty of conscience, and is said to have written reasons for reading that declaration. His compliances were much the same after the revolution. His moderation, to call it by the softest name, was very great;

indeed to great, as to bring the firmness of his character in question. But casuistry, which was his most distinguished talent, not only reconciles seeming contradictions, but has also been known to admit contradictions themselves. He was, abstracted from this laxity of principles, a very great and worthy man." He died at Buckden in Huntingdonshire, in the 85th year of his age.

BARLOW (Francis), an eminent English painter, was born in Lincolnshire. On his coming to London he was placed with one Shepherd, a limner; but his genius led him chiefly to drawing of birds, fish, and other animals. There are six books of animals from his drawings, and he painted some ceilings with birds for noblemen and gentlemen in the country. His etchings are numerous; his illustration of *Elop* is his greatest work. He died in 1702.—There is something pleasing in the composition and manner of this master, though neither is excellent. His drawing too is very indifferent; nor does he characterise any animal justly. His birds in general are better than his beasts.

BARNARD (Sir John). His first appearance on the public stage, on which he afterwards made such a distinguished figure, was in the year 1722, when he was chosen one of the representatives in parliament for the city of London; a trust which he continued to enjoy during six succeeding parliaments, and which he always discharged with equal integrity and ability. In 1725 he received the thanks of the common-council, for opposing a bill introducing a change in the method of conducting elections in the city of London. In 1727 he was chosen alderman of Dewgate-ward; and the next year prepared and presented to the Commons a bill for the better regulation and government of seamen in the merchant service.

In 1730 the court of Vienna having begun a negotiation in England for a loan of 400,000 pounds, a bill was proposed and enacted, prohibiting all his majesty's subjects from lending any sum of money to any foreign prince whatever, without licence obtained from his majesty, under his privy seal, or some greater authority. Violent opposition was made to this bill by a great number of members; among whom Mr. John Barnard (for the dignity of knighthood he obtained afterwards by his own merit) made no inconsiderable figure. He observed, that if the bill should pass in its present form, it would, in his opinion, open a channel for the Dutch to carry on a very lucrative branch of business to the prejudice of England: that the bill ought absolutely to name the emperor as the power prohibited to borrow; for that otherwise, all the other states of Europe would think themselves equally affected by this act, which would give it the air as if England was at war with all the world: that he was by no means for making the Exchequer a court of inquisition: he conceived it to be equally odious and unconstitutional, that subjects should be obliged to accuse themselves, and thereby incur the most severe penalties.

In the debate upon the famous excise scheme, projected by Sir Robert Walpole in 1733, Sir John shewed himself not more zealous for the trade of his country, than for the honour of those by whom it was principally conducted. While this affair was depending in parliament, the merchants of London, having been convened by circular letters, repaired to the lobby of the House of Commons, in order to solicit their friends to vote against the bill. Sir Robert Walpole, piqued at the impertinence of these gentlemen, threw out some reflections against the conduct of those whom he supposed to have been the means of bringing them thither; and at the same time insinuated, that the merchants themselves could be considered in no other light than that of *STURDY BEGGARS*. This expression was highly resented by all those in the opposition, and particularly by Sir John Barnard. In a word, he made so strenuous an op-

position to this unpopular and unconstitutional scheme, that, in conjunction with other members, he obliged the ministry entirely to lay it aside.

In 1735 he moved for leave to bring in a bill to limit the number of play-houses, and restrain the licentiousness of players, which was now increased to an amazing degree; and though the bill miscarried at that time, it was yet, about two years after, enacted into a law, which still continues in force. In 1736 he served with his brother-in-law, Sir Robert Goddichall, knight, alderman of Bishopsgate-ward, the office of sheriff of the city of London and county of Middlesex. In 1737 he formed a scheme for reducing the interest on the national debt; a project which, though it did not at that time succeed, was nevertheless afterwards carried into execution, to the great emolument of the trading part of the nation. In 1738 he served the high office of lord-mayor of London; and during his mayoralty had the misfortune to lose his lady, who was buried in a very grand manner at Clapham church. Upon the death of Sir John Thompson, knt, in 1749, he removed pursuant to an act of common-council, and took upon him the office of alderman of Bridgewater-without, and then became in name, as he might already be considered in reality, the father of the city; and in July 1758, to the inexpressible regret of his brother aldermen, and of all his fellow-citizens, he resigned his gown.

The same year, upon the motion of Sir Robert Ladbroke, then father of the city, the thanks of the court of aldermen were given to Sir John Barnard.

Upon his resigning the office of alderman, he retired in a great measure from public business, and having again received the thanks of the court of aldermen, continued to live chiefly in a private manner at Clapham; where, after having attained near the age of eighty, he died the 29th of August, 1766.

BARNAVELDT, an island of America, to the S. of *Tierra del Fuego*. Long 66, 58; W. Lat. 55, 49. S.

BARNES (Joshua), professor of the Greek language at Cambridge in the beginning of the 18th century. He was chosen queen's professor of Greek in 1695, a language he wrote and spoke with the utmost facility. His first publication was a whimsical tract, entitled *Cerania, or a new Discovery of the little Sort of People called Pygmies*. After that appeared his *Life of Edward III.* in which he introduces his hero making long and elaborate speeches.—In the year 1700, when he published many of his works, Mrs. Mason, of Hemmingford in Huntingdonshire, a widow lady of between 40 and 50, with a jointure of 200l. *per annum*, who had been for some time a great admirer of him, came to Cambridge, and desired leave to settle 100l. a-year upon him after her death; which he politely refused, unless she would likewise condescend to make him happy with her person, which was not very engaging. The lady was too obliging to refuse any thing to Joshua, for whom, she said, "the sun stood still," and they were accordingly married. Mr. Barnes wrote several other books besides those above mentioned, particularly, *Sacred Poems; The Life of Oliver Cromwell, the Tyrant; several dramatic pieces; A poetical Paraphrase on the History of Esther, in Greek Verse*, with a Latin translation, &c. &c. and he published editions of *Enripides, Anacreon, and Homer's Iliad and Odyssey*, with notes, and a Latin translation. He wrote with greater ease in Greek than even in English, and yet is generally allowed not to have understood the delicacies of that language. He was of such a humane disposition, and so unacquainted with the world, that he gave his only coat to a vagrant begging at his door. This excellent man died on the 3d of August, 1712, in the 58th year of his age.

BARNEVELDT (John d' Olden), the celebrated Dutch statesman, and one of the founders of the civil liberty of Holland. His patriotic zeal induced him to limit the autho-

nity of Maurice prince of Orange the second stadtholder of Holland, the partisans of that prince falsely accused him of a design to deliver his country into the hands of the Spanish monarch. On this absurd charge he was tried by 26 commissaries deputed from the seven provinces, condemned, and beheaded in 1619. His sons William and René, with a view of revenging their father's death, formed a conspiracy against the stadtholder, which was discovered. William fled: but René was taken and condemned to die; which fatal circumstance has immortalized the memory of his mother, of whom the following anecdote is recorded. She solicited a pardon for René; upon which Maurice expressed his surprise that she should do that for her son, which he had refused for her husband. To this remark, she replied with indignation, "I would not ask a pardon for my husband, because he was innocent. I solicit it for my son, because he is guilty."

BARNSELEY, a village of Gloucestershire, noted for large quarries of excellent free stone. It is four miles from Cirencester.

BARO, or BARON (Peter), professor of divinity in the university of Cambridge, in the 16th century, was born at Etampes in France, and educated in the university of Bourges, where he was admitted a licentiate in the law: but being of the Protestant religion, he was obliged to leave his native country to avoid persecution; and, withdrawing into England, was kindly entertained by Lord Burleigh. He afterwards settled at Cambridge; and, by the recommendation of his noble patron, was, in 1574, chosen Lady Margaret's professor there. For some years he quietly enjoyed his professorship: but there was at last raised a restless faction against him, by his opposing the doctrine of absolute predestination; which rendered his place so uneasy to him, that he chose to leave the university and to settle in London. He wrote, 1. *In Jonam Prophetam Prælectiones* xxxix. 2. *De Præstantia & Dignitate Divina Legis*; and other pieces. He died in London, about the year 1600.

BAROACH, a town in Hindoostan, in the N. W. of the Deccan, and on the S. bank of the river Nerbudda, 40 miles N. of Surat. Long. 72. 55. E. Lat. 21. 25. N.

BARON (Robert), a dramatic author, who lived during the reign of Charles I. and the protectorship of Oliver Cromwell. He received the earlier parts of his education at Cambridge, after which he became a member of the honourable society of Gray's-Inn. During his residence at the university, he wrote a novel called the *Cyprian Academy*, in which he introduced the two first of the dramatic pieces mentioned below. The third of them is a much more regular and perfect play, and was probably written when the author had attained a ripper age. The names of them are, 1. *Deorum Dona*, a masque. 2. *Gripius et Hegio*, a pastoral. 3. *Mirza*, a tragedy. Mr. Baron had a great intimacy with the celebrated Mr. James Howell, the great traveller, in whose collections of letters there is one to this gentleman, who was at that time at Paris. To Mr. Howell, in particular, and to all the ladies and gentlewomen in England in general, he has dedicated his romance.

BARON (Michael), an excellent comedian of Paris, was the son of Michael Baron, another comedian, who was a native of Ibbudun. He wrote some poems, and several theatrical pieces, which are printed together in two vols. 12mo. He died at Paris in 1729, aged 77.

BARON (Bonaventure) whose true name was Fitz-Gerald, was descended from a branch of the Fitz-Geralds, of Burnchurch, in the county of Kilkenny. He has been more remarkable in the learned world for his maternal genealogy, being the son of a sister of Luke Wadding, that eminent Franciscan friar, who, in the last century, demonstrated his

great abilities and industry, by many voluminous treatises of genius and labour. His uncle Wadding took great care of his education in his youth, which he saw rewarded by an uncommon diligence; and when he was of a proper age procured his admission into the Franciscan order, and sent for him to Rome; where he lived under his own eye, in the college of St. Isidore, a society of that order founded by himself in 1625, for the education of Irish students in the study of the liberal arts, divinity, and controversy, to serve as a seminary, out of which the mission into England, Scotland, and Ireland, might be supplied. Baron, after some time, grew into high reputation, and became especially remarkable for the purity of his Latin style, which first fell under the notice of the public, by means of the ignorance of a Roman cardinal; from which time his fame increased, and he became the author of many books both in prose and verse. He was for a considerable time prelector of divinity in the college aforesaid, and in all resided at Rome about sixty years, where he died on the 18th of March, 1696.

BARONI (Leonora), a celebrated singer and composer, was born at Naples, but spent the greatest part of her life at Rome. She was daughter of Adriana Baroni, of Mantua, baroness of Pian-carella; a lady also distinguished for her musical talents, and for her beauty furnished the fair.—Leonora had less beauty than her mother; but excelled her in her profound skill in music, the fineness of her voice, and the charmingness of her manner. She is said by Mr. Bayle to have been one of the finest singers in the world. She was, as well as her mother, celebrated by the wits, who strove to excel each other in recording her praises; and in 1639, there was published, at Bracciano, a collection of Latin, Greek, Italian, Spanish, and French poems, made up on her, under this title, *Applausi Poetici alle Glorie della Signora Leonora Baroni*. Among the Latin poems of Milton are no fewer than three entitled "Ad Leonoram Romæ canentum," wherein this lady is celebrated for her singing, with an allusion to her mother's exquisite performance on the lute. A fine eulogium on this accomplished woman is contained in a discourse on the Music of the Italians, printed with the life of Malherbe, and some other treatises, at Paris, 1672, in 12mo. This discourse was composed by Mr. Maugars, prior of St. Peter de Mac, the king's interpreter of the English language, and besides so famous a performer on the viol, that the king of Spain and several other sovereign princes of Europe desired to hear him. The character given by this person of Leonora Baroni is as follows: "She is endowed with fine parts; she has a very good judgment to distinguish good from bad music; she understands it perfectly well; and even composes, which makes her absolute mistress of what she sings, and gives her the most exact pronunciation and expression of the sense of her words. She does not pretend to beauty, neither is she disagreeable, or a coquet. She sings with a bold and generous modesty, and an agreeable gravity; her voice reaches a large compass of notes, and is exact, loud, and harmonious; she softens and raises it without straining or making grimaces. Her raptures and sighs are not lascivious; her looks have nothing impudent, nor does she transgress a virgin modesty in her gestures. In passing from one key to another, she shews sometimes the divisions of the enharmonic and chromatic kind with so much art and sweetness, that every body is ravished with that fine and difficult method of singing. She has no need of any person to assist her with a theorbo or viol, one of which is necessary to make her singing complete; for she plays perfectly well herself on both these instruments. In short, I have had the good fortune to hear her sing several times above thirty different airs, with second and third stanzas composed by

herself. I must not forget to tell you, that one day she did me the particular favour to sing with her mother and her sister. Her mother played upon the lute, her sister upon the harp, and herself upon the theorbo. This concert, composed of three fine voices, and of three different instruments, so powerfully transported my senses, and threw me into such raptures, that I forgot my mortality, and thought myself already among the angels enjoying the felicity of the blessed."

BARONIUS (Cæsar), a pious and learned cardinal, was born at Sore in 1538. He studied at Rome, and put himself under the discipline of St. Philip de Neri. In 1593 he was made general of the congregation of the Oratory by the resignation of the founder Philip de Neri. Pope Clement VIII. made him his confessor, and created him a cardinal in 1596. He was afterwards made librarian to the Vatican; and died in 1605, at 68 years of age. He wrote several works, the principal of which is his *Annales Ecclesiastici*, from A.D. 1 to 1198, in twelve vols. folio; which has been abridged by several persons, particularly by Henry Spondæus, Bezovius, and Ludovico Aurelio.

BARRATIERE (Philip), a most extraordinary instance of the early and rapid exertion of mental faculties. This surprising genius was the son of Francis Barratiere, minister of the French church at Schwobach, near Nuremberg, where he was born January 10, 1721. The French was his mother tongue, together with some words of High Dutch; but by means of his father insensibly talking Latin to him, it became as familiar to him as the rest; so that, without knowing the rules of grammar, he, at four years of age, talked French to his mother, Latin to his father, High Dutch to the maid or neighbouring children; and all this without mixing or confounding the respective languages. About the middle of his fifth year he acquired Greek in like manner; so that in fifteen months he perfectly understood all the Greek books in the Old and New Testament, which he readily translated into Latin. When he was five years and eight months old, he entered upon Hebrew; and in three years' time was so expert in the Hebrew text, that from a Bible without points, he could give the sense of the original in Latin or French; or translate extempore the Latin or French versions into Hebrew, almost word for word; and had all the Hebrew psalms by heart. He composed at this time a dictionary of rare and difficult Hebrew words, with critical remarks and philological observations, in about 400 pages, in 4to; and, about his tenth year, amused himself for twelve months with the rabbinical writers. With these he intermixed a knowledge of the Chaldaic, Syriac, and Arabic; and acquired a taste for divinity and ecclesiastical antiquity, by studying the Greek fathers, and councils of the first four ages of the church. In the midst of these occupations, a pair of globes coming into his possession, he could in eight or ten days' time resolve all the problems on them; and in about three months, in Jan. 1735, devised his project for the discovery of the longitude, which he communicated to the Royal Society at London and the Royal Academy of Sciences at Berlin. In June 1737 he was matriculated in the university of Altorf; and at the close of the year 1732 he was presented by his father at the meeting of the reformed churches of the circle of Franconia; who, astonished at his wonderful talents, admitted him to assist in the deliberations of the synod; and to preserve the memory of so singular an event, it was ordered to be registered in their acts. In 1734 the Margrave of Brandenburg Anspach granted this young scholar the use of whatever books he wanted from the Anspach library, together with a pension of fifty florins, which he enjoyed three years; and his father receiving a call to the French church at Stetin in Pomerania, young Barratiere was, on the journey, admitted master of

arts, with universal applause, at the university of Hall: at Berlin, he was honoured with several conversations with the King of Prussia, and was received into the royal academy. Towards the close of his life he acquired a taste for medals, inscriptions, and antiquities; metaphysical enquiries, and experimental philosophy, intervening occasionally between these studies. He wrote several essays and dissertations; made astronomical remarks, and laborious calculations; took great pains toward a history of the heresies of the anti-trinitarians, and of the thirty-years' war in Germany: his last publication, which appeared in 1740, was on the succession of the bishops of Rome. The final work he engaged in, for which he had gathered large materials, was *Enquiries concerning the Egyptian Antiquities*. But the subsistence of this blazing meteor was now almost exhausted: he was always weak and sickly; and died October 5, 1740, aged nineteen years eight months and sixteen days. He published eleven different pieces, and left twenty-six MSS. on various subjects, the contents of which may be seen in his life written by M. Forney, professor of philosophy at Berlin.

BARRE (Louis François Joseph de la), of Tournay, author of several works printed at Paris. Amongst others, *Imper. Orientale, Recueil des Médailles des Empereurs, Mémoires* for the history of France, &c. He died in 1738.

BARRINGTON (John Shute), lord viscount, a nobleman of considerable learning, and author of several books, was the youngest son of Benjamin Shute, merchant, youngest son of Francis Shute, of Upton, in the county of Leicester, esq. He was born at Theobalds in Hertfordshire, in 1678, and received part of his education at Utrecht, as appears from a Latin oration which he delivered at that university, and published there in 1698, in 4to. After his return to England, he applied himself to the study of the law in the Inner Temple. In 1701 he published, but without his name, *An Essay upon the Interest of England, in Respect to Protestants dissenting from the established Church*, 4to. This was reprinted two years after, with considerable alterations and enlargements. Some time after this he published another piece, in 4to. entitled *The Rights of Protestant Dissenters*, in two parts. During the prosecution of his studies in the law, he was applied to by Queen Anne's whig ministry, at the instigation of Lord Somers, to engage the Presbyterians in Scotland to favour the important measure, then in agitation, of an union of the two kingdoms. Flattered, at the age of twenty four, by an application which shewed the opinion entertained of his abilities and influence by the greatest lawyer and statesman of the age, he readily sacrificed the opening prospects of his profession, and undertook the arduous employment. The happy execution of it was rewarded, in 1708, by the place of commissioner of the customs; from which he was removed by the Tory administration, in 1711, for his avowed opposition to their principles and conduct. How high Mr. Shute's character stood in the estimation even of those who differed most widely from him in religious and political sentiments, appears from the testimony borne to it by Dr. Swift. In the reign of Queen Anne, John Wildman, of Becket, in the county of Berks, esq. adopted him for his son, after the Roman custom, and settled his large estate upon him, though he was no relation, and is said to have been but slightly acquainted with him. Some years after he had another considerable estate left him by Francis Barrington, of Tofts, esq. who had married his first cousin, and died without issue. This occasioned him to procure an act of parliament, pursuant to the deed of settlement, to assume the name and bear the arms of Barrington. On the accession of King George, he was chosen member of

parliament for the town of Berwick-upon-Tweed, July 5, 1717, he had a reversionary grant of the office of master of the rolls, in Ireland, which he surrendered December 10, 1731. King George was also pleased, by privy seal, dated at St. James's, June 10, and by patent at Dublin, July 1, 1720, to create him Baron Barrington, of Newcastle, and Viscount Barrington, of Ardglass. In 1722 he was again returned to parliament as member for the town of Berwick; but in 1723, the House of Commons taking into consideration the affair of the Harburgh lottery, a very severe and unmerited censure of expulsion was passed upon his lordship, as sub-governor of the Harburgh company, under the Prince of Wales. In 1725 he published, in two volumes 8vo, his *Miscellanea Sacra*; or a new method of considering so much of the history of the Apostles, as is contained in Scripture; and in an abstract of their history, an abstract of that abstract, and four critical essays. In 1725 he published, in 8vo, *An Essay on the several Dispensations of God to Mankind*. He sometimes spoke in parliament, but appears not to have been a frequent speaker. He died at his seat in Berkshire, after a short illness, December 4, 1734, in the 66th year of his age.

He married Anne, eldest daughter of Sir William Daines, by whom he left six sons and three daughters. William, his eldest son, succeeded to his father's honours; was elected, soon after he came of age, member for the town of Berwick, and afterwards for Plymouth; and, in the late and present reigns, has passed through the successive offices of lord of the admiralty, master of the wardrobe, chancellor of the exchequer, treasurer of the navy, and secretary at war. Francis, the second, died young. John, the third, was a major-general in the army, commanded the land forces at the reduction of the island of Guadaloupe, in 1758, and died in 1764. Daines, the fourth, king's counsel, and one of the justices of the grand session for the counties of Chester, &c. is author of, 1. *Observations upon the Ancient Statutes*, 1766; a valuable work, reprinted in the same year, and again in 1769 and 1775. 2. *The Naturalist's Journal*, 1767, 4to. 3. *Directions for collecting Specimens of Natural History*, 1772, 4to. 4. *The Anglo-Saxon Version of Orosius, with an English Translation and Notes*, 1773, 8vo. 5. *Several Tracts relative to the Probability of reaching the North Pole*, 4to. 1775, &c. which are collected and enlarged in a volume of *Miscellanies*, 1780, 4to. 6. *Proposed Forms of Registers for Baptisms and Burials*, 1781, 4to. He is also author of many curious papers in the philosophical transactions, and *Archæologia*; some of which are likewise incorporated in the volume of *Miscellanies*.—Samuel, the fifth, was vice admiral of the white, and greatly distinguished himself in the three last wars. Shute, the sixth, had his education at Eton school, and the university of Oxford; took orders in 1756, the degree of LL.D. in 1762, was promoted to the bishopric of Llandaff in 1769, and translated to Salisbury in 1782.

BARRINGTON (Samuel), a British admiral, was fifth son of John the first Lord Viscount Barrington, by Anne, daughter and coheir of Sir William Daines. The family was originally Norman, and of great antiquity and respect; their name was Shute, and many honourable memorials of their eminence, both in arms and letters, are preserved in Normandy, as well as in England: one of the ancestors of Admiral Barrington was a judge in the reign of Queen Elizabeth. The admiral's father, being adopted by Francis Barrington, esq. of Tots in the county of Essex, who married his cousin, on succeeding to the estate, assumed, in compliance with the terms of the settlement, the name and arms of Barrington: this too was a family of great honour

and distinction, united in blood with the Plantagenets, by a marriage with the great grand-daughter of the Duke of Clarence, brother to Edward IV. Besides the Barrington estate, he inherited the property of John Wildman, esq. of Beckett in the county of Berks, and was raised to the peerage in 1720. The Honourable Samuel Barrington was born in the year 1720; electing the naval profession, he was in 1747 appointed a post captain, and colonel of the Chatham division of marines in 1770. In the room of Lord Howe, who was then made an admiral. On the 23d of January, 1778, he was created rear-admiral of the white, and on the 20th of the same month, rear-admiral of the red. He was immediately sent to the West Indies, where his valour, prudence, and good conduct, gained him the highest reputation: he distinguished himself particularly in the arduous and important exploit of taking St. Lucia in 1778, an enterprise so difficult, and exposed to such opposition, as would have rendered a failure perfectly excusable. While on this station he was, in the month of February, 1779, appointed vice-admiral of the blue, and in September, 1780, vice-admiral of the white. The ferment of parties during the last war occasioned many unexpected refusals of promotion, and as Admiral Barrington was intimately connected with Lord Shelburne, Colonel Barry, and several other leading men in opposition, it may possibly be attributed to this circumstance that he refused the command of the Channel fleet, which was offered to him after the resignation of Admiral Geary in August, 1783, and on his declining to accept it, conferred on Admiral Darby. In 1782 he served under Lord Howe, and distinguished himself in the memorable relief of Gibraltar. The termination of the war put a period to Admiral Barrington's active services. In February, 1786, he was made lieutenant-general of marines; and on the 24th of September, 1787, admiral of the blue. During the last ten years, his ill state of health obliged him to decline all naval command; but as he was in the strictest habits of intimacy with the then illustrious commander of the Channel fleet, it is to be supposed that the benefit of his talents and experience was not entirely lost to the country. Admiral Barrington was never married: he died the 16th of August, 1801. Few families have displayed so much of talent and success as that of Barrington, during the last generation. John, the first viscount, was a man of great abilities, and an elegant writer: his second son died young; his third attained the rank of major-general, and was lieutenant-governor of Berwick; his fourth, Daines, was an author of great eminence, king's counsel, a Welsh judge, and judge of Chester; his sixth son, Shute, was successively bishop of Llandaff, Salisbury, and Durham, which see he now fills.

BARROW (Isaac), bishop of St. Asaph, in the reign of Charles II. was son of Isaac Barrow, of Spiney-abbey in Cambridgeshire, and uncle of the famous Dr. Isaac Barrow, master of Trinity College, in Cambridge. He had his education in Peter-house, in Cambridge, and became fellow of that college; but was ejected by the Presbyterians, about the year 1643; whereupon going to Oxford, he was appointed one of the chaplains of New College, by the Warden Dr. Pink. It is said he was created bachelor of divinity in that university, the 23d of June, 1646; but his name is not to be found in the register. He continued at Oxford till the garriſon of that place surrendered to the parliament, after which time he shifted from place to place, and suffered with the rest of the royal and orthodox clergy till the restoration of King Charles II. when he was not only restored to his fellowship in Peter-house, but elected likewise one of the fellows of Eton College, near Windsor: July the 5th, 1663, he was consecrated bishop of the Isle of Man, in Henry VIII's chapel,

at Westminster; and the year following he was appointed, by Charles earl of Derby, governor of the Isle of Man; which office he discharged with great reputation all the time he held that see, and some time after his translation to that of St. Asaph. He held his fellowship of Eton in commendam with the bishopric of Man, and was a considerable benefactor to that island, and especially the clergy thereof. Afterwards going into England for the sake of his health, and lodging in a house belonging to the Countess of Derby, in Lancashire, called Cross-hall, he there received the news of his majesty's conferring on him the bishopric of St. Asaph, to which he was translated March 21st, 1660, and to which diocese he was no inconsiderable benefactor. This worthy prelate died in the 67th year of his age, at Shrewsbury, the 24th of June, 1680.

BARRY (Girald), commonly called *Giraldus Cambrensis*, i. e. *Girald of Wales*, an historian and ecclesiastic in the reigns of Henry II. and Richard I. was born at the castle of Mainarper, near Pembroke, A. D. 1146. By his mother he was descended from the princes of South Wales; and his father, William Barry, was one of the chief men of that principality. Being a younger brother, and intended for the church, he was sent to St. David's, and educated in the family of his uncle, who was bishop of that see. He acknowledges, in his history of his own life and actions, that in his early youth he was too playful; but being severely reproached for it by his preceptors, he became a very hard student, and greatly excelled all his school-fellows in learning. When he was about 20 years of age, he was sent, A. D. 1166, for his further improvement, to the university of Paris; where he continued three years, and became, according to his own account, a most excellent rhetorician; which rendered him very famous. On his return into Britain, he entered into holy orders, and obtained several benefices both in England and Wales. Observing, with much concern, that his countrymen, the Welsh, were very backward in paying the tithes of wool and cheese, which he was afraid would involve them in eternal damnation, he applied to Richard archbishop of Canterbury, and was appointed his legate in Wales for rectifying that disorder, and for other purposes. He executed this commission with great spirit; excommunicating all, without distinction, who refused to save their souls by surrendering the tithes of their cheese and wool. Not fastidious with enriching, he also attempted to reform the clergy; and dilated the Archdeacon of Brechin to the archbishop, for the unpardonable crime of matrimony; and the poor old man, refusing to put away his wife, was deprived of his archdeaconry; which was bestowed upon our zealous legate. In discharging the duties of this new office, he acted with great vigour, which involved him in many quarrels; but, if we may believe himself, he was always in the right, and always victorious. His uncle, the bishop of St. David's, dying, A. D. 1176, he was elected his successor by the chapter; but this election having been made without the permission, and contrary to the inclination of Henry II. our author prudently declined to insist upon it, and went again to Paris to prosecute his studies, particularly in the civil and canon law, and theology. He speaks with great raptures of the prodigious fame he acquired by his eloquent declamations in the schools, and of the crowded audiences who attended them, who were at a loss to know whether the sweetness of his voice, the beauty of his language, or the irresistible force of his arguments, were most to be admired. Having spent about four years at Paris, he returned to St. David's; where he found every thing in confusion; and the bishop being expelled by the people, he was appointed administrator by the Archbishop of Canterbury, and governed the diocese in that capacity to A. D. 1184, when the bishop was restored. About the same time he was called to court by Henry II. appointed one of his chap-

lains, and sent into Ireland, A. D. 1185, with Prince John. By this prince he was offered the united bishoprics of Fernes and Leighlin; but declined them, and employed his time in collecting materials for his Topography of Ireland, and his History of the conquest of that island. Having finished his Topography, which consisted of three books, he published it at Oxford, A. D. 1187, in the following manner, in three days. On the first day he read the first book to a great concourse of people, and afterwards entertained all the poor of the town; on the second day he read the second book, and entertained all the doctors and chief scholars; and, on the third day, he read the third book, and entertained the younger scholars, soldiers, and burghers. "A most glorious spectacle!" (says he), which revived the ancient times of the poets, and of which no example had been seen in England." He attended Baldwin archbishop of Canterbury in his progress through Wales, A. D. 1186, in preaching a crusade for the recovery of the Holy Land; in which, he tells us, he was far more successful than the primate; and particularly, that the people were prodigiously affected with his Latin sermons, which they did not understand, melting into tears, and coming in crowds to take the cross. Although Henry II. as our author assures us, entertained the highest opinion of his virtues and abilities, yet he never would advance him to any higher dignity in the church, on account of his relation to the princes and great men of Wales. But on the accession of Richard I. A. D. 1189, his prospects of preferment became better; for he was sent for by that prince into Wales to preserve the peace of that country, and was even joined in commission with William Longchamp, bishop of Ely, as one of the regents of the kingdom. He did not, however, improve this favourable opportunity; refusing the bishopric of Bangor in A. D. 1190, and that of Landaff the year after, having fixed his heart on the see of St. David's, the bishop of which was very old and infirm. In A. D. 1192, the state of public affairs, and the course of interest at court, became so unfavourable to our author's views, that he determined to retire. At first he resolved to return to Paris to prosecute his studies; but meeting with some difficulties in this, he went to Lincoln, where William de Monte read lectures in theology with great applause. Here he spent about six years in the study of divinity, and in composing several works. The see of St. David's, which had long been the great object of his ambition, became vacant, A. D. 1198, and brought him again upon the stage. He was unanimously elected by the chapter; but met with so powerful an adversary in Hubert archbishop of Canterbury (who opposed his promotion with great violence), that it involved him in a litigation, which lasted five years, cost him three journeys to Rome, at a great expence, and in which he was at last defeated, A. D. 1203. Soon after this he retired from the world, and spent the last 17 years of his life in a studious privacy, composing many books, of which we have a very correct catalogue in the Biographia Britannica. That Girald of Wales was a man of uncommon activity, genius, and learning, is undeniable; but these and his other good qualities were much tarnished by his insufferable vanity, which must have been very offensive to his contemporaries, as it is highly disgusting to his readers.

BARSANTI (Francisco), an eminent musical performer and composer, was born at Lucca about the year 1690. He studied the civil law in the university of Padua; but, after a short stay there, chose music for his profession. Accordingly he put himself under the tuition of some of the ablest masters in Italy; and having attained to a considerable degree of proficiency in the science of practical composition, took a resolution to settle in England, and came thither with Geminiani, who was also a Lucesse, in the year 1714. He was a good

performer on the hautboy, and also on the flute; in the former capacity he found employment in the opera band, and in the latter derived considerable advantages by teaching. He published, with a dedication to the Earl of Burlington, six solos for a flute with a thorough-bass, and afterwards six solos for a German flute and a bass. He also made into sonatas, for two violins and a bass, the first six solos of Geminiani. He continued many years a performer at the opera-house; at length, reflecting that there was a prospect of advantage for one of his profession in Scotland, he went thither; and, with greater truth than the fame is ascribed of David Rizzio, may be said to have meliorated the music of this country, by collecting and making basses to a great number of the most popular Scots tunes. About the year 1750 Barfanti returned to England; but, being advanced in years, he was glad to be taken into the opera band as a performer on the tenor violin; and in the summer season into that of Vauxhall. At this time he published twelve concertos for violins; and shortly after, *Sei Antifone*, in which he endeavoured to imitate the style of Palestrina, and the old composers of motets; but from these publications so little profit resulted, that, towards the end of his life, the industry and economy of an excellent wife, whom he had married in Scotland, and the studies and labours of a daughter, whom he had qualified for the profession of a singer, but who became an actress at Covent-Garden, were his chief support.

BARTAS (William de Saluste du), a French poet, who lived in the 16th century. He was employed by Henry IV. of France in England, Denmark, and Scotland; and commanded a troop of horse in Gascony, under the Marechal de Montignan. He was a Calvinist; and died in 1590, aged 46. He wrote a great number of poems; the most famous of which are, 1. *The Week*, or the Creation of the World, in seven books. 2. *The Poem of Judith*; and, 3. *The Battle of Ivry*, gained by Henry IV. in 1590. Du Bartas wrote in a bombast style.

BARTH, or BART (John), a brave fisherman of Dunkirk, who rose to the rank of an admiral; and is celebrated for his signal valour and naval exploits, in the annals of France. He died in 1702, aged 51.

BARTHIUS (Caspar), a very learned and copious writer, born at Custrin in Brandenburg, the 22d of June, 1576. Mr. Baillet has inserted him in his *Enfens Célèbres*; where he tells us, that at 12 years of age he translated David's Psalms into Latin verse of every measure, and published several Latin poems. Upon the death of his father (who was professor of civil law at Francfort, counsellor to the Elestor of Brandenburg, and his chancellor at Custrin) he was sent to Gotha, then to Eisenach, and afterwards, according to custom, through all the different universities in Germany. When he had finished his studies, he began his travels; he visited Italy, France, Spain, England, and Holland, improving himself by the conversation and works of the learned in every country. He studied the modern as well as ancient languages, and his translations from the Spanish and French shew that he was not content with a superficial knowledge. Upon his return to Germany, he took up his residence at Leipzig, where he led a retired life, his passion for study having made him renounce all sort of employment. He wrote a vast number of books; the principal of which are, 1. His *Adversaria*, a large volume in folio; the second and third volumes of which he left in manuscript. 2. A Translation of *Æneas* Gæzæus. 3. A large volume of Notes upon Claudian, in 4to. 4. Three large volumes upon Statius, &c. He died at Leipzig in 1658, aged 71.

BARTHOLINUS (Caspar), a learned physician and anatomist in the 17th century, was born at Malmoe, a town in the Vol. X.

province of Schonen, which then belonged to Denmark. At three years of age he had such a quick capacity, that in 14 days he learned to read; and in his 13th year he composed Greek and Latin orations, and pronounced them in public. When he was about 18, he went to the university of Copenhagen, and afterwards studied at Rostock and Wirtenberg. He next set out upon his travels; during which he neglected no opportunity of improving himself at the different universities to which he came, and every-where receiving marks of respect. He was in 1613 chosen professor of physic in that university, which he enjoyed 11 years; when, falling into a dangerous illness, he made a vow, that if it should please God to restore him, he would solely apply himself to the study of divinity. He recovered, and kept his word; and soon after obtained the professorship of divinity, and the canonry of Rostock. He died July 13, 1629, after having written several small works, chiefly on metaphysics, logic, and rhetoric.

BARTHOLINUS (Thomas), a celebrated physician, son of the former, was born at Copenhagen in 1616. After studying some years in his own country, he in 1637 went to Leyden, where he studied physic during three years. He then travelled into France; and resided two years at Paris and Montpellier, in order to improve himself under the famous physicians of those universities. Afterwards going to Italy, he continued three years at Padua; and at length went to Basil, where he obtained the degree of doctor of philosophy. Soon after he returned to Copenhagen; where, in 1647, he was appointed professor of the mathematics; and next year was nominated to the anatomical chair, an employment better suited to his genius and inclination; which he discharged with great assiduity for 13 years, and distinguished himself by making several discoveries with respect to the lacteal veins and lymphatic vessels. His close application, however, having rendered his constitution very infirm, he, in 1661, resigned his chair; but the king of Denmark allowed him the title of *honorary professor*. He now retired to a little estate he had purchased at Hagested, near Copenhagen, where he hoped to have spent the remainder of his days in peace and tranquillity; but his house being burnt in 1650, his library, with all his books and manuscripts, was destroyed. In consideration of this loss, the king appointed him his physician, with a handsome salary, and exempted his land from all taxes; the university of Copenhagen also appointed him their librarian; and in 1675 the king did him the honour to give him a seat in the grand council of Denmark. He wrote, 1. *Anatomia Caspari Bartholini Parentis novis Observationibus primum locupletata*, 8vo. 2. *De Monstris in Natura et Medicina*, 4to. 3. *De Armillis Veterum, præsertim Danorum Schedium*, 8vo.; and several other works. This great man died on the 4th of December, 1680.

BARTHOLOMEW ISLE, a small island, one of the New Hebrides, lying in Bougainville's Passage, between Mallicolo and the Tierra del Espíritu Santo of Quiros. Long. 167. 24. E. Lat. 15. 42. S.

BARTOLOCCI (Julius), a learned monk, and professor of Hebrew at Rome, was born at Celeno in 1613; and distinguished himself by writing an excellent Hebrew and Latin catalogue of the Hebrew writers and writings, in four volumes, a continuation of which was performed by Imbonati his disciple. He died in 1687.

BARTON (Elizabeth), commonly called The Holy Maid of Kent, was a religious impostor in the reign of Henry VIII. whose history may be very edifying. She was a servant at Aldington in Kent, and had long been troubled with convulsions, which distorted her limbs and countenance in the strangest manner, and threw her body into the most violent agitations; and the effect of the disorder was such, that even after the recovered she counterfeited the same appearance.

Masters, the minister of Aldington, with other ecclesiastics, thinking her a proper instrument for their purpose, persuaded her to pretend that what she said and did was by a supernatural impulse, and taught her to act her part in the most perfect manner. Thus she would lie as it were in a trance for some time; then, coming to herself, after many strange contortions, would break out into pious ejaculations, hymns, and prayers; sometimes delivering herself in set speeches, sometimes in uncouth monkish rhymes. She pretended to be honoured with visions and revelations, to hear heavenly voices, and the most ravishing melody. She declaimed against the wickedness of the times, against heresy and innovations; exhorting the people to frequent the church, to hear masses, to use frequent confessions, and to pray to our lady, and all the saints. All this artful management, together with great exterior piety, virtue, and austerity of life, not only deceived the vulgar, but many far above the vulgar, such as Sir Thomas More, Bishop Fisher, Archbishop Warkam; the last of whom appointed commissioners to examine her. She was now instructed to say, in her counterfeit trances, that the blessed Virgin had appeared to her, and assured her that she should never recover till she went to visit her image, in a chapel dedicated to her in the parish of Aldington. Thither the accordingly repaired, processional, and in pilgrimage, as it were, attended by above three thousand people, and many persons of quality of both sexes. There she fell into one of her trances, and uttered many things in honour of the saints, and the Popish religion: for herself she said, that, by the inspiration of God, she was called to be a nun, and that Dr. Bocking was to be her ghostly father. Dr. Bocking was a canon of Christchurch, in Canterbury, and an associate in carrying on the imposture. Meanwhile, the archbishop was so satisfied with the reports made to him about her, as to order her to be put into the nunnery of St. Sepulchre, Canterbury; where she pretended to have frequent inspirations and visions, and also to work miracles for all such as would make a profitable vow to our Lady, at the aforesaid chapel, in the parish of Aldington.

The priests, her managers, having thus succeeded in the imposture, now proceeded to the great object of it; and Elizabeth Barton was directed publicly to announce, how God had revealed to her, that, "in case the king should divorce Queen Catherine of Arragon, and take another wife during her life, his royalty would not be of a month's duration, but he should die the death of a villain." Bishop Fisher, and others, in the interest of the queen, and of the Romish religion, hearing of this, held frequent meetings with the nun and her accomplices, and at the same time seduced many persons from their allegiance, particularly the fathers and nuns of Sion, the Charterhouse, and Sheen, and some of the observants at Richmond, Greenwich, and Canterbury. One Peto, preaching before the king at Greenwich, denounced heavy judgments against him to his face; telling him, that "he had been deceived by many lying prophets, while himself, as a true Micaiah, warned him, that the dogs should lick his blood, as they had licked the blood of Ahab." Henry bore this outrageous insult with a moderation very remarkable for him: but, to undeceive the people, he appointed Dr. Curwin to preach before him the Sunday following, who justified the king's proceedings, and branded Peto with the epithets of "rebel, slanderer, dog, and traitor." Curwin, however, was interrupted by a friar, and called "a lying prophet, who sought to establish the succession to the crown upon adultery;" and he proceeded with such virulence, that the king was obliged to interpose, and command him to be silent: yet, though Peto and the friar were afterwards summoned before the council, they were only reprimanded for their insolence.

Encouraged by this lenity of the government, the ecclesi-

astics in this conspiracy resolved to publish the revelations of the nun, in their sermons, throughout the kingdom: they had communicated them to the pope's ambassadors, to whom also they introduced the maid of Kent; and they exhorted Queen Catharine to persist in her resolutions. At length this confederacy began to be a very serious affair, and Henry ordered the maid and her accomplices to be examined in the star-chamber. Here they confessed all the particulars of the imposture, and afterwards appeared upon a scaffold erected at St. Paul's Cross, where the articles of their confession were publicly read in their hearing. Thence they were conveyed to the Tower, until the meeting of parliament; who, having considered the affair, pronounced it a conspiracy against the king's life and crown. The nun, with her confederates, Masters, Bocking, Deering, &c. were attainted of high treason, and executed at Tyburn, April 20, 1534; where the confessed the imposture, laying the blame on her accomplices the priests, and craving pardon of God and the king.

BARWICK (John), an eminent English divine in the seventeenth century, and dean of St. Paul's, was born at Wetherlack, a little village in Westmoreland, the 20th of April, 1612. He was sent to Sedberg school in Yorkshire, where, under the care of a tolerable master, he gave early marks both of genius and piety. In the year 1631, and the eighteenth of his own age, he was admitted of St. John's College at Cambridge, under the tuition of Mr. Thomas Fothergill, who proved at once a guardian and a preceptor, supplying his necessities as well as instructing him in learning. In 1635 he became bachelor of arts, and April the 5th, 1636, he was created fellow. In 1638 he took the degree of master of arts. When the civil war broke out, and the king wrote a letter to the university, acquainting them that he was in extreme want, Mr. Barwick concurred with those loyal persons who first sent him a small supply in money, and afterwards their college plate; and upon information had, that Mr. Cromwell, afterwards the Protector, lay with a party of foot at a place called Lower Hedges, between Cambridge and Huntingdon, in order to make himself master of this small treasure, Mr. Barwick made one of the party of horse which conveyed it through by-roads safely to Nottingham, where his majesty had set up his standard. By this act of loyalty, the parliament was so provoked, that they sent Cromwell with a body of troops to quarter in the university, where they committed such outrages, as would scarcely have been credible in succeeding times, if Mr. Barwick, in conjunction with many other learned members of that celebrated society, had not transmitted an authentic account of them to posterity. Mr. Barwick also published a piece against the Covenant, and having thereby provoked such as were then in power, he thought proper to retire to London, there to render all the service that he was able to the royal cause. Soon after he settled there, he was intrusted with the management of the king's most private concerns, and carried on with great secrecy a constant correspondence between London and Oxford, where the king's head-quarters then were: a nice and arduous employment, and for which there never was a man better fitted than he. When his majesty came to be confined in Carisbrook castle, in the isle of Wight, so closely, that guards were posted at all the avenues to his chamber, and even at his windows, to prevent his having any correspondence, Mr. Cresset, who was placed about him through the dexterous management of Mr. Barwick, defeated all their diligence, and preserved his majesty a free intercourse with his friends: for this purpose he first deposited with Mr. Barwick a cypher, and then hid a copy of it in a crack of the wall in the king's chamber. By the help of this cypher, the king both wrote and read many letters every week, all of which passed through the hands of Mr. Barwick. He lived

was concerned in a very well-laid design for procuring the king's escape, which however was unluckily disappointed.

When the king was murdered, and the royal cause seemed to be desperate, Mr. Barwick still kept up his spirits, and though harassed with a continual cough, followed by a spitting of blood, and afterwards by a consumption of his lungs, yet would not interrupt the daily correspondence he maintained with the ministers of King Charles II. He was afterwards committed to the Tower, and put in a dungeon, where he was not only kept from pen, ink, and paper, and all books but the bible, with restraint from seeing any person except his keepers, but, as an additional punishment, had boards nailed before his window to prevent the coming in of the fresh air. In this melancholy situation he remained many months, during which time the diet he used was herbs or fruit, or thin water-gruel made of oat-meal or barley, with currants boiled in it, and sweetened with a little sugar, by which he recovered beyond all expectation, and grew plump and fat. A cure so perfect, and withal so strange, that many physicians have taken notice of it in their writings, as a most pregnant instance of the power of temperance, even in the most inveterate diseases. While he was thus shut up, his friends laboured incessantly for his service and relief, and his majesty King Charles II. for whom he thus suffered, gave the highest testimonies of his royal concern for so faithful a subject. After fifteen months passed in this strict confinement, Mr. Otway, and some other friends, procured a warrant from President Bradshaw to visit him, who were not a little surprised to find him so luffy, and in so good health, whom they had seen brought so low, as to engage this very Mr. Otway to take care of his burial. Through the friendly intercession of Mr. West, the lieutenant of the Tower, he was discharged on the 7th of August, 1652. When the church of England was restored in all its beauty by King Charles II. the deans and chapters revived, Dr. Barwick, according to his usual modesty, contented himself with recommending his tutor, old Mr. Fothergill, to a prebend in the cathedral church of York: but as to himself, he would have rested content with the provision made for him by his late patron the Bishop of Durham, who had given him the fourth stall in his cathedral, and the rectories of Wolsingham and Houghton in le Spring. Being made dean of St. Paul's, he took possession of the deanery about the middle of October, 1661, and found, as he expected, all in very great disorder with respect to the church itself, and every thing that concerned it. He set about reforming these abuses with a truly primitive spirit, and prosecuted with great vigour the recovery of such revenues, as in the late times of distraction had been alienated from the church; though with respect to his own particular concerns, he was never rigid to any body, but frequently gave up things to which he had a clear title. He was appointed one of the nine assistants to the twelve bishops, commissioned to hold a conference with the like number of presbyterian ministers upon the review of the liturgy; which conference was held at the Bishop of London's lodgings in the Savoy. He was also by the unanimous suffrage of all the clergy of the province of Canterbury, assembled in convocation, chosen prolocutor on the 18th of February, 1661: in which high office he behaved himself in such a manner, as added even to the great reputation he had before acquired. His application, however, to the discharge of so many and so great duties, brought upon him his old distemper, so that in November, 1662, he was confined to his chamber: he heightened his disease by officiating at the sacrament the Christmas-day following, after which he was seized with such a violent vomiting of blood, that he brought up whole basins full. Upon this he was advised to a change of air, for the enjoyment of which he retired to Therfield in Hertfordshire, of which he

was rector, but finding himself there too far from London, he returned to Chitwick, where he in some measure recovered his health. As soon as he found he had a little strength, he applied himself there to the putting in order the archives of St. Paul's church, and so threw himself down again. This was followed by an extraordinary flux of blood, which rendered him very weak, and defeated his favourite design of retiring to Therfield. When he first found his health declining, he made choice of and procured this living, intending to have resigned his deanery and office of prolocutor, to those who had vigour enough to discharge them, and to spend the remainder of his days in the discharge of his pastoral office, to which he thought himself bound by his taking orders. But Providence prepared for him a still more quiet mansion; for coming upon some extraordinary occasion to London, he was seized with a pleurisy, which carried him off in three days. He was attended in his last moments by Dr. Peter Gunning, afterwards bishop of Ely, and as he lived, so he died, with all the marks of an exemplary piety, on the 22d of October, 1664.

BARWICK (Peter), physician in ordinary to King Charles the Second. He was brother to John before mentioned, and was born some time in the year 1619, at Wetherlack in Westmoreland. He went to the same grammar school with his elder brother, till such time as he was fitted for the university, when he removed to St. John's College in Cambridge. This was about the year 1637, and he continued there about six years, being much farthered in his studies by the care taken of him by his brother. In 1642, being then in the twenty-fourth of his age, he took his degree of bachelor of arts. In 1644 he was nominated by the Bishop of Ely to a fellowship of St. John's, in his gift. In 1647 he took his degree of master of arts, applying himself then assiduously to the study of physic. In 1655 he was created doctor of physic, and two years afterwards, being then near forty, he took a house in St. Paul's Church-yard, and much about the same time married the widow of an eminent merchant, who was a near relation of Archbishop Laud's. Being thus settled, he soon gained a very great repute in the city, for his skill in his profession, as amongst the learned, by his judicious Defence of Dr. Harvey's Discovery of the Circulation of the Blood, which was then, and is still, admired as one of the best pieces written upon that subject. After the Restoration, in 1660, he was made one of the king's physicians in ordinary, and in the year following received a still stronger proof of his majesty's kind favour of his own and his brother's services. On the eighth of May, 1661, Dr. Gilbert Sheldon, then bishop of London, with several other bishops, deans, archdeacons, &c. met in the morning at our author's house, and proceeded thence to the cathedral of St. Paul's, in order to open the convocation. In 1666, being compelled by the dreadful fire to remove from St. Paul's Church-yard, where he had remained all the time of the plague, and been very active and serviceable in his profession, he thought proper to take another house near Westminster-abbey, for the sake of being near that cathedral, to which he constantly resorted every morning at six o'clock prayers. He was a very diligent physician, and remarkably successful in the small-pox, and in most kinds of fevers. Yet he was far from making money the main object of his care; for during the many years that he practised, he not only gave advice and medicines gratis to the poor, but likewise charitably administered to their wants in other respects. He was very kind to all who had suffered for the royal cause, to which he was a constant votary all his life; and with a view to its service, in 1671 he drew up in Latin, which he wrote with unusual elegance and purity, the Life of the Dean his brother, and took care to deposit it, and the original papers serving to support the facts therein mentioned, in the library in St. John's College at Cambridge.

Twenty years after this, when our author was in the seventy-fourth year of his age, and his eye-sight so much decayed, that he was forced to make use of the hand of a friend, he added an appendix in defence of the *Eikon Basilike*, against Dr. Walker, who was very well known to him, and of whom in that treatise he has given a very copious account. This piece of his is written with a good deal of asperity, occasioned chiefly by the frequency of scurrilous libels against the memory of Charles I. To this appendix, our author, as well as he could, subscribed his name. In 1694, growing quite dark, and being besides frequently afflicted with fits of the stone, he gave over practice, and dedicated the remainder of his life to the service of God, and the conversation of a few intimate friends, amongst whom Dr. Busby, the ever-famous master of Westminster school, was one. From this sedentary course of life, his old distemper, the stone, grew very much upon him, and toward the end of August, 1705, being seized with a vomiting and looseness, followed with an intermitting fever, and in a few days, with a great and sudden evacuation of blood, he exchanged this life for a better, the fourth of September, the same year, in the eighty-sixth year of his age.

BASAN (anc. geog.), a territory beyond Jordan, mentioned in scripture. By Josephus, Eusebius, and Jerom, it is called *Batanea*. On the entering of the Israelites into the land of Canaan, the whole of the country beyond Jordan, from that of the Moabites, or Arabia, as far as mount Hermon and Lebanon, was divided into two kingdoms, viz. that of Sihon King of the Amorites, and of Og king of Bashan or *Bashan*; the former to the south, and the latter to the north. The kingdom of Sihon extended from the river Arnon and the country of Moab, to the river Jabbok; which, running in an oblique course from the east, was at the same time the boundary of the Ammonites, as appears from Numb. xxi. 24. and Deuteron. ii. 37. and iii. 16. The kingdom of Sihon fell to the lot of the Reubenites and Gadites, and Bashan to the half-tribe of Manasseh. To this was annexed a part of the hilly country of Gilead, and the district of Argob; yet so that Bashan continued to be the principal and greatest part: but, after the Babylonish captivity, Bashan was subdivided; so that only a part was called *Batanea*, or *Bashan*, another *Trachonitis*, a third *Auramitis*, or *Iturea*, and some part also *Gaulonitis*; but to settle the limits of each of these parts is a thing now impossible.—Bashan was a country famous for its pastures and breed of large cattle.

BASIER, or **BASIRE** (Isaac), a learned and active divine in the seventeenth century, was born in the isle of Jersey in the year 1607. For some time he was master of the college or free-school at Guernsey; but, at length, became chaplain to Thomas Morton, bishop of Durham, who gave him the rectory of Stanhope, and the vicarage of Egglecliffe, both in the county of Durham. In July 1640 he had the degree of doctor of divinity conferred upon him at Cambridge, by mandate; and was incorporated in the same at Oxford the November following. About that time he was made chaplain in ordinary to King Charles I. On the 12th of December, 1643, he was installed into the seventh prebend in the church of Durham, to which he was collated by his generous patron Bishop Morton. The next year, on the 24th of August, he was also collated to the archdeaconry of Northumberland, with the rectory of Howick annexed. But he did not long enjoy these great preferments: for, in the beginning of the civil wars, being sequestered, persecuted, plundered, and forced to fly, he repaired to King Charles at Oxford, before whom, and his parliament, he frequently preached. In 1646 he had a licence granted him under the public seal of the university, to preach the word of God throughout England. Upon the surrender of the Oxford garrison to parliament, not

caring to stay any longer within the British dominions, he resolved to make a virtue of necessity, and to go and propagate the doctrine of the English church in the East, among the Greeks, Arabians, &c. Leaving therefore his family in England, he went first to Zante, an island near the Morea, where he made some stay; and had good success in spreading among the Greek inhabitants the doctrine of the English church, the sum whereof he imparted to several of them, in a vulgar Greek translation of our Church Catechism. The effect of it was so remarkable, that it drew envy, and consequently persecution, upon him from the Latins. This occasioned his voluntary retreat into the Morea, where the Metropolitan of Achaia prevailed upon him to preach twice in Greek, at a meeting of some of his bishops and clergy, which was well taken. At his departure he left him a copy of the catechism above mentioned. From thence, after he had passed through Apulia, Naples, and Sicily again (in which last, at Messina, he officiated for some weeks aboard a ship), he embarked for Syria; and after some months' stay at Aleppo, where he had frequent conversation with the patriarch of Antioch, then resident there, he left a copy of our Church Catechism, translated into Arabic, the native language of that place. From Aleppo he went in 1652 to Jerusalem, and so travelled over all Palestine. At Jerusalem he received much honour, both from the Greeks and Latins. Returning to Aleppo, he passed over the Euphrates, and went into Mesopotamia. Abraham's country, where he intended to send the Church Catechism in Turkish, to some of their bishops, who were mostly Armenians. This Turkish translation was procured by the care of Sir Thomas Bendish, the English ambassador at Constantinople. After his return from Mesopotamia, he wintered at Aleppo, where he received several courtesies from the consul, Mr. Henry Riley. In the beginning of 1653 he departed from Aleppo, and came to Constantinople by land, being six hundred miles, without either servant or christian, or any man with him, that could so much as speak the Frank language: yet, by the help of some Arabic he had picked up at Aleppo, he performed that journey in the company of 20 Turks, who used him courteously; the rather, because he was by the way physician to them and their friends. After his arrival at Constantinople, the French Protestants there desired him to be their minister. And, though he declared to them his resolution to officiate according to the English liturgy, yet they orderly submitted to it, and promised to settle on him, in three responsible men's hands, a competent stipend. Upon the restoration of King Charles II. Dr. Basier was recalled by his majesty to England, in a letter written to Prince Ragotzi. But this unfortunate prince dying soon after, of the wounds he received in a battle with the Turks at Gyala, the care of his solemn obsequies was committed to the doctor by his relict, Princess Sophia, whereby he was kept a year longer out of England. At length, returning in the year 1661, he was restored to his preferments and dignities; and made chaplain in ordinary to King Charles II. He wrote several books on divinity. Having for many years after the Restoration quietly enjoyed his large revenues, he died on the 12th of October, in the year 1676, and in the sixty-ninth year of his age.

BASILIPOTAMO, a river of Turkey in Europe, in the Morea, which falls into the gulf of Calochina. It was called *Eurotes* by the ancients.

BASILISCUS (*Encycl.*), in zoology, the trivial name of a species of lacerta: erroneously spelt **BASILICUS** in our original article.

BASILUZZO, one of the Lipari islands, in the Mediterranean, two miles in circumference, and uninhabited.

BASINGE (John), more commonly known by the name of Basingstochius, or de Basingstoke, was born at Basingstoke, a

town in the north part of Hampshire, and from thence took his surname. He was a person highly eminent for virtue and learning. For having very good natural parts, he so improved them by study, that he became a perfect master of the Latin and Greek languages, and also an eminent orator, a complete mathematician, a subtil philosopher, and a sound divine. The foundation of his great learning he laid in the university of Oxford, and, for his farther improvement, went to Paris, where he resided some years. Not satisfied with that, he travelled to Athens, that agreeable seat of the muses, and the mother of all polite literature, where he made many curious observations, and perfected himself in his studies, particularly in the knowledge of the Greek tongue. At his return from thence to England he brought over with him several curious Greek manuscripts, and introduced the use of the Greek numeral figures into this kingdom: He became also a very great promoter and encourager of the study of that language, which was much neglected in these western parts of the world: and to facilitate it, he translated from Greek into Latin a grammar, which he entitled, *The Donatus of the Greeks*. He died in the year 1252.

BASKERVILLE (Sir Simon), knight (of the ancient family of the Baskervilles in Herefordshire), an excellent scholar and eminent physician, famous for his skill in anatomy, and happy practice in the time of King James the First and King Charles the First, born at Exeter, 1573, was the son of Thomas Baskerville, an apothecary in that city, who observing an early love of knowledge and thirst after learning in his son, gave him a proper education for the university, to which he was sent at about eighteen years old, entering him in Exeter College in Oxford, on the 10th of March, 1591, putting him under the care of Mr. William Helm, a man no less famous for his piety than learning, under whose tutorship he gave such early proofs of his love of virtue and knowledge, that he was on the first vacancy elected fellow of that house, before he had taken his bachelor's degree in arts, which delayed his taking it till July the 8th, 1596, to which he soon after added that of arts-matter; and when he was admitted had particular notice taken of him (according to our author's own words) for his admirable knowledge in humanity and philosophy. After this, viz. 1606, he was chosen senior professor of the university; when he bent his study wholly to physic, in the knowledge of which useful faculty he became a most eminent proficient, and was then in as great esteem at the university for his admirable knowledge in medicine, as he had been before for other parts of learning, taking at once by accumulation (on the 20th of June, 1611) both his degrees therein, viz. that of bachelor and doctor. After many years' study and industry, leaving the university, he came to London, where he became of great eminency in his profession; being a member of the College of Physicians, and for some time also president thereof. His high reputation for learning, great skill and good success in physic, soon brought him in vogue at court, where he was sworn physician to King James the First, and afterwards to King Charles the First; with whom he was in such esteem for his learning and accomplishments, that he conferred the honour of knighthood upon him. He died July the 5th, 1641, aged sixty-eight years.

BASNAGE (James), a learned and accomplished author, and pastor of the Walloon church at the Hague, was born at Rouen in Normandy, August 8, 1653. He was the son of Henry Basnage, one of the ablest advocates in the parliament of Normandy. At 17 years of age, after he had made himself master of the Greek and Latin authors, as well as the English, Spanish, and Italian languages, he went to Geneva, where he began his divinity studies under Mestrezat, Turretin, and Tronchin; and finished them at Sedan, under the professors Jurieu and

Le Blanc de Beaulieu. He then returned to Roan, where he was received as minister, September 1676; in which capacity he remained till the year 1685, when the exercise of the Protestant religion being suppressed at Rouen, he obtained leave of the king to retire to Holland. He settled at Rotterdam; and was a minister pensionary there till 1691, when he was chosen pastor of the Walloon church of that city. In 1709 pensionary Heinſius got him chosen one of the pastors of the Walloon church at the Hague, intending not only to employ him in religious but in state affairs. He was employed in a secret negotiation with marshal d'Uxelles, plenipotentiary of France at the congress of Utrecht; and he executed it with so much success, that he was afterwards entrusted with several important commissions, all which he discharged in such a manner as to gain a great character for his abilities and address; a celebrated modern writer has therefore said of him, that he was fitter to be minister of state than of a parish. The abbé du Bois, who was at the Hague in 1716, as ambassador plenipotentiary from his most Christian majesty, to negotiate a defensive alliance between France, England, and the States General, was ordered by the duke of Orleans, regent of France, to apply himself to M. Basnage, and to follow his advice: they accordingly acted in concert, and the alliance was concluded in January 1717. He kept an epistolary correspondence with several princes, noblemen of high rank, and ministers of state, both Catholic and Protestant, and with a great many learned men in France, Italy, Germany, and England. The Catholics esteemed him no less than the Protestants; and the works he wrote, which are mostly in French, spread his reputation almost all over Europe: among these are, 1. *The History of the Religion of the Reformed Churches*; 2. *Jewish Antiquities*; 3. *The History of the Old and New Testament*; and many others. He died Sept. 22, 1723.

BASNAGE (Henry), sieur de Beaulieu, second son to Henry Basnage, and brother to James mentioned in the last article. He applied himself to the study of the law, and was admitted advocate in the parliament of Rouen in the year 1679. He did not follow the bar immediately upon his admission; but went to Valencia, where he studied under M. de Marville. Upon his return from thence he practised with great reputation till the year 1687, when the revocation of the edict of Nantz obliged him to fly to Holland, where he composed the greatest part of his works, and died there the 29th of March, 1710. His chief work is *Histoire des Ouvrages des Savans*. Rotterdam, 24 vols. in duodecimo. This work was begun in the month of September 1687, and continued till June 1709. When he arrived in Holland, Mr. Bayle, through indisposition, had been obliged to drop his *Nouvelles de la République des Lettres*, which induced Mr. Basnage to undertake a work of the same kind under a different title.

BASNET (Edward), dean of St. Patrick's, Dublin, was an active man at the time of the Reformation, and a privy-councillor to King Henry VIII. and King Edward VI. He was descended of an esquire's family, long seated at Eaton, in the county of Denbigh, in Wales, and had some relations in Ireland, who probably came over with him; for we find no such names in history or records planted in Ireland before his time. He was presented by King Henry VIII. to the vicarage of Swords, in the diocese of Dublin, on the 11th of May, 1535, during the vacancy of that see, by the murder of Archbishop Allen, and this is the first promotion we find he had in Ireland; so that in all probability he came over the year before, in the retinue and under the countenance of Sir William Skeffington, lord deputy. About the latter end of April 1537, he was elected by the chapter dean of the cathedral of St. Patrick's, Dublin, that dignity being void on the 8th of the same month by the death of Geoffrey Fitche, his predecessor;

and this promotion gave him a rank almost equal to the episcopal. He was styled Sir Edward Basset, and is so named in an act of parliament of that time; not that he had been created a knight, but was called so in the same sense as those that are called Sirs, who have taken the first degree in an university. In 1544 a report was made by the lord deputy about the singular merit of Dean Basset for the crown. For this the king was pleased to reward him with a grant, to him and his heirs, of the castle, town, lands, and rectory of Kilterman, in the marches of the county of Dublin, to hold in capite by the service of one knight's fee, for ever, and three shillings, Irish money, per annum, rent. In 1545, August the 20th, the king, as a mark of his royal indulgence, granted the dean a particular favour, in which his chapter, under his countenance, was concerned, which is registered among the records of the deanery. He died in the first year of Queen Mary's reign.

BASSANO, a town of Italy, in the territory of Venice, on the river Brante, in a country productive of excellent wine. Long. 11. 24. E. Lat. 45. 51. N.

BASSANTIN (James), a Scotch astronomer, son of the laird of Bassantin in Mers, was born in the reign of James IV. He was educated at the university of Glasgow, travelled through Germany and Italy, and then fixed his abode in the university of Paris, where he taught mathematics with great applause. Having acquired some fortune in this occupation in 1562, he returned to Scotland, where he died in the year 1568. From his writings, he appears to have been no contemptible astronomer, considering the times; but, like most of the mathematicians of that age, he was not a little addicted to judicial astronomy. Sir James Melvil, in his Memoirs, says that his brother Sir Robert, when he was exerting his abilities to reconcile the two queens, Elizabeth and Mary, met with one Bassantin, a man learned in the high sciences, who told him, "that all his travel would be in vain; for said he, they will never meet together; and next there will never be any thing but dissembling and secret hatred for a while, and at length captivity and utter wreck to our queen from England." He added, "that the kingdom of England at length shall fall, of right, to the crown of Scotland; but it will cost many bloody battles; and the Spaniards shall be helpers, and take a part to themselves for their labour." Sir James Melvil is an author of credit; therefore it is probable that our astrologer ventured to utter his prediction: but, as it proved true only in part, either he misunderstood the stars, or they deceived the astrologer—His works are, 1. *Astronomia Jacobi Bassantini Scoti, opus apologeticum, &c. ter editum Latine & Gallice*. Bassan, 1599, fol. This is the title given it by Tornæus, who translated it into Latin from the French, in which language it was first published. 2. *L'arabesque de l'Astrolabe, avec une Amplification de l'Usage de l'Astrolabe*. Lyons, 1555. Paris, 1677, 8vo. 3. *Mathematicæ Cœnebiacæ*. 4. *Arithmetica*. 5. *Musica secundum Platonem*. 6. *De Mathefi in genere*.

BASSETTHWAITE WATER, a fine lake in Cumberland, 3 miles N.W. of Kewick. It is 4 miles long, bounded on one side by high hills, wooded, in many places, to their bases; on the other by the fields, and the skirts of Skiddaw.

BASSETTERE, the capital of St. Christopher, a fine town, built by the French when this part of the island was in their possession, before it was ceded to the English in 1713. The houses are of brick, freestone, and timber; and among other buildings are a townhouse, an hospital, and a large church.

BASSETTERE, the principal town of Guadaloupe, in a district of the same name, in the W. part of the island. It is defended by a citadel and other fortifications.

BASSET (Peter), a gentleman of a good family, was chamberlain, or gentleman of the privy-chamber, to King Henry V.

a constant attendant on that brave prince, and an eye-witness of his most glorious actions both at home and abroad; all which he particularly described in a volume entitled, *The Acts of King Henry V.* which remains in MS. in the college of heralds.

BASSETT (Fulk), bishop of London in the reign of Henry III. was brother of Gilbert Bassett, one of the barons, who died by a fall from his horse, leaving behind him only one son, an infant, by whose death soon after the inheritance devolved to Fulk. In the year 1225 he was made provost of the collegiate church of St. John of Beverly, and in 1230 dean of York. In December 1241 he was elected by the chapter of London bishop of that see, in the room of Roger Niger, both in regard of his family and his great virtues, and notwithstanding the king's recommendation of Peter de Egueblanche, bishop of Hereford. The see of Canterbury being vacant at the time of this prelate's election, he was not consecrated till the 9th of October, 1244, at which time the solemnity was performed at London, in the church of the Holy Trinity. In the year 1250 Bishop Bassett began to have a warm dispute with Archbishop Boniface, concerning the right of metropolitan visitation; in the course of which he met with very rough treatment from the archbishop, and at last, after a long contest, thought it best to submit, and acknowledge his jurisdiction; but he succeeded better in the opposition he made to Rufus, the pope's legate, in 1255. In 1256 this prelate began to build the church of St. Faith, near that of St. Paul, on the spot which King John had formerly given to the bishops and chapter of London for a market. In the latter part of his life he is said to have inclined to the cause of the barons. He died of the plague in 1259, having sat near fifteen years from the time of his consecration.

BASTARD (Thomas), was born at Blandford in Dorsetshire, and educated at Winchester school, from whence he removed to New College, in Oxford, where he was chosen perpetual fellow in the year 1588, and two years after took the degree of bachelor of arts: but indulging too much his talent for satire, he was expelled the college for a libel. Not long after, being then in holy orders, he was made chaplain to Thomas earl of Suffolk, lord treasurer of England; through whose favour and interest he became vicar of Bere Regis, and rector of Amour, or Hamer, in his native county, having some time before taken the degree of master of arts. He was a person of great natural endowments, well skilled in the learned languages, a celebrated poet, and in his later years an excellent preacher. His conversation was witty and facetious, which made his company courted by all ingenious men. Towards the latter end of his life, being disordered in his senses, and thereby brought into debt, he was confined in the prison of All-Hallows parish, in Dorchester, where he died in April, 1618.

BASTERIA, ALL-SPICE; a genus of plants not described by Linnæus, but to which Mr. Miller has given the name of *Basteria* from Dr. Job Baster, F.R.S. a learned botanist of Holland. Of this there is only one species known, viz. with oval leaves placed opposite, flowers coming from the sides of the stalks, and a branched shrubby stalk. It is a native of Carolina in America. The flowers appear in May, are of a dull purple colour, and have a disagreeable scent. The bark is brown; and has a very strong aromatic flavour, from whence the plant takes its name of *All-spice*.

BASTIOGNE, a small town of the duchy of Luxemburg, 25 miles N.W. of Luxemburg, subject to the house of Austria. Long 6. 0. E. Lat. 50. 0. N.

BASTITANI (anc. geog.), a people of the province of Bætica in Spain. See BÆTICA.

BASTON (Robert), a Carmelite monk, afterwards prior of the convent of that order at Scarborough, and also poet laureat and public orator at Oxford, flourished in the fourteenth

century. King Edward I. in his expedition into Scotland in 1304, took Robert Bafton with him, in order to celebrate his victories over the Scots; but our poet being taken prisoner, was obliged to change his note, and fing the successes of Robert Bruce. He wrote several books in Latin, on the Wars of Scotland, the Luxury of Priests, Synodical Sermons, &c.; and also a volume of tragedies and comedies, in English. He died about the year 1310.

BASTWICK (Dr. John), born at Writtle in Essex, in 1593, practised physic at Colchester; but being a man of warm imagination, and a good Latin scholar, applied himself to writing books against popery. About the year 1633 he printed in Holland a Latin treatise entitled *Elenchus Religionis Papistice*, with *Flagellum Pontificis et episcoporum Latialium*, in which the English prelates thinking themselves also aimed at, he was fined 1000*l.* in the high commission court, excommunicated, prohibited practising physic, his books ordered to be burnt, and himself to remain in prison until he made a recantation. Instead of recanting, he wrote in prison, *Apologeticus ad persequens Anglicanæ*; and another book called, *The Litany*; wherein he severely exclaimed against the proceedings of that court, and taxed the bishops with an inclination towards popery. Prynne and Burton coming under the lash of the star chamber-court at the same time, they were all censured as scandalous seditious persons, condemned to a fine of 5000*l.* each, to be pillored, to lose their ears, and to perpetual imprisonment in three remote parts of the kingdom. The parliament in 1640 reversed these proceedings; and ordered Dr. Bastwick a reparation of 5000*l.* out of the estates of the commissioners and lords who had prosecuted him, which the ensuing confusions prevented his receiving: however, his wife had, in 1644, an allowance ordered for her and her husband's maintenance. What became of him afterward is not known.

BATACOLA, a sea-port on the coast of Malabar, between Onore and Barcelore. Here are the remains of a once considerable city, on the banks of a small river, four miles from the sea. The country round it produces a great quantity of pepper; and the English had a factory here till 1670, when a bull-dog belonging to the factory having unfortunately seized and killed a sacred cow, the natives rose and massacred them all.

BATAVORUM INSULA, the island of the Batavians (anc. geog.). Of this island Tacitus gives the following description. "The Rhine flowing in one channel, or only broken by small islands, is divided at its entering Batavia, as it were, into two rivers. One continues its course through Germany, retaining the same name, and violent current, till it falls into the ocean. The other washing the coast of Gaul, with a broader and more gentle stream, is called by the inhabitants *Vahalis*; which name it soon changes for that of *Mosa*, by the immense mouth of which river it discharges itself into the same ocean." According to Tacitus, therefore, the island of the Batavians was bounded by the ocean, the Rhine, and the *Vahalis*, now the *Wale*. Cæsar extends it to the *Mosa*, or *Meuse*; but Pliny agrees with Tacitus. However, this island was of greater extent in Tacitus's time than in Cæsar's; Drusus, the father of Germanicus, having by a new canal conveyed the waters of the Rhine into the ocean a considerable way north of the former mouth of that river. The Batavi were a branch of the Catti, who, in a domestic sedition, being expelled their country, occupied the extremity of the coast of Gaul, at that time uninhabited, together with this island situated among shoals. Their name *Batavi* they carried with them from Germany; there being some towns in the territory of the Catti called *Battenberg*, and *Battenhausen*. The bravery of the Batavi, especially the horse, procured them not only great honour from the Romans, being called their *brothers* and *friends*; but an exemption from taxes, being obliged only to

furnish men and arms. The modern name of this island is *Betu*, or *Betaw*. See BETUE and BATTÆ.

BATE (George), an eminent physician, born at Maid's Morton, near Buckingham, in the year 1608. In 1629 he obtained a licence, and for some years practised in and about Oxford: his practice was chiefly amongst the paritans, who at that time considered him as one of their party. In 1637 he took his degree of doctor in physic, and became very eminent in his profession, so that when King Charles kept his court at Oxford, he was his principal physician. When the king's affairs declined, Dr. Bate removed to London, where he accommodated himself so well to the times, that he became physician to the Charter-house, fellow of the college of physicians, and afterwards principal physician to Oliver Cromwell. Upon the restoration, he got into favour with the royal party, was made principal physician to the king, and fellow of the Royal Society; and this, we are told, was owing to a report raised on purpose by his friends, according to Mr. Wood, that he gave the protector a dose which hastened his death. Dr. Bate wrote in Latin an account of the late commotions in England, and some other pieces. He died at his house in Hatton-garden, and was buried at Kingston-upon-Thames in Surrey.—There was another George BATE, who wrote a work entitled *The Lives, Actions, and Execution, of the prime Actors and principal Contrivers of that horrid Murder of our late pious and sacred King Charles I.*

BATE (John), prior of the monastery of Carmelites, at York, in the 15th century, was born in Northumberland, and educated at York in the study of the liberal arts; in which he was greatly encouraged by the favour of some persons, his patrons, who were at the expence of sending him to Oxford, to finish his studies in that university. Bate abundantly answered the hopes conceived of him, and became an eminent philosopher and divine, and particularly remarkable for his skill in the Greek tongue. He took the degree of doctor in divinity at Oxford, and afterwards distinguished himself as an author. The Carmelites of York were so sensible of his merit, that upon a vacancy they offered him the government of their house; which he accepted, and discharged that office with great prudence and success. He died the 26th of January, 1420, in the beginning of the reign of Henry VI.

BATECUMBE, or BADECOMBE (William), an eminent mathematician, is supposed to have flourished about the year 1420, in the reign of Henry V. He studied at Oxford, where he applied himself to natural philosophy in general, but chiefly to the mathematics, in which he made a very great proficiency, as is evident by his writings in that science, which introduced him to the acquaintance and intimacy of the greatest men of those times. His mathematical writings consist of, 1. Of the Formation and Use of the Concave Sphere. 2. Of the Solid Sphere. 3. Of the Use of the Astrolabe. 4. Philosophical Conclusions.

BATEMAN (William), bishop of Norwich in the fourteenth century, and founder of Trinity-hall in Cambridge, was born at Norwich, being the son of a citizen of good repute in that place. He was from his tenderest years of a docile and ingenious disposition: having therefore made a good proficiency in learning, wherein he surpassed all his equals, he was sent to the university of Cambridge. After having gone through the usual circle of the sciences, he applied himself to the study of the civil law, in which he took the degree of doctor, before he was thirty years of age, a thing then uncommon. On the 8th of December, 1328, he was collated to the archdeaconry of Norwich: soon after this he went and studied at Rome, for his further improvement; and so distinguished himself by his knowledge and exemplary behaviour, that he was promoted by the pope to the place of auditor of his palace. He was likewise advanced by him to

the deanery of Lincoln; and so great an opinion had he of his prudence and capacity, that he sent him twice as his nuncio, to endeavour to procure a peace between Edward III. king of England, and the king of France. Upon the death of Anthony de Beck, bishop of Norwich, the pope died, by his usurped provisional authority, confer that bishopric upon our William Bateman, on the 23d of January, 1343, and consecrated him with his own hands. He was confirmed the 23d of June, 1344. Being invested with that great dignity, he returned into his native country after many years' absence, and lived in a regular, and withal in a generous and hospitable manner. Of Pope Clement VI. he obtained for himself and successors the first fruits of all vacant livings within his diocese; which occasioned frequent disputes between himself and his clergy. In the year 1347 he founded Trinity-hall in Cambridge, for the study of the civil and canon laws; and another hall dedicated to the Annunciation of the Virgin Mary, for the study of philosophy and divinity.

Being a person of great wisdom, eloquent, and of a fine address, he was often employed by the king, and parliament in affairs of the highest importance; and particularly was at the head of several embassies, sent on purpose to determine the great differences between the crowns of England and France. In 1354 he was by order of parliament dispatched to the court of Rome, with Henry duke of Lancaster, and others; to treat (in the pope's presence) of a peace, then in agitation between the two crowns above mentioned. This journey proved fatal to him; for he died at Avignon, where the pope then resided, on the 6th of January, 1354-5, and was buried with great solemnity in the cathedral church of that city. With regard to his person, he was of an agreeable countenance, tall, handsome, and well made. He was likewise a man of strict justice and piety, punctual in the discharge of his duty, and of a friendly and compassionate disposition.

BATES (William), D. D. an eminent Presbyterian divine, born in November 1625. He was admitted in Emanuel College, Cambridge, and from thence removed to King's College in 1644. He was one of the commissioners, at the conference in the Savoy, for reviewing the public liturgy, and was concerned in drawing up the exceptions against the Common Prayer: however, soon after the restoration, he was appointed chaplain to King Charles II. and became minister of St. Dunstan's in the West, but was deprived of that benefice for nonconformity. Dr. Bates bore a good and amiable character; and was honoured with the friendship of the lord keeper Bridgman, the lord chancellor Finch, the Earl of Nottingham, and Archbishop Tillotson. He was offered, at the restoration, the deanery of Litchfield; which he refused. He published *Select Lives* of illustrious and pious persons, in Latin; and since his death all his works, except his *Select Lives*, have been printed in one volume in folio. He died on July 14, 1699, in the 74th year of his age.

BATHE (Henry de), a learned knight, an eminent and skillful judiciary of the 13th century, was born at that ancient seat of this family, called Bathe-house, in the county of Devon. Being a younger brother, it is not unnatural to imagine he might, upon that account, apply himself to the study and profession of the laws of his country, in the knowledge of which he grew so eminent, that he was advanced by King Henry III. in 1238, to be one of the justices of the Common Pleas, and in 1246 was constituted one of the justices itinerant (as they were then called) for the county of Hertford, and in 1248 he was appointed the same for Essex and Surrey, in 1249 for Kent, Berks, Southampton, and Middlesex, and in 1250 for Lincolnshire; at which time he had allowed him out of the Exchequer, by a peculiar favour, an hundred pounds a year for his sustentation in the discharge of his office. But the year following he fell from the king's grace and favour,

the occasion of which were certain crimes laid to his charge; viz. that he had not exercised his office uprightly, but to his own private gain, having perverted justice through bribes; upon an occasion of a suit betwixt him and one Everard Trumpington, which was chiefly supported against him by one Philip d'Arcis, Knight, who also added treason to that of infidelity in his office. The accused was attached in the king's court; but one Manfel, who was now become a great favourite at court, offered bail for his appearance. King Henry refused this; the case, as he alleged, not being bailable, he terming him guilty of high treason. Fulk Basset, however, then bishop of London, and a great many of De Bathe's friends, interceding, the king at last gave orders that he should be bailed, twenty-four knights becoming sureties for his appearing, and standing to the judgment of the court. But De Bathe seems to have been conscious of his own demerits, or the prepossession of his judges against him; for he was no sooner left at liberty, than he wrote to all his relations either by blood or marriage, desiring that they would apply to the king in his favour, at first by fair speeches and presents, and that if these did not prevail, they should appear in a more warlike manner, thereby to intimidate the court. This they faithfully and unanimously promised to do, upon the encouragement given them by a bold knight, one Nicholas de Sandford: but the king, imagining that his own power, and the interest of De Bathe's accusers, infinitely outweighed all the preparations of the others, appeared the more inexorable upon the intimation of these proceedings; he rejected all presents from the friends of the accused, and put on an air as if nothing but his punishment should satisfy his and the nation's justice. De Bathe knew well to what all this outward inflexibility tended; but was certain, that if Henry persisted in his resolution, he himself must perish. He therefore had recourse to a more prudent measure; he applied himself to the Bishop of London, and other his special friends, and with a great posse of these goes to Richard earl of Cornwall (afterwards king of the Romans), whom by prayer and fine promises he won over to his interest. The king continued deaf to all his remonstrances, and about the end of February, De Bathe was summoned, and obliged to appear to answer what should be laid to his charge. This he accordingly did, but strongly defended by a great retinue of armed knights, gentlemen, and others, viz. his own and his wife's friends and relations; among whom was the family of the Bassets and Sandfords, a band as undaunted as his persecutors were violent. We may, from what our historian has delivered upon this occasion, conclude that the assembly was divided between those who depended upon the king for their posts and preferments, and those who, though a great majority, were so thoroughly exasperated at the measures of the court, that they were resolved not to find De Bathe guilty. It was not long before the king perceived this, and upon that occasion he made an unjust and impolitic stretch of his prerogative, in an unheard-of proclamation. A new charge was now brought against De Bathe, and perhaps the chief and only one, at least that had exasperated King Henry, viz. he was impeached not only on the former articles, but particularly for alienating the affections of the barons from his majesty, and creating such a ferment all over the kingdom, that a general sedition was now on the point of breaking out. This speech was enforced from Bathe's brother judiciary, who declared to the assembly, that he knew the accused to have dismissed without any censure, for the sake of lucre, a convicted criminal. Many other complaints were urged against De Bathe; but they seem to have been disregarded by all but the king and his party, who was so much exasperated to see De Bathe likely to be acquitted, that he mounted his throne, and with his own mouth made proclamation, That whosoever should kill Henry de Bathe, should have the royal pardon for

him and his heirs; after which speech he flung out of the room in a great passion. Many of the royal party, who were exceedingly keen upon this occasion, would readily have executed the king's terrible doom, and were for dispatching De Bathe in court; but his friend Mantel, one of the king's council, and Fulco Basset, bishop of London, interposed to effectually, that he was saved; and afterwards, by the powerful mediation of his friends (among whom was the Earl of Cornwall, the king's brother, and the Bishop of London), and the application of a sum of money; viz. two thousand marks to the king, he obtained not only a pardon, but all his former places and favour with the king, who re-established him in the same seat of judicature as he was in before; and rather advanced him higher, for he was made chief-justice of the King's Bench, after about three years' discontinuance from his office of a judge, in which honourable post he continued for eight years after, till the time of his death; which happened in 1261.

BATTIE (William), was born in Dublin, in 1564. We have it by tradition, that he was of a fullen, saturnine temper, and disturbed in his mind; that his family was reduced from its ancient splendour. His parents, who were Protestants, had a greater regard to the learning of their child, than his religion; and therefore put him, in his green years, under the tuition of an eminent Popish schoolmaster, who thoroughly corrupted his principles, and fitted him for that station of life which he afterwards embraced. He removed to Oxford, where he studied several years with indefatigable industry; but the inquisitive Anthony Wood could not discover in what college or hall he sojourned, or whether he took any university degree. The same writer alleges, that growing weary of the heresy professed in England (as he usually called the Protestant faith), he quitted the nation and his religion together, and in the year 1596 was initiated among the Jesuits, being then between thirty and forty years of age; though one of his own order says he was but twenty-five, which certainly is erroneous. Having spent some time among the Jesuits in Flanders, he travelled into Italy, and completed his studies at Padua; from whence he passed into Spain, being appointed to govern the Irish seminary at Salamanca. He is said to have had a most ardent zeal for the gaining of souls, and was much esteemed among the people of his persuasion for his extraordinary virtues and good qualities, though he was of a temper not very sociable. At length, taking a journey to Madrid to transact some business of his order, he died there June 17, 1614.

BATHURST (Ralph), M.D. an eminent physician, poet, and divine, born in the year 1620. He studied divinity in Trinity College, Oxford; but the times of confusion coming on, he changed the course of his studies, and applied himself to physic. He took a doctor's degree in that faculty; in which he rose to such eminence, that he was, in the time of the usurpation, appointed physician to the state. Upon the restoration, he quitted his profession of physic; was elected a fellow of the Royal Society, and president of his college; and having entered into holy orders, he was made chaplain to the king, and afterwards dean of Wells. Soon after, he served the office of vice-chancellor of Oxford, and was nominated by King William and Queen Mary to the see of Bristol; which he refused to accept. His learning and talents were various. He was an orator, a philosopher, and a poet: he possessed an inexhaustible fund of wit, and was a facetious companion at 80 years of age. Ridicule was the weapon with which he used to correct the delinquents of his college; and he was so absolute a master of it, that he had it always at hand. His poetical pieces in the *Musa Anglicana* are excellent in their kind. He wrote several poems, both in English and Latin; and died June 14, 1704, in the 84th year of his age.

BATSFORD, a village of Gloucestershire, through which

passes the great Roman road from the north in its way to Cirencester, and there is a small entrenchment almost entire, supposed to have been thrown up by the Romans. It is four miles from Campden.

BATECOLA, a fortified town on the east coast of Ceylon, subject to the Dutch. Long. 81. 3. E. Lat. 5. 55. N.

BATTIE (Dr. William), an English physician, was born in Devonshire, 1704. He received his education at Eton; and, in 1722, was sent to King's College, Cambridge. His own inclination prompted him to the profession of the law; but his finances would not support him at one of the inns of court. He had two cousins of the name of Coleman, old bachelors and wealthy citizens, to whom, upon this occasion, he applied for assistance; but they declined interfering in his concerns. Upon this he turned to physic, and first entered upon the practice of it at Cambridge; where, in 1729, he gave a specimen of an edition of *Hiocrates*, which he afterwards, 1749, completed in two vols. 8vo.

He afterwards removed to Uxbridge, and then to London; where, meeting with success and flourishing, his relations the Colemans, who had now left off business and retired, grew fond, or rather proud of him, and behaved to him with cordiality and friendship. In 1738, or 1739, he fulfilled by marriage a long engagement to a daughter of Barnham Goode, the under-master of Eton school, who is honoured with a place in the Dunciad, for having abused Pope in a piece called *The Mock Æsop*. Against Goode, it seems, the Colemans had a political antipathy: however, they behaved well to Mrs. Battie, and the survivor of them left the doctor 30,000*l*. In the dispute which the college of physicians had with Dr. Schomberg, about 1750, Dr. Battie, who was at that time one of the censors, took a very active part against that gentleman. In 1751, he published *De Principiis Animalibus Exercitationes* in Coll. Reg. Medicorum, in three parts; which were followed, the year after, by a fourth. In 1757, being then physician to St. Luke's Hospital, and master of a private mad-house near Wood's-clofe in the road to Illington, he published, in 4to. *A Treatise on Madnets*; in which, having thrown out some censures on the medical practice formerly used in Bethlem Hospital, he was replied to, and severely animadverted on, by Dr. John Monro, whose father had been lightly spoken of in the fore-mentioned treatise. In 1762 he published *Aphorismi de cognoscendis et curandis morbis nonnullis ad principia accommodati*. February 1763 he was examined before a committee of the House of Commons, on the state of the private mad-houses in this kingdom; and received in their printed report a testimony very honourable to his abilities.

In 1776 Dr. Battie was seized with a paralytic stroke, of which he died, June the 13th, in his seventy-fifth year.

BATTING MACHINE, a machine for batting or beating and cleaning cotton from the huffs and foulnesses contained in it. In Pl. 16. we have given a view of this curious engine, the invention of Mr. Bowden of Mellor in Derbyshire. Fig. 1. is a perspective view of the whole machine. A A A A, the frame of the machine. B, the flake, made of cords, upon which the cotton is battet, moving perpetually over the rollers c, C, which are moved by a pinion on the end of the axle of the cranks D, which drives a large bevel-wheel, fixed on the bottom of the upright shaft E, upon the top of which is a bevel pinion, which drives a large bevel-wheel upon the end of the axle of the roller C. F F, two boards fixed to the cross-frames, on each side of the flake B, to prevent the cotton from falling off, the which are notched, in order that the batting-sticks may strike the cotton upon the flake B. G, a loose rod, crossing the flake close to the cords under the cotton, which, by the vibration of the cords, loosens the cotton therefrom before it falls over the roller C. Fig. 2. the ground-plan of the

machine, drawn by the scale T. D, an axle, having ten cranks, standing upon ten different squares or sides of ditto; the first and second of which are opposite, as are all the rest, upon different squares, alternately to the end, with a support in the middle, with a brads foot for the axle to move in, to keep the same from vibrating. Fig. 3. a plan of four of the arms, shewing their different movements, drawn by the scale U. H, H, H, H, the arms, fixed to the bottom cross frame by an axle working in iron slides, which are moveable, if necessary, at a a.—I, I, rails, worked by two opposite cranks at c, c, and fixed to the lower ends of the arms by swivel pins at i, i. J, J, iron slides, fixed by screws to the ends of the rails I, I, in order to lengthen or contract them, as may be found necessary. K, K, rails fixed to the upper parts of the arms at b, b, by swivel pins, which work the opposite arms at d, d. L, L, L, L, wood rollers upon the tops of the arms, moving an axle in iron frames, to which axles are fixed the sockets e, e, e, e, which hold the batting sticks fastened therein by hoops and screws. M, M, M, M, leather straps fixed to the rollers L, L, L, L, and to the upper cross frame at k k k k, as in Fig. 1, which straps, when drawn tight by the arms moving forwards towards the flake B, as in fig. 1, strike the blows upon the cotton. N, N, two catches or hooks, which are drawn by the springs l, l, that fall into square holes, made for the purpose into iron hoops, on the ends of the rollers L, L, to prevent the sticks from rising after the blow is struck before the sticks are clearly drawn out of the cotton by the return of the arms. O, O, iron slides, fastened by screws to one side of the ends of the rails K, K, with studs fixed thereto, on which the bottom part of the catches move; which studs, when placed at a proper distance from the swivel pins, draw down the catches gradually as the arms move backwards, and prevent the sticks from rising, which they would naturally do, notwithstanding the catches, owing to the circular motions of the arms. P, a long spring, with a small leather strap fastened to the top part of the roller L, on the top of the arm, which throws back the stick to a bolster put on the upper cross-frame, as at f, in fig. 1. Q, a snick or catch fastened on the end of the upper rail K, which fixes the catch g from the roller when the arm returns to the back cross-frame, as at L, fig. 3. R, R, two sticks, which strike upon the cotton at the same time, as do all the rest in their turns, as the cranks move round. W, a small screw, in the bottom of the hook or catch Q, which binds on the top of the slide O, to be altered as may be necessary, to keep such slide in its proper place. X, X, two screws, moveable in two nuts, fixed in the ends of the cross-frames on each side the flake B, as in fig. 2, by means of which the cords of the flake may be tightened or slackened, as may be necessary. S, a pulley, fixed upon the end of the axle of the cranks at h, in fig. 2, by which the whole of the machine is moved.

The following are observations made by the Patentee.

"Though many attempts," says he, "have been made, no operation has been found out to clear the cotton, to expand its fibres, and bring it into that open and pulpy state essential to good carding, save batting, which is a laborious employment, and having been chiefly confined to females, who are inadequate to the task, the work has been very imperfectly performed; besides the disagreeable necessity of either confining a great number of them in a room for that purpose, or of sending the cotton out to as many different houses—circumstances which have long occasioned the trade to lament the want of some invention to remove them, and which I flatter myself is accomplished by the above-described batting machine.

"In a department, hitherto confessedly the most perplexing of any attending the business of cotton spinning, a very considerable abridgment of labour is effected, inasmuch that, at most, two-thirds of the number of girls will now do the

same quantity of work, and much better, than was done before by the strongest women."

BATTLEFIELD, a large village in Shropshire, five miles N. of Shrewsbury, where a victory was gained by Henry IV. over Henry Percy, furnished Hotspur. It has a large church, and one long broad street paved. Long. 2. 42. W. Lat. 52. 22. N.

BAUCONICA (anc. geog.), a town of the Vangiones in Gallia Belgica; nine miles from Mongontiacum, and eleven from Borbitomagus; and therefore supposed to be *Oopenheim*, a town in the Palatinate of the Rhine, and situated on that river.

BAUDELOT (Charles César), a learned advocate in the parliament of Paris, distinguished himself by his skill in ancient monuments, and was received into the academy of Belles-Lettres in 1705. He wrote a Treatise on the Advantages of Travelling; many Letters and Dissertations on Medals, &c.; and died in 1722, aged seventy-four.

BAUDIER (Michael), a gentleman of Languedoc, lived in the reign of Lewis XIII. and published several books, which procured him the character of a copious and laborious author; among which are, 1. An Inventory of the General History of the Turks. 2. The History of the Seraglio. 3. That of the Religion of the Turks. 4. That of the Court of the King of China. 5. The Life of Cardinal Ximenes, &c.

BAUDOBIRGA (anc. geog.), a town of the Treviri in Germany; now *Boppard*, in the electorate of Triers. See BOPPART.

BAUBRAND (Michael Anthony), a celebrated geographer, born at Paris, July 18, 1633. He travelled into several countries; and then applied himself to the revision of Ferrarius's Geographical Dictionary, which he enlarged by one-half. He wrote, 1. Notes to Papius Maslo's Description of the Rivers of France. 2. A Geographical and Historical Dictionary. 3. Christian Geography, or an Account of the Archbishops and Bishops of the whole World: and made several maps. He died at Paris, May 29th, 1700.

BAUHIN (John), a great botanist, was born about the middle of the 16th century. He took his doctor's degree in physic, in 1602; and afterwards became principal physician to Frederick duke of Wirtemberg. The most considerable of his works is his Universal History of Plants.

BAUHIN (Caspar, or Gaspar), younger brother to the preceding, was born at Basil, 1550; and distinguished himself by his skill in anatomy and botany. In 1580 he was chosen first professor of these sciences at Basil; and in 1614 was made first professor of physic, and first physician of that city, which he held till his death, which happened in 1623, at the age of sixty-three. He wrote, 1. Anatomical Institutions; 2. Prodromus Theatri Botanicæ; and other works.

BAUTRU, a celebrated wit, and one of the first members of the French academy, was born at Paris in 1588, and died there in 1665. He was the delight of all the ministers at court, of all the favourites, and of all the great in general. He was indeed a kind of a fool among them; who, while he played the buffoon, took the usual privilege of saying what he pleased. Many of his bons mots are preserved. Once, when he was in Spain, having been to see the famous library of the Escorial, where he found a very ignorant librarian, the king of Spain asked him what he had remarked? To whom Bautru replied, that "the library was a very fine one; but your majesty," adds he, "should make your librarian treasurer of your finances." "Why so?" "Because," says Bautru, "he never touches what he is entrusted with."

BAXTER (William), nephew and heir to Richard (see *Encyc.*), was an eminent schoolmaster and critic. He was born at Lanugany in Shropshire, in the year 1650; and it is

Fig. 2.

Fig. 3.

remarkable, that at the age of eighteen, when he first went to school, he knew not one letter nor understood one word of any language but Welsh; but he so well improved his time, that he became a person of great and extensive knowledge. His genius led him chiefly to the study of antiquities and philology, in which he composed several books. The first he published was a Grammar, in 1679, entitled *De Analogia seu Arte Latine Lingue Commentariolus*. He also published a new and correct edition of Anacreon, with notes; an edition of Horace; a Dictionary of the British Antiquities, in Latin; and several other books. He was a great master of the ancient British and Irish tongues, was particularly skilled in the Latin and Greek, and in the northern and eastern languages. He died May 31st, 1723, after being above twenty years master of Mercers' School in London.

BAXTER (Andrew), a very ingenious writer of Scotland, was born in 1686, or 1687, at Old Aberdeen, of which city his father was a merchant, and educated in King's College there. His principal employment was that of a private tutor to young gentlemen; and among others of his pupils were Lord Grey, Lord Blantyre, and Mr. Hay of Drummelzier. About 1724 he married the daughter of a clergyman in the shire of Berwick. A few years after he published in 4to. *An Enquiry into the Nature of the Human Soul*, wherein its Immateriality is evinced from the Principles of Reason and Philosophy; without date. In 1741 he went abroad with Mr. Hay, and resided some years at Utrecht; having there also Lord Blantyre under his care. He made excursions from thence into Flanders, France, and Germany; his wife and family residing, in the mean time, chiefly at Berwick-upon-Tweed. He returned to Scotland in 1747, and resided till his death at Whittingham, in the shire of East Lothian. He drew up, for the use of his pupils and his son, a piece, entitled, *Matho; five, Cosmotheoria puerilis, Dialogus*. This was afterwards greatly enlarged, and published in English, in two volumes 8vo. In 1750 was published, *An Appendix to his Enquiry into the Nature of the Human Soul*; wherein he endeavours to remove some difficulties which had been started against his notions of the vis inertiae of matter, by MacLaurin, in his Account of Sir Isaac Newton's Philosophical Discoveries. To this piece Mr. Baxter prefixed a dedication to Mr. John Wilkes, with whom he had commenced an acquaintance abroad. He died this year, April the 23d, after suffering for some months under a complication of disorders. He was a very ingenious and knowing man: the French, German, and Dutch languages were spoken by him with much ease, the Italian tolerably; and he wrote and read them all, together with the Spanish. He was a man also of great integrity, humanity, and candour.

BAYLY (Lewis), author of that most memorable book entitled *The Practice of Piety*, was born at Caermarthen in Wales, educated at Oxford, made minister of Evesham in Worcestershire about 1611, became chaplain to King James, and promoted to the see of Bangor in 1616. His book is dedicated "to the high and mighty prince, Charles Prince of Wales;" and the author tells his highness, that "he had endeavoured to extract out of the chaos of endless controversies the old practice of true piety, which flourished before these controversies were hatched." The design was good; and the reception this book has met with may be known from the number of its editions, that in 8vo. 1734, being the fifty-ninth. This prelate died in 1634.

BAYLY (Thomas), son of the preceding, was educated at Cambridge, and having commenced bachelor of arts, was presented to the subdeanery of Wells by Charles I. in 1638. In 1644 he retired, with other loyalists, to Oxford; and two years after we find him, with the Marquis of Worcester, in Ragland

castle. When this was surrendered to the parliament army, he travelled into France and other countries; but returned the year after the king's death, and published at London, in 8vo. a book, entitled *Certamen Religiosum*; or, a Conference between King Charles I. and Henry late Marquis of Worcester, concerning Religion, in Ragland Castle, Anno 1646. But this conference was believed to have no real foundation; and considered as nothing else than a prologue to the declaring of himself a Papist. The same year, 1649, he published *The Royal Charter granted unto Kings by God himself, &c.* to which he added, *A Treatise*, wherein is proved that Episcopacy is *Jure divino*, 8vo. These writings giving offence, occasioned him to be searched out, and committed to Newgate; whence escaping, he retired into Holland, and became a flaming Roman-catholic. During his confinement in Newgate, he wrote a piece entitled *Herba Parietis*; or, the Wall-Flower, as it grows out of the Stone Chamber belonging to the Metropolitan Prison. Some time after he left Holland, and settled at Douay; where he published another book, entitled, *The End to Controversy between the Roman-catholic and Protestant Religions*. At last this singular person went to Italy, where he lived and died extremely poor.

BAYNES (Sir Thomas), an eminent physician, and professor of music at Gresham College, in London, was born about the year 1622, and educated at Christ's College, in Cambridge, under the tuition of the learned Dr. Henry More, where he took the degree of bachelor of arts about the year 1642. In 1649 he took the degree of master of arts, after which time he applied himself to the study of physic. He went into Italy in company with Mr. Finch (afterwards Sir John), with whom he had contracted the greatest friendship; and at Padua they were both created doctors of physic. Upon the restoration of King Charles II. in 1660, Mr. Baynes and Mr. Finch returned into England, and the same year their grace was passed at Cambridge, for creating them doctors of physic in that university. On the 26th of February following, Mr. Baynes, together with Sir John Finch, was admitted a fellow-extraordinary of the College of Physicians of London. Dr. Petty having resigned his professorship of music in Gresham College, Dr. Baynes was chosen to succeed him, the 8th of March, 1660; and the 26th of June following, he and his friend Sir John Finch were admitted graduates in physic at Cambridge, in pursuance of the grace passed in their favour the year before. The winter following, this inseparable pair of friends designed to have made a second tour into Italy, but did not execute their design. The 20th of March, 1663, they were elected fellows of the Royal Society, upon the first choice made by the council, after the grant of their charter, of which they had been members before; and May 13, 1661, had, with several others, been nominated a committee for a library (at Gresham College), and for examining of the generation of insects. In March, 1664, Dr. Baynes accompanied Sir John Finch to Florence, where that gentleman was appointed his majesty's resident, and returned back with him into England in 1670. Towards the end of the year 1672, Sir John being appointed the king's ambassador to the grand-seignior, Dr. Baynes was ordered to attend him as his physician, and before he left England received from his majesty the honour of knighthood. Nine years after, Sir Thomas still continuing in Turkey, the Gresham committee, taking into consideration his long absence without supplying the duty of his place, thought fit to dismiss him from his professorship, and on the 9th of August, 1681, chose Mr. William Perry in his room. The news of this dismissal could not reach Sir Thomas Baynes; for he died at Constantinople the 5th of the following month.

BEAVER (John), a Benedictine monk in Westminster

abbey, flourished about the beginning of the fourteenth century. He was a man of quick parts, and of great diligence and ingenuity; but he applied himself particularly to the study of the history and antiquities of England, and became a great master of both. Among other things, he wrote, *A Chronicle of the British and English Affairs, from the coming in of Brute to his own time*. He also wrote a book, *De Rebus Canonicis Westmonasteriensibus*;—Of Westminster-abbey, and the several Transactions relating thereto. Leland commends him as a historian of good credit; and he is also cited with respect by J. Stow, in his *Survey of London and Westminster*.

BEAUCHAMP (Richard de), earl of Warwick, and one of the most considerable persons in this kingdom in the fifteenth century, was born January 28; 1381, at the manor-house Salwarpe in the county of Worcester, and had for his god-fathers, King Richard II. and Richard Scroope, then bishop of Coventry and Lichfield, and afterwards archbishop of York. He was made Knight of the Bath at the coronation of King Henry IV. in the year 1399, and in the fourth year of the same reign he had livery of his lands, and was retained to serve the king one whole year, with one hundred men at arms, and three hundred archers. The next year, which was 1402, on the coronation of the queen, he kept, according to the custom of those times, jousts, in which he behaved himself very gallantly. He was called the same year to do the crown more serious service, in that dangerous rebellion raised by Owen Glendower, against whom he behaved bravely, and took his standard in open battle. He was, likewise, in the famous battle at Shrewsbury, against the Percies, where he gained great honour, and was, not long after, made Knight of the Garter. In 1408 he obtained a licence from King Henry IV. to visit the holy sepulchre at Jerusalem, in pursuance of a vow he had made. From Jerusalem he came back to Venice, and was there nobly received. Thence he travelled into Russia, into Lithuania, Poland, Westphalia, and some countries of Germany, shewing great valour in divers tournaments whilst he was in those parts. No sooner was he returned into England, than he was, by indenture, dated 2d October, 12 Henry IV. retained with Henry prince of Wales, afterwards king by the name of Henry V. to serve him as well in times of peace as war, both in this realm, upon, and beyond the seas. At the ceremony of the new king's coronation, he was constituted lord high-steward. In the same year, 1413, we find him one of the king's commissioners into France, to treat of a solid peace between the two kingdoms, to be strengthened and cemented by a marriage between the king his master and the Princess Catherine, daughter to the king of France. In the year 1415 he was declared captain of Calais, an office of great trust and honour in those days, and never conferred but upon a man of known abilities as a soldier, and of a clear unquestionable character in point of fidelity. In May 1417, King Henry sent him to the king of France, attended by a thousand men at arms, to treat of a marriage between him and that king's daughter, the Lady Catherine: but the dauphin knowing that this marriage was intended to defeat his succession, he sent a body of five thousand men, under the command of the earls of Vendome and Lymotin, to obstruct his passage, to whom the earl gave battle, in which both those noblemen were killed, and one of them fell by the earl of Warwick's own hand, and about two thousand of their troops were either slain or taken. He then proceeded on his embassy, in which, notwithstanding the difficulties he had to struggle with, he very happily succeeded, to the king's great satisfaction. In the first of Henry VI. he was by indenture retained to be captain of Calais for two years; which fortress being besieged by Philip duke of Bur-

gundy, now reconciled to the French, this noble earl, assisted by Humphrey duke of Gloucester, and Humphrey earl of Stafford, so gallantly defended it, that, after a long siege and great loss, the Duke of Burgundy was forced to retire from before it. Upon the death of the Duke of Bedford, who was regent of France for King Henry, the Earl of Warwick was constituted lieutenant-general of the realm of France and duchy of Normandy, the highest honour a subject of England could receive. He executed this great and difficult employment with his usual wisdom and diligence, for the four last years of his life, and died in possession thereof in the castle of Rouen, April the 30th, 1439.

BEAUCHAMP (Henry de), son to Richard earl of Warwick, was born at Hanley castle in Worcestershire, on the 22d of March, 1424. Being a young nobleman of great spirit and courage, he offered his service before he was full nineteen for the defence of Normandy, with which the king was so well pleased, that, by his charter, bearing date the second of April, in the twenty-second year of his reign, he created him Premier Earl of England, and for a distinction between him and all other earls, he farther granted him, and the heirs male of his body, leave to wear a gold coronet upon his head, as well in his own presence as elsewhere, in all such assemblies, and upon all feasts in which the like ornaments were worn. Within three days after this he advanced him to the rank of Duke of Warwick, in consideration of the many virtues and great services of his father, granting him place in parliament and at all other meetings, next after the Duke of Norfolk, before the Duke of Buckingham; bestowing likewise a pension of forty pounds per annum, to be paid by the sheriffs of Warwickshire and Leicestershire out of the revenues of those counties, towards the better support of that honour. But this extraordinary mark of the royal favour was not more kindly and gratefully received by the young Duke of Warwick, than it was hatefully and enviously looked upon by the Duke of Buckingham, who thought himself extremely injured thereby. In that reign every thing was apprehended from the feuds and disputes of the nobility; and therefore, to prevent any ill consequences that might arise from the differences between these two noblemen, this point was settled by an act of parliament; which declared, that from the second of December then next ensuing, they should take place of each other by turns, one that year, and the other the next, and so on as long as they should live together; the Duke of Warwick to have the first year's precedence, and he which should survive, to take place of the other's heir male as long as he lived; and from that time the heir male of each was to take place of the other, according as it should happen, that he had livery of his lands before him. Besides these additional titles and marks of honour, the king gave Henry duke of Warwick more substantial proofs of his affection and gratitude, by granting him the reversion after the death of the Duke of Gloucester, of the islands of Guernsey, Jersey, Sark, Erm, and Alderney, for the yearly tribute of a rosette, to be paid at the feast of St. John the Baptist, as also of the manor and hundred of Bristol in Gloucestershire, for the yearly farm of sixty pounds, as also the castles and manors of the king within the forest of Dean, yielding and paying the yearly rent of one hundred pounds. But, as if all these honours and grants had been still insufficient to express the king's affection for this young nobleman, and his remembrance and respect for his father's services, Henry VI. went still farther, even to the utmost verge and extent of his prerogative, by declaring the said Henry duke of Warwick king of the island of Wight, and placing the crown upon his head with his own hands. As this was the highest honour the king could bestow, so it proved the last favour the

duke could receive; since he was taken off in the flower of his age, at the castle of Hanley, where he was born, on the 17th of June, 1445, in the twenty-second year of his age.

BEAUCHAMP (John de), baron of Kidderminster, in the reign of Richard II. and the first baron created by patent in this kingdom. He was the son of Sir Richard Beauchamp of Holt, who was the grandson of William de Beauchamp of Elmley, and brother to William de Beauchamp, the first earl of Warwick of that family. He was born in the year 1320, and by the death of his father inherited the lands of Holt in Worcestershire, & Edward III. He was early in the service of his prince; for 12 Edward III. when he was not more than twenty, he was in the expedition to Flanders, and in 20 Edward III. in France, and acquired reputation in both. In 1353, he was in Gascoigne, in the retinue of Thomas earl of Warwick, and continued there all the next year. In the thirty-third of the same reign he served again in France with much honour. In the forty-second of that king, he went over into that realm on the same account; and in 46 Edward III. he attended the king's son, John duke of Lancaster, in his expedition into Spain. By these long and faithful services to the crown, he so raised his credit at court, that in the sixth of Richard II. being then one of the esquires of the king's chamber, he had a grant of twenty marks per annum, out of the manor of Sutton, in the forest of Macclesfield in Cheshire. But growing more and more into the king's favour, he, in the ninth of the same reign, from the like considerations, and because he had received the honour of knighthood, under the king's banner displayed against Scotland, had an annuity granted him of one hundred marks, out of the king's rents and revenue in North Wales. But soon after he made a surrender of this annuity, and, instead thereof, had a considerable grant made him in Caermarthenhire, and was also appointed chief-justice of North Wales, both for term of his life. He had also a special charter of divers liberties and privileges, as well in vert and venison, as other things, in his lordship of Kidderminster, in the county of Worcester; granted him much about the same time. By these repeated testimonies of royal kindness, Sir John Beauchamp, who was now advanced to be steward of the king's household, and one of his chief favourites, was encouraged to procure new gifts from the crown; and, therefore, in the eleventh year of King Richard, laying hold of the breaking out of a French war, Sir John Beauchamp obtained for himself a grant of all the manors and lands belonging to the priory of Deerhurst in the county of Gloucester, then seized into the king's hands; as all other priories-alien were. By such grants he acquired a good estate; and to add an augmentation of honour to those of fortune, he procured himself to be created Baron Kidderminster by patent, limiting that honour to his heirs male; which became the precedent for future creations. It was thought that the king intended him farther honours, had not a sudden reverse of fortune put a stop to his master's power, and to his prosperity. This happened in the year 1388, when the Duke of Gloucester, and other powerful lords, having first defeated the army raised by the king's favourite, whom he had created Duke of Ireland, marched on to London, and forced him to call a parliament. Amongst other noble persons then called to account for their past behaviour, our Lord Beauchamp was one, who was first removed from his office of treasurer of the king's household, then sent prisoner to Dover-castle, and lastly condemned and executed for high treason upon Tower-hill.

BEAUCHAMP (John de), son to Sir William de Beauchamp, constable of the castle of Gloucester, was, on the death of Richard de Beauchamp, earl of Warwick, constituted one of the guardians of his son Henry. He purchased from Thomas de Botreux the moiety of the manor of Alcester, and obtained

from King Henry VI. a charter for various privileges and immunities to that place, as also the grant of another fair to be held there on the eve of St. Dunstan, and to continue for two days following. He was in so great credit with that monarch, that in the twenty-fifth year of his reign, he was advanced by him to the dignity of Lord Beauchamp of Powyke, and had an annuity of sixty pounds out of the fee-farm of the city of Gloucester. He was also constituted justice of South Wales, with power to execute that office by himself, or his sufficient deputy. About three years after this, by the kindness of the same prince, he was promoted to the office of lord high-treasurer of England, which he did not hold full two years, but retiring to a private life, died at a good old age, in the year 1475.

BEAUCHAMP (William de), Lord Bergavenny, was the younger son of Thomas de Beauchamp, earl of Warwick. He seems to have made his first campaign in 1366, under the famous John of Gaunt, duke of Lancaster, in his expedition into Castile. He served continually after this through that whole reign, sometimes in Spain, sometimes in France, by land sometimes, and sometimes by sea. For these great services and others expected from him, we find that in the first of Richard II. he was appointed governor of the castle and county of Pembroke, and in the fourth of the same king, lord chamberlain, with an annual pension of two hundred pounds for life. The same year he was retained to serve by indenture with two hundred men at arms, and two hundred archers, under Edmund de Langley, earl of Cambridge, in Spain. In the ninth of King Richard, he attended the Duke of Lancaster into Spain, to support his pretensions to the crown of Castile. He was the next year constituted captain of the castles of Pembroke and Kilgaran in Wales, and holding still his command of Calais, was appointed the king's commissioner to treat with the Earl of Flanders. It was at this juncture he distinguished himself in a manner so particular, that it deserves to be for ever remembered. Amongst other base schemes put into the head of King Richard II. by his favourites, one was, to retire, when the Duke of Gloucester and the other lords were near London with an army, to France, and there purchase the assistance of that monarch, by giving up to him most of the fortresses he then held in that realm. If it be some scandal to our country, that it produced men base enough to betray a young and inconsiderate prince into so foul a contrivance; we must allow that it is no less honourable for us, that this gallant Lord Bergavenny had the courage to stand in the gap to secure our possessions from being so shamefully given up, and at the hazard of his life, to serve the king against his will, and merit his confidence by a noble act of disobedience. For when all things were ready at home for carrying this dark design into execution, and the king sent orders to this lord to quit his command, and transmit certain letters to the court of France, he stoutly refused both. He declared with respect to the former, that he was intrusted with this important fortress with the advice and consent of the nobility, and without their consent he would not render up his command. As for the letters (guessing at their tenor), instead of sending them to Paris, he transmitted them to the Duke of Gloucester in England. He went still farther than this: for when John de la Pole, brother to the great favourite Suffolk, came with the king's orders to take from him the command of Calais, he not only refused to yield it into his hands, but seized him and carried him over prisoner to England, which at that time incensed the king to such a degree, as it entirely ruined the scheme of his ministers, that he caused the Lord Bergavenny, immediately after his arrival, to be arrested and committed to close custody; but soon after, either through fear or choice, caused him to be set at liberty again. In the first of Henry IV.

we find him constituted justice of South Wales for life, and restored to the government of the town and castle of Pembroke and lordship of Tineby, with the addition of the castle and lordship of Kilgaran, and county of Overlowe also for life, paying into the Exchequer seventy marks per annum. He died about the year 1411.

BEAUFORT (John), eldest son of John of Gaunt, duke of Lancaster, was born in Beaufort-castle in Anjou. In 1394, being then a knight, he accompanied his father into Gascony. He was advanced to the honour of Earl of Somerset, in a parliament held at Westminster, by creation, bearing date 1396-7; and on September 29th, in a parliament held at the same place, was created marquis of Dorset; but this last honour being vacated, he was created the same day, September 29th, Marquis of Somerset; notwithstanding which, he was summoned to parliament by the title only of Marquis of Dorset; and by that denomination was made constable of Wallingford-castle, and steward of the honour of Wallingford, November 22, 1397; as also constable of Dover-castle, and warden of the Cinque-ports, on the 6th of February following; and not long after, King Richard the Second's lieutenant in Aquitaine. He was likewise, on the 2d of February the same year, constituted admiral of all the king's fleet, both to the north and west. In 1397 he was one of those lords who, at the great council at Nottingham, impeached Thomas duke of Gloucester, &c. of treason; for which he and the rest of them were adjudged, in the first parliament of King Henry IV. to lose their titles, and the estates that had been given them, at or since the last parliament, belonging to any of those persons they had impeached, or such as they enjoyed at the time of the Duke of Gloucester's imprisonment. By this means, John Beaufort lost the title of Marquis of Dorset, and retained only that of Earl of Somerset; but soon ingratiating himself with the new king, who was his brother by the father's side, he was constituted by him chamberlain of England for life, February 9, 1399-1400. In 1401 he was retained by indenture to serve the king as governor of the town of Caermardyn, and had his estate restored to him. He was also made captain of Calais, with his marches. In 1401, or 1402, he was commissioned with others, to treat of a league of amity between the king of England and the Duke of Gueldres. In 1402 the commons in parliament petitioned for his restitution to the dignity of marquis; which he seemed unwilling to refuse, because that title was new in this kingdom, he being the second on whom it was conferred; however, he accepted of it at last. In the year 1404 he had an assignation of the Isle of Thanet, for the support of himself, and the garrison of Calais, which consisted of his soldiers; and was appointed ambassador to treat of a peace with the French. He also was one of the commissioners empowered to receive such sums of money as then remained unpaid for the ransom of John king of France, taken prisoner at the battle of Crécy. And finally, in the eighth year of King Henry IV. was constituted admiral of the king's whole fleet, as well for the north as west. Having thus passed through many honourable employments, he departed this life on the 21st of April, 1410.

BEAUFORT (Henry), bishop of Winchester, and cardinal priest of the Roman church, was the son of John of Gaunt, duke of Lancaster, by his third wife, Catherine Swinford. He studied for some years at Oxford, but had his education chiefly at Aix la Chapelle, where he applied himself to the civil and common law. Being of royal extraction, he was advanced very young to the prelacy, and was elected bishop of Lincoln in 1397, in the room of John Buckingham, who resigned. In 1399 he was chancellor of the university of Oxford, and at the same time dean of Wells. He was lord high-chancellor of England in 1404, the fifth of his brother Henry IV. The

next year he succeeded William of Wickham, by papal provision, in the see of Winchester, and received the spiritualities from the Archbishop of Canterbury, in the Bishop of London's palace, the 18th of March. He was again lord chancellor in 1414, the second of his nephew Henry V. This prelate was one of King Henry the Sixth's guardians during his minority; and in 1424, the third of the young king's reign, he was a fourth time lord chancellor of England. There were perpetual jealousies and quarrels between the Bishop of Winchester and the protector, Humphrey duke of Gloucester, which ended in the ruin and death of the latter. About two years after, the Bishop of Winchester received with great solemnity, in the church of Our Lady at Calais, a cardinal's hat, with the title of St. Eusebius, sent him by Pope Martin V. In September 1428 the new cardinal returned into England, with the character of the Pope's Legate lately conferred on him; and in his way to London, he was met by the lord mayor, aldermen, and the principal citizens on horseback, who conducted him with great honour to his lodgings in Southwark. He died June 11, 1447.

BEAUFORT (Joan), queen of Scotland, was the eldest daughter of John Beaufort, earl of Somerset, son of John of Gaunt, by Margaret, daughter of Thomas Holland, earl of Kent, and niece to the famous Henry Beaufort, cardinal of St. Eusebius, and Bishop of Winchester. In February 1423 she was married, with great solemnity, in the church of St. Mary Overrey in Southwark, to James the First, king of Scotland, who had been prisoner in England ever since the 30th of March, 1404. Her portion was forty thousand marks. This match was procured by her uncle, the Bishop of Winchester above mentioned, in order to strengthen and support his family by an alliance with the kingdom of Scotland. She set out, with the king her husband, for Scotland, in March 1423, being attended as far as Berwick by her father, and her uncle the cardinal; and on the 20th of that month arrived at Edinburgh. She was crowned with him the 22d of May, 1424. Through her merciful intercession with the king in 1427, he saved the life of Alexander lord of the Isles, who had committed some acts of hostility; and in 1431 that of Archibald earl of Douglas, who was suspected of treason. The 16th of October, 1430, she was delivered at Stirling of two sons at one birth, which were baptized by the names of Alexander and James. Alexander died young, but James lived to succeed his father. In the year 1437 he received an information of a conspiracy forming against the king, her husband's life; upon which he went post to him to Roxburgh, and informed him thereof; but notwithstanding her precaution, the king was most cruelly murdered in the Dominicans abbey at Perth, by the faction of Walter earl of Athol, his uncle, on the 21st of February, 1436-7, in the thirteenth year of his reign. When the ruins entered the room, the queen, to her everlasting honour, so long shrouded the king from the assassins with her own body, that she received two wounds before she could be drawn off him. She married to her second husband, James Stewart, called the Black Knight, son to the lord of Lorne; and dying in the year 1446, was buried at Perth, near the king her first husband.

BEERYCIA (anc. geog.), an ancient name of Bithynia, so called from the Bebrices its inhabitants. The Bebrices were afterwards driven out by the Thracians, viz. the Bithyni and Thyni; from whom, in process of time, the country took the name of *Bithynia*. See *BITHYNIA*.

BEDDINGTON, a village near Croydon in Surrey. Here is Beddington Park, the ancient seat of the Carews, one of the many said to have been the residence of Queen Elizabeth. In the park, which is famous for walnuts, is an avenue of trees, called Queen Elizabeth's Walk. The church

is a Gothic pile, with stalls in the aisles, after the manner of cathedrals.

BEDEN, or **BEDING**, a village in Suffex, thirteen miles from Lewes, near a river of its own name, which runs into the English Channel at New Shoreham, and produces very good mullets, pilks, eels, &c.

BEDERICK (Henry), a celebrated preacher in the fourteenth century, was a monk of the order of St. Angustin at Clare; and furnished by Bury, because he was born at St. Edmund's Bury in Suffolk. Having from his youth shewn a quick wit, and a great inclination to learning, his superiors took care to improve these excellent faculties, by sending him not only to our English, but also to foreign universities: where closely applying himself to his studies, and being a constant disputant, he arrived to such fame, that at Paris he became a doctor of the Sorbonne. Not long after he returned to England, where he was much followed, and extremely admired for his eloquent way of preaching. This eminent qualification, joined to his remarkable integrity, uprightness, decent behaviour, prudence, and dexterity in the management of affairs, so recommended him to the esteem of the world, that he was chosen provincial of his order throughout England; in which station he behaved in a very commendable manner. He flourished about the year 1380, in the reign of King Richard II. He wrote several things, namely, 1. Lectures upon the Master of the Sentences, i. e. Peter Lombard, in four books. 2. Theological Questions, in one book. 3. Sermons upon the Blessed Virgin. 4. A Course of Sermons for the whole year.

BEDFORD (Hilkiah), of Sibsey in Lincolnshire, a quaker, came to London, and settled there as a stationer, between the years 1600 and 1625. He married a daughter of Mr. William Plat of Highgate, by whom he had a son Hilkiah, a mathematical instrument-maker in Hoher-lane, near West Smithfield. In this house (which was afterwards burnt in the great fire of London 1666) was born the famous Hilkiah, July 23, 1663; who in 1679 was admitted of St. John's College, Cambridge, the first scholar on the foundation of his maternal grandfather William Plat. Hilkiah was afterwards elected fellow of his college, and patronized by Heneage Finch earl of Winchelsea, but deprived of his preferment (which was in Lincolnshire) for refusing to take the oaths at the revolution, and afterwards kept a boarding-house for the Westminster scholars. In 1714, being tried in the court of King's Bench, he was fined 1000 marks, and imprisoned three years for writing, printing, and publishing, *The Hereditary Right of the Crown of England asserted*, 1713, folio; the real author of which was George Harbin, a nonjuring clergyman, whom his friendship thus increased, and on account of his sufferings he received 100l. from the late Lord Weymouth, who knew not the real author. His other publications were, a translation of *An Answer to Fontenelle's History of Oracles*, and a Latin Life of Dr. Barwick, which he afterwards translated into English. He died November 26, 1724.

BEDFORD (Thomas), second son of Hilkiah, was educated at Westminster school; and was afterwards admitted of St. John's College, Cambridge; became master's sizar to Dr. Robert Jenkin, the master; and was matriculated December 9, 1730. Being a nonjuror, he never took a degree; but going into orders in that party, officiated amongst the people of that mode of thinking in Derbyshire, fixing his residence at Compton near Ashbourne, where he became much acquainted with Ellis Farnsworth, and was indeed a good scholar. Having some original fortune, and withal being a very frugal man, and making also the most of his money for a length of years, Mr. Bedford died rich at Compton, in February 1773, where he was well respected. As soon as he took orders, he went

chaplain into the family of Sir John Cotton, bart. then at Angiers in France. From thence, having a sister married to George Smith, esq. near Durham (who published his father Dr. John Smith's fine edition of Bede), Mr. Bedford went into the North, and there prepared his edition of Symeonis monachi Dunhelmensis libellus de exordio atque procurfu Dunhelmensis ecclesie; with a continuation to 1154, and an account of the hard usage Bishop William received from Rufus; which was printed by subscription in 1732, 8vo. from a very valuable and beautiful MS. in the cathedral library, which he supposes to be either the original, or copied in the author's life-time. He was living at Ashbourne, 1742, and about that time published an Historical Catechism, containing, in brief, the sacred history and doctrines of christianity, and an explanation of the feasts and fasts of the church, the second edition, corrected and enlarged.

BEDNORE, or **BEDDANORE**, a town in the peninsula of Hindootan, and in the dominions of Tippoo Sultan, regent of Myfore. It was taken by General Mathews in January 1783; but it was surrendered to Tippoo in May following. The capitulation was perfunctorily violated, and the general, it is supposed, was poisoned. Bednore is 42 miles S.E. of Bombay, and 187 N.W. of Seringapatam. Long. 75. 30. E. Lat. 14. 0. N.

BEDRIACUM (anc. geog.), a village of Italy, situated, according to Tacitus, between Verona and Cremona, but nearer the latter than the former. From the account given by that historian, Cluverius conjectures that the ancient Bedriacum stood in the place where the city of Caneto now stands. This village was remarkable for the defeat of the emperor Galba by Otho, and afterwards of Otho by Vitellius.

BEDSTEAD, a frame for supporting a bed. Among the various materials used for bedsteads, iron is not only the most durable, but also the most beneficial, with respect to health. Oak is excellent for this purpose, being almost impervious to worms; if felled in the proper season, and allowed to become dry; but cedar, were it not for its strong odour, would be still more efficacious in preventing the inroads of bugs, or other vermin. Hence, the beams and posts of a bedstead, made of any hard wood, might be inlaid with cedar.

On this occasion, we cannot, in justice to Mr. Lambert, of Berwick-street, Soho, omit to give a concise description of his newly-invented *bedstead for the sick and wounded*, which he terms the *Royal Patent Fracture Bed*, and which is ably calculated to alleviate the painful situation of the aged, the infirm, or diseased. This ingenious contrivance, therefore, affords a comfortable accommodation to persons confined by fractures, gout, palsy, &c.: it is particularly adapted to lying in women. The bed may be made, and the linen changed, without in the slightest manner disturbing the patient, which renders it highly serviceable in camps and hospitals.

We have given a plate of this useful invention, of which the following is an explanation: *A*, Pl. 17. the bedstead; *B*, the feather-bed; *C*, the straining-frame; *D*, the fracture-frame; *S, S, S, S*, four rings in the fracture-frame; *E*, the sleeping-desk; *R, R*, two rings in the sleeping desk; *F, F, F, F*, pulleys put in motion by the machinery; *G, G, G, G*, receiving-hooks of the fracture-frame; 3333, four rings in the straining-frame; *H, H, H, H*, receiving-hooks to ditto; *I*, the plate of the machinery; *K*, the great wheel; *L*, a pinion, with a winch turning the great wheel; *O*, a pall or stop; *M*, a pinion with a fly, to prevent a too sudden descent; *N*, the rollers.

The subjoined directions should be attended to in making and using the bed. Lay the straining-frame *C*, covered with ticking, on the feather-bed *B*, then the under-blanket and sheet: above these, place the fracture-frame *D* (on which

the patient is supported); then the bolster, pillows, and upper clothes, in the usual manner. When the feather-bed is to be made, wind up the two frames, *C* and *D*, by the winch, till the patient is supported above the bed, which may then be made, or, if necessary, another placed in its stead, and the two frames let down upon it.

In changing the linen, the two frames *C* and *D* must be wound up till they reach the four hooks *G, G, G, G*; secure the hooks in the four rings *S, S, S, S*, and wrap the sheet you intend to remove round the upper clothes, to exclude cold; let down the under-frame *C*; replace the blanket, and put on the clean sheet; draw away the other, and again wind up the frame to the fracture-frame, and unhook it at the four corners. Thus resting on the under frame, the patient safely descends to the comforts of a new-made bed and clean linen.

As in the early stages of consumptive, or asthmatic disorders, it is material to avoid the heat of a feather-bed, particularly if the patient be liable to night-sweats, and if he be able to rise and have the linen changed, the fracture-frame may not be necessary: in this case, the lower frame may be wound a little above the feather-bed; at the top of the frame *C*, there is a sleeping-desk, *E*, by which the head and shoulders may be raised at pleasure, by fixing the two hooks at the end of the frame to the two rings *R, R*, and freeing those at the feet: after which, by the use of the winch, it may be lowered or raised at pleasure.

The whole apparatus may be attached to any four-post bedstead by a common carpenter.

It is needless to expatiate upon the utility of such a bedstead to families at a distance from the metropolis: and as we have no personal acquaintance with this ingenious artisan, we cannot be suspected of partiality: indeed, the first account of his invention, together with a plate, was communicated to us by means of a foreign journal lately imported.

It deserves to be noticed, that the prevailing custom of providing the bedsteads of children with curtains is liable to strong and serious objections: 1. Because they prevent a free access of air for the renewal of that miasm which has been rendered unfit for respiration; 2. They endanger the lives of infants by candle-light, from which fatal accidents have frequently happened; and, 3. They are pernicious receptacles for the finest particles of dust, which, as we have already observed, are apt to be inhaled by the person confined within such curtains on the least motion of the bedstead: and thence, perhaps, many young and blooming innocents may date the first period of their consumptive attack. We do not, however, mean to insinuate, that curtains ought to be universally abandoned, as there may occur a variety of instances in which the laws of propriety and decorum might render them useful and necessary.

BEEMAH, a river of Hindoostan, in the Decan. It is a principal branch of the Kistna, coming from the N.W. and joining it near Edghir. It rises in the mountains to the N. of Poonth, and passes within 30 miles of the E. side of that city.

BEGIA, or BGGIA, a town of Africa, in the kingdom of Tunis, with a strong castle, on the declivity of a mountain, 65 miles W. of Tunis. Long. 11. 30. E. Lat. 36. 42. N.

BEK (David), a famous Dutch portrait painter, and disciple of Vandyck; whose skill in his profession, and politeness of address, acquired him high esteem in most courts of Europe. He was in great favour with Charles I. king of England, and taught the principles of drawing to his sons Charles and James. He went afterwards into the service of the kings of France, Denmark, and of Christina queen of Sweden, who made him first gentleman of her bedchamber. His manner

of painting was so quick, that our king Charles told him he believed he could paint if he was riding post. It is said, that in travelling through Germany he fell sick at an inn, and was laid out for dead. His servants drinking for consolation by his bed-side, one of them in a drunken freak said, "Our master was fond of a glass while he was alive, and out of gratitude let us give him a glass now when he is dead." The proposal proving agreeable, he raised up his master's head, and endeavouring to pour some wine into his mouth, Bek opened his eyes; and being compelled, nevertheless, to drink the glass full, gradually revived. He lived some years after, though he died at 35 years old, in 1656.

BEKINSAU (John), author of a book entitled *De Supremo et Absoluto Regis Imperio*, was born at Broadchalke in Wiltshire. He had his education in grammar learning at Wykeham's school, near Winchester, from whence he was sent very early to New College in Oxford; where, having served two years of probation, he was admitted perpetual fellow in the year 1520. In 1526 he took the degree of master of arts. In his college he distinguished himself by his extraordinary skill in the Greek language. In 1538 he resigned his fellowship, and married. What preferment or employment he had afterwards is uncertain. He was familiarly acquainted with, and highly esteemed by, the most learned men of the nation, particularly the famous antiquary and historian John Leland. He was in good esteem with King Henry VIII. and King Edward VI. When Queen Mary came to the crown, and endeavoured to destroy all that her father and brother had done towards the reformation of the church, Bekinsau wheeled about with the times, and became a zealous Roman-catholic. After Queen Elizabeth's accession, when Protestantism again took place, he retired to an obscure village in Hampshire, called Shourborne, where he spent the remainder of his life in great discontent, and was buried in the church of that place, the 20th of December, 1559, aged about sixty-three years.

BELAY (*Engel.*). For the word "bevel" in that article, read "kevel."

BELCHIER (John), was born in the year 1706, at Kington in Surrey. He received his education at Eaton; and, discovering an inclination for surgery, was bound apprentice to Mr. Chelfeld, by far the most eminent man of his profession. Under this great master he soon became an accurate anatomist. His preparations were next esteemed to Dr. Nicholls's, and allowed to exceed all others of that time.

Thus qualified, his practice soon became extensive; and, in the year 1736 he succeeded his fellow-apprentice, Mr. Craddock, as surgeon to Guy's hospital. In this situation, which afforded such ample opportunity of displaying his abilities, he, by his remarkably tender and kind attention to his poorer patients, became as eminent for his humanity as his superior skill in his profession. Like his master Chelfeld, he was very reluctant before an operation, yet quite as successful as that great operator. He was particularly expert in the reduction of the humerus, which, though a very simple operation, is frequently productive of great trouble to the surgeon, as well as excruciating pain to the patient.

He was elected fellow of the Royal Society, to which learned body he communicated several curious cases that fell within his cognizance; particularly a remarkable case of an hydrops ovarii, published in the *Philosophical Transactions*, No. 423; an account of a miller whose arm was torn off by a mill, August 15, 1737, No. 449; and a remarkable instance of the bones of animals being turned red by aliment only, 442. The greatest discoveries frequently are owing to trifling and accidental causes. Such was the case in the last-mentioned circumstance, Mr. Belchier being led to make his

Bedstead for the Wounded.

Dibble

enquiries on that subject by the bone of a boiled leg of pork being discovered to be perfectly red, though the meat was well-flavoured, and of the usual colour.

On his resignation as surgeon of Guy's, he was made governor both of that and St. Thomas's hospital, to which he was particularly serviceable, having recommended not less than 140 governors.

Mr. Belchier, in private life, was a man of strict integrity, warm and zealous in his attachments, sparing neither labour nor time to serve those for whom he professed a friendship. He was a great admirer of the fine arts, and lived in habits of intimacy with the principal artists of his time. He enjoyed a great share of health, though far advanced in years when he died. His body was interred in the chapel at Guy's hospital.

BELERIUM (anc. geog.), a promontory of the Dumnonii, or Damnonii, the westernmost Britons. Now called the *Land's End*, in Cornwall.

BELESTAT, a town of France, in the department of Arriege and late county of Foix, remarkable for a spring, which, it is said, ebbs and flows 12 times in 24 hours, as exactly as a clock.

BELGRADE, a small town of Romania, in European Turkey, on the front of Constantinople, 20 miles N. of that city. Long. 29. o. E. Lat. 41. 22. N.

BELGRAVE (Richard), a writer of the 14th century, of the ancient family of the Belgraves in Leicesterhire, was born at the town of Belgrave, about a mile from Leicester, and educated in the university of Cambridge, where he applied himself with great diligence, and like success, to his studies, and afterwards took the degree of doctor of divinity. He entered himself into the order of Carmelite friars, and distinguished himself by his great skill in the Aristotelian philosophy, and school divinity. However, he was more remarkable for the strength and subtilty of his lectures, than the elegance of his style, the study of polite literature being generally neglected in that age. Pits gives him the character of a man of eminent integrity and piety. He flourished in the year 1320, under the reign of King Edward II. and wrote, among other works, Theological Determinations, in one book; the subject of which was, Whether the Divine Essence could be seen? and Ordinary Questions, in one book.

BELING (Richard), was born in the year 1613, at Belingstown, in the barony of Balrothery, and county of Dublin, the ancient seat of his family, which was of considerable rank in the English pale. He was the son of Sir Henry Beling, knight, and was educated in his younger years at a grammar school in the city of Dublin, but afterwards put under the tuition of some priests of his own religion, which was Popish; who so well cultivated his good genius, that they taught him to write in a fluent and elegant Latin style, as appears by several of his pieces hereafter mentioned. Thus grounded in the polite parts of literature, his father removed him to Lincoln's Inn, to study the municipal laws of his country, where he abode some years, and returned home a very accomplished gentleman; but it does not appear that he ever made the law a profession. His natural inclination turning to arms, he early engaged in the rebellion of 1641, and, though not above twenty-eight years of age, was then an officer of considerable rank: for in February that year he appeared at the head of a strong body of the Irish before Lismore, and summoned the castle to surrender; but the lord Broghill, who commanded in it a small body of one hundred near-raised forces, slighted the summons, and another party coming to his aid, Mr. Beling thought fit to draw off, and quitted the siege. He afterwards became a leading member in the supreme council of

the confederate Roman-catholics at Kilkenny, to which he was principal secretary; by whom he was sent ambassador to the pope, and other Italian princes, in 1645, to crave aid for the support of their cause. He brought back with him a fatal present in the person of the nuncio, John Baptist Rinuccini, archbishop and prince of Fermo, who was the occasion of reviving the distinctions between the old Irish of blood, and the old English of Irish birth, which split that party into factions, prevented all peace with the marquis of Ormond, and ruined the country which he was sent to save. When Mr. Beling had fathomed the mischievous schemes of the nuncio and his faction, and perceived that they had other views than merely to obtain a toleration for the free exercise of their religion, as in the beginning they pretended, nobody was more zealous than he in opposing and agitating their measures, or in promoting the peace then in negotiation, and submitting to the king's authority, which he did with such heartiness and sincerity, that he became very acceptable to the marquis of Ormond, who entrusted him with many negotiations, both before and after the Restoration, which he executed with great fidelity and sufficiency. When the parliament army had subdued the Irish, Mr. Beling retired to France, where he continued several years, and in that time employed himself in writing several books in Latin, in opposition to such writers of the Romish party as had endeavoured to clear themselves from being the instruments of the rebellion, and to lay the blame thereof on the severity of the English government. His account of the transactions of Ireland, during the period of the rebellion, is esteemed by judicious men as being more worthy of credit than any written by the Romish party; and yet he is not free from a partiality to the cause he was at first embarked in, and his credulity has been taxed in the case of Father Finachty. He returned home upon the Restoration, and was repossessed of his estate, by the favour and interest of the duke of Ormond. He died in Dublin, in September 1675, and was buried in the churchyard of Malahide, about five miles from that city.

BELL (Beaupré), son of Beaupré Bell, esq. of Beaupré-hall, in Upwell and Outwell, in Chaceclose hundred, Norfolk, where the Beaupré family had settled early in the fourteenth century, and enjoyed the estate by the name of Beaupré (or de Bello prato) till Sir Robert Bell intermarried with them about the middle of the sixteenth. Sir Robert was speaker of the House of Commons 14 Eliz. and chief baron of the Exchequer, and caught his death at the black assize at Oxford, 1577. Beaupré Bell, his fourth lineal descendant, married Margaret, daughter of Sir Anthony Oldfield, of Spalding, bart. who died 1720, and by whom he had issue his namesake, the subject of this article, and two daughters, of whom the youngest married William Graves, esq. of Fulborn in Cambridgeshire, who thereby inherited the family estate near Spalding, with the site of the abbey, and has a striking likeness of his brother-in-law. Mr. Bell, junior, was educated at Westminster school, admitted of Trinity College, Cambridge, 1723, and soon commenced a genuine and able antiquary. He made considerable collections of church notes in his own and the neighbouring counties, all which he bequeathed to the college where he received his education. Mr. Bloomfield acknowledges his obligations to him for collecting many evidences, seals, and drawings, of great use to him in his History of Norfolk. The old gentleman led a miserable life, hardly allowed his son necessities, and delapidated his house. He had five hundred horses of his own breeding, many above thirty years old unbroken. He took home his son from college, where his library was left to mould. On his death, his son succeeded to his estate, of about 1500l. a-year, which he enjoyed not long, and dying of a consumption unmarried, on the road

to Bath, left the reversion, after the death of his sister (who was then unmarried, and not likely to have issue), with his books and medals, to Trinity College, under the direction of the late vice-master, Dr. Walker. But his sister marrying (as above), it is said the entail was cut off. He was buried in the family burying-place, in St. Mary's chapel, in Outwell church, for the paying of which, and for a monument, he left 150*l*. The registers of the society abound with proofs of Mr. Bell's taste and knowledge in ancient coins, both Greek and Roman, besides many other interesting discoveries.

BELLENDE, or **BALLANTINE** (William), a celebrated author, was, in 1602, professor of humanity, or belles lettres, at Edinburgh, and master of the requests to James I. who had so high an esteem for him, that he enabled him to live in easy circumstances at Paris, where he wrote these three books; the first entitled, *De Statu prisci Orbis in Religione, Re politica, et Literis*; or, the State of Religion, Politics, and Literature, in the old World, both before and after the Flood. The second and third contain the opinions of Cicero on matters of the highest importance, delivered in his own words. They were dedicated to Charles prince of Scotland and Wales, afterwards King Charles I. and to his brother Henry. In a late edition, the Rev. Dr. Parr thought proper to inscribe them to Mr. Burke, Lord North, and Mr. Fox, whose respective portraits are prefixed to each dedication, and whose talents and virtues he celebrates and defends in a preface of seventy-six pages, containing a very free and bold discussion of our public men and measures in very classical language, and a strong and satirical representation, under borrowed names of antiquity, of the chiefs of the other party, or the present ministry.

Bellenden wrote another work, published after his death, "*De tribus Luminibus Romanorum*," whom he conceives to be Cicero, Seneca, and the elder Pliny. The editor gives an account of this work, from whence he took the idea of drawing his characters of the three luminaries of Great Britain. He marks the proficiency in Greek and Roman literature which once distinguished the Scotch, before the civil dissensions drove their brightest geniuses abroad, and celebrates the ardour for philosophy and literature so prevalent in North Britain at present. Dr. Middleton has been charged with borrowing not only the matter, but the arrangement, of his "*Life of Cicero*," from Bellenden, without the least acknowledgment, and the editor confesses himself of this opinion.

BELLESME, a town of France, in the department of Orne, and late province of Perche, with an ancient castle, 75 miles S. W. of Paris. Long. o. 42. E. Lat. 48. 23. N.

BELLOVACI (anc. geog.), a people of Gallia Belgica, reckoned the bravest of the Belgæ; now the *Beauvaisis*, in the Isle of France.

BELMEIS, or **BRAUMES** (Richard de), I. bishop of London in the reign of Henry I. was advanced to that see through the interest of Roger Montgomery, earl of Shropshire, and consecrated 26th July, 1108. Immediately after his consecration, he was appointed by the king warden of the marches between England and Wales, and lieutenant of the county of Salop; which offices he held about three years, residing for the most part of the time at Shrewsbury. This prelate expended the whole revenues of his bishopric on the structure of St. Paul's cathedral in London; but despairing ever to finish it, and growing tired of so much labour and expence, he turned the stream of his liberality another way; and, exchanging the manor of Landworth for a place in the diocese of London called St. Oith de Chich, he built there a convent of regular canons. Being seized with a dead palsy, and thereby disqualified for the exercise of his episcopal functions, he in-

tended to have resigned his bishopric, and to have spent the remainder of his life in the monastery of his own foundation: but whilst he delayed his purpose from day to day, he was prevented by death, which took him out of this life January 16, 1127.

BELMEIS, or **BRAUMES** (Richard de), II. bishop of London, in the reign of King Stephen, was nephew of Richard de Belmeis, bishop of London in the preceding reign, by that prelate's brother, Walter de Belmeis. Before he came to age, he was appointed by his uncle archdeacon of Middlesex; but the bishop was prevailed upon by William dean of London, his nephew by his sister Adelina, and by the Prior of Chich, to commit the administration of the archdeaconry, during Richard's minority, to Hugh, one of his chaplains. It was with no small difficulty that Richard afterwards recovered his archdeaconry out of the hands of this faithless guardian. In the beginning of October 1151 he was advanced to the see of London, in the room of Robert de Sigillo, and consecrated at Canterbury by Archbishop Theobald, in the presence of all the bishops of England, excepting Henry of Winchester, who excused his absence, and approved the choice of Richard, in a letter to the archbishop. This prelate died May 4, 1162.

BELUNUM (anc. geog.), a town of Rhetia, above Feltria, in the territory of the Veneti; now *Belluno*, capital of the Belluncine in the territory of Venice.

BELVOIR-CASTLE, in Lincolnshire, four miles from Grantham, the ancient seat of the dukes of Rutland, supposed to have been a Roman station, as many of their antiquities have been dug up here. Its foundation was laid soon after the Norman conquest. It affords a delightful prospect into the counties of Nottingham, Derby, Leicester, Rutland, and Northampton, as well as over the fruitful valley under it.

BELUS (anc. geog.), a small river of Galilee, at the distance of two stadia from Ptolemais, running from the foot of mount Carmel out of the lake Cendevis. Near this place, according to Josephus, was a round hollow or valley, where was a kind of sand fit for making glass; which, though exported in great quantities, was found to be inexhaustible. Strabo says, the whole of the coast from Tyre to Ptolemais has a sand fit for making glass; but that the sand of the rivulet Belus and its neighbourhood is a better sort: and here, according to Pliny, the making of glass was first discovered.

BENBECULA, an island of Scotland, one of the Hebrides, lying between N. and S. Uist. See *BARA*.

BENBOW (John), vice-admiral of the blue squadron, and one of the most eminent English seamen mentioned in our histories, was born about the year 1650, and was descended of a very ancient, worthy, and honourable family in Shropshire. His father dying when he was very young, left his son John no other provision than that of the profession to which he was bred, viz. the sea, a profession to which he had naturally a great propensity, and in which he succeeded so happily, that before he was thirty he became master, and in a good measure owner, of a ship called the *Bembow* frigate, employed in the Mediterranean trade, in which he would probably have acquired a good estate, if an accident that happened to him in the last voyage he made had not given a new turn to his fortunes, and brought him to serve in the British navy, with equal reputation to himself, and good fortune to his country, to which he rendered many, and those very important, services. In the year 1686, Captain Benbow, in his own vessel, was attacked in his passage to Cadiz by a Saltee rover, against whom he defended himself, though very unequal in the number of men, with the utmost bravery, till at last the Moors boarded him, but were quickly beat out of the ship again, with the loss of thirteen men, whose heads Cap-

tain Benbow ordered to be cut off, and thrown into a tub of pork pickle. When he arrived at Cadiz, he went ashore, and ordered a negro servant to follow him, with the Moors' heads in a sack. He had scarcely landed before the officers of the revenue enquired of his servants what he had in his sack? The captain answered, salt provisions for his own use. "That may be," replied the officers, "but we must insist upon seeing them." Captain Benbow alleged, that he was no stranger there, that he did not use to run goods, and pretended to take it ill that he was suspected. The officers told him, that the magistrates were sitting not far off, and that if they were satisfied with his word, his servants might carry the provisions where he pleased, but that otherwise it was not in their power to grant any such dispensation. The captain consented to the proposal, and away they marched to the custom-house, Mr. Benbow in the front, his man in the centre, and the officers in the rear. The magistrates, when he came before them, treated Captain Benbow with great civility, told him they were sorry to make a point of such a trifle, but that since he had refused to shew the contents of his sack to their officers, the nature of their employments obliged them to demand a sight of them; and that as they doubted not they were salt provisions, the shewing them could be of no great consequence one way or the other. "I told you," said the captain, sternly, "they were salt provisions for my own use. Caesar, throw them down upon the table; and, gentlemen, if you like them, they are at your service." The Spaniards were exceedingly struck at the sight of the Moors' heads, and no less astonished at the account of the captain's adventure, who with so small a force had been able to defeat such a number of barbarians. They sent an account of the whole matter to the court of Madrid, and Charles II. then king of Spain, was so much pleased with it, that he would needs fee the English captain, who made a journey to court, where he was received with great testimonies of respect, and not only dismissed with a handsome present, but his Catholic majesty was also pleased to write a letter in his behalf to King James, who, upon the captain's return, gave him a ship, which was his introduction to the royal navy. After the Revolution, he was constantly employed, and frequently, at the request of the merchants, was appointed to cruise in the channel, where he did very great service, as well in protecting our own trade, as in annoying and distressing that of the enemy. He was likewise generally made choice of for bombarding the French ports, in which he shewed the most intrepid courage, by going in person in his boat to encourage and protect the engineers, who, for that reason, were very solicitous that he should command the efforts whenever they went upon those hazardous enterprises, in which they knew he would not expose them more than was absolutely necessary, and that he would put them upon running no sort of danger, in which he did not willingly take his share. The vigour and activity of Captain Benbow, in every service on which he was employed, recommended him so effectually to his royal master King William, who was both a good judge of men, and always willing to reward merit, that he was very early promoted to a flag, and intrusted with the care of blockading Dunkirk; the privateers from thence proving extremely detrimental to our trade during all that war. In 1695 we find him thus employed with a few English and Dutch ships, when the famous Du Bart had the good luck to escape him, with nine sail of clean ships, with which he did a great deal of mischief, both to our trade and to that of the Dutch. In 1697, he sailed the 10th of April, from Spithead, with seven third-rates and two fire-ships, and after some time returned to Portsmouth for provisions; after which he had the good fortune to join the Virginia and West-India fleets, and saw them safe into port.

After the concluding of the peace of Ryfwick, and even while the partition treaties were negotiating, King William formed a design of doing something very considerable in the West-Indies, in case his pacific views should be disappointed, or Charles II. of Spain should die suddenly, as was daily expected. There were, indeed, many reasons, which rendered the sending a squadron at that time into those parts highly useful and requisite. Our colonies were in a very weak and defenceless condition, the seas swarmed with pirates, the Soots had established a colony at Darien, which, very unluckily for them, gave the English little satisfaction, at the same time that it provoked the Spaniards very much. King William himself fixed upon Rear-Admiral Benbow to command this squadron, which proved but a very small one, as consisting only of three fourth-rates; and when he went to take upon him his command, he received private instructions from the king to make the best observations he could on the Spanish ports and settlements, but to keep as fair as possible with the governors, and to afford them any assistance he could, if they desired it. He was likewise instructed to watch the galleons; for the king of Spain, Charles II. was then thought to be in a dying condition. Rear-Admiral Benbow sailed in the month of November 1698, and did not arrive in the West-Indies till the February following, where he found things in a very indifferent situation. Most of our colonies were in a bad condition, many of them engaged in warm disputes with their governors, the forces that should have been kept up in them for their defence so reduced by sickness, desertion, and other accidents, that little or nothing was to be expected from them: but the admiral carried with him Colonel Collingwood's regiment, which he disposed of to the best advantage in the Leeward Islands. This part of his charge being executed, he began to think of performing the other part of his commission, and of looking into the state of the Spanish affairs, as it had been recommended to him by the king; and a proper occasion of doing this very speedily offering, he effected it. On his return to Jamaica, towards the latter end of the year, he received a supply of provisions from England, and, soon after, orders to return home, which he did with six men-of-war, taking New England in his way, and arrived safe, bringing with him from the plantations sufficient testimonies of his having discharged his duty, which secured him from all danger of censure, though the House of Commons expressed very high resentment at some circumstance that attended the sending this fleet. But in regard to the admiral, the greatest compliments were paid to his courage, capacity, and integrity, by all parties; and the king, as a signal mark of his kind acceptance of all his services, granted him an augmentation of arms, which consisted in adding to the three Bent Bows, he already bore, as many Arrows; which singular act of royal favour sufficiently destroys the foolish report of his being of mean extraction. His conduct in this expedition raised him so much in the king's esteem, that he consulted him as much or more than any man of his rank, and yet without making the admiral himself vain, or exposing him in any degree to the dislike of the ministers. It may be easily imagined, that, in the time the rear-admiral spent in the West-Indies, the face of affairs was much changed: indeed, so much they were changed, that the king was forced to think of a new war, though he was sensible the nation suffered severely from the old one. His first care therefore was, to put his fleet into the best order possible, and to distribute the commands therein to officers that he could depend upon; and to this it was that Mr. Benbow owed his being promoted to the rank of vice-admiral of the blue. After this, the command of a West-India squadron was conferred on him; and in an engagement with the French, he had the misfortune to lose

his leg. During all the time of his illness he behaved with great calmness and preference of mind, having never flattered himself, from the time his leg was cut off, with any hopes of recovery, but shewed an earnest desire to be as useful as he could while he was yet living. He continued thus discharging his duty till the last moment; for dying of a short consumption, his spirits did not fail him till very near his end, and his senses were very found to the day he expired, which was on the 4th of November, 1702.

BENBOW (John), son to the vice-admiral before mentioned. He was intended by his father for a seaman, and educated accordingly. His misfortunes began very early, viz. in the same year his father died in the West-Indies, by being shipwrecked on the coast of Madagascar, where, after many dismal and dangerous adventures, he was induced to live with, and in the manner of, the natives, for many years, and at last, when he least expected it, he was taken on board by a Dutch captain, out of respect to the memory of his father, and brought safe to England, when his relations thought him long since dead. He was a young gentleman naturally of a very brisk and lively temper; but by a long series of untoward events, came to alter his disposition entirely, to as to appear, after his return, very serious, or rather melancholy, and did not much affect speaking, except among a few intimate friends. But the noise of his remaining so long, and in such a condition, upon the island of Madagascar, induced many to visit him, and to enquire into the circumstances of the life he led there, whom he civilly received, and readily satisfied their curiosity, though otherwise distinguished, as has been said, by his taciturnity; but he always looked upon his preservation there, and his escape from thence, as such signal instances of the favour of Providence, that he did not judge himself at liberty to conceal them. But notwithstanding his freedom in communicating this part of his history, very few particulars relating to it can now be recovered. He lived several years after his return to England, but in a very private manner.

BENDLOWES (Edward), author of some poetical pieces, was son and heir of Andrew Bendlowes, esq. and born in the year 1613. This gentleman was carefully educated in grammar learning, and at sixteen years of age admitted a fellow-commoner of St. John's College, in Cambridge, to which he was afterwards a benefactor. From thence he went with a tutor to travel, and having gone through several countries, and visited seven courts of princes, he returned home a most accomplished gentleman both in behaviour and conversation, but a little tinctured with the principles of Popery. Being very imprudent in the management of his worldly concerns, he made a shift, though he was never married, to squander away his estate (which amounted to seven hundred or a thousand pounds a year) on poets, musicians, buffoons and flatterers, and in buying curiosities. He gave a handsome fortune with a niece named Philippa, who was married to Mr. Blount, of Maple Durham, in Oxfordshire; and having besides engaged himself for the payment of other men's debts, which he was not able to discharge, he was put into prison at Oxford; but being soon after released, he spent the remainder of his life, which was eight years, in that city. He was esteemed in his younger days a great patron of the poets, especially Quarles, Davenant, Payne, Fisher, &c. who either dedicated books to him, or wrote epigrams and poems on him. His flatterers used to style him Benevolus, by way of anagram on his name, in return for his generosity towards them. Towards the latter end of his life, he was drawn off from his inclination to Popery, and would often take occasion to dispute against the Papists and their opinions, and particularly disliked the favourers of Arminius and Socinus. This gentleman, reduced through his own indiscretion to great

want, died at Oxford the 18th of December, 1686, aged seventy-three years.

BENEFIELD (Sebastian), an eminent divine of the 17th century, was born in 1559 at Prestonbury in Gloucestershire, and educated at Corpus Christi College in Oxford. In 1608 he took the degree of doctor in divinity; and five years after, was chosen Margaret professor in that university. He had been presented several years before to the rectory of Meysey-Hampton in Gloucestershire. He published Commentaries upon the first, second, and third chapters of Amos; a considerable number of sermons; and some Latin treatises. He died in 1630.

BENEVENTUM (anc. geog.), a town of the Samnites, formerly called *Maleventum* from the unwholesomeness of the wind, and under that appellation it is mentioned by Livy; but after a Roman colony was led thither in the 485th year of the city, it came to have the name of *Beneventum*, as a more auspicious title. It is mentioned by Horace as an ancient city said to have been built by Diomedes before the Trojan war. Now *Benevento*.

BENGUELA, the capital of the kingdom of the same name, where the Portuguese have a fort. It lies to the north of the bay of Benguela. Long. 12. 30. E. Lat. 10. 30. S.

BENI (Paul), professor of eloquence in the university of Padua. He was a Greek by nation, according to Bayle; but other authors affirm that he was born at Eugubio, in the duchy of Urbino. He was in the society of Jesuits for some time, but quitted them upon their refusing him permission to publish a commentary on the feast of Plato. He was a great critic, and maintained a dispute with the Academy de la Crusca of Florence. He published a treatise against their Italian dictionary, under the title of *Anti-Crusca*, at *Paragone della Lingua Italiana*. He had likewise another contest with the same academy in regard to Tasso, whose defence he undertook, and published two pieces on this subject. In one of these he compares Tasso to Virgil, and Ariosto to Homer, in some particulars giving Tasso the preference to these two ancients; in the other he answers the critical censures which had been made against this author. He published also some discourses upon the Pastor Fido of Guarini. These pieces which we have mentioned were in Italian; but he left a great number of works in Latin. He died the 12th of February, 1625.

BENIGNUS (St.), archbishop of Armagh in Ireland, was the immediate successor of St. Patrick in that see, anno 455. He was the son of Seignen, a man of wealth and power in Meath, who, in the war in 453, hospitably entertained St. Patrick in his journey from the port of Colp, where he landed, to the court of King Leogair at Tara, and with his whole family embraced Christianity, and received baptism. The youth grew so fond of his father's guest, that he could not be separated from his company. St. Patrick took him away with him at his departure, and taught him his first rudiments of learning and religion. Benin profited greatly under such a master, and became afterwards a man eminent for piety and virtue, whom St. Patrick thought worthy to fill the see of Armagh, which he resigned to him in 455. Benin died in 458, on the 9th of November, having also resigned his see three years before his death.

BENNEVIS, a mountain of Scotland, near Fort-William, in the shire of Inverness. It is esteemed the highest in Britain, rising more than 4300 feet above the level of the sea, its pointed summit capped with snow.

BENNINGTON, the principal town of the state of Vermont in New England, in the south-west corner of the state, near the foot of the Green Mountain. Its public buildings are a church, a court-house, and a gaol; but the assembly commonly hold the sessions at Windsor. It has many elegant houses, and is a flourishing town. Near the centre of the

town is Mount Anthony, which rises very high in the form of a sugar-loaf. Bennington is 30 miles east by north of Albany. Long. 73. 10. W. Lat. 43. 0. N.

BENTHAM (Edward), canon of Christ-church, Oxford, and king's professor of divinity in that university, was born in the college at Ely, July 23, 1707. His father, Mr. Samuel Bentham, was a very worthy clergyman, and vicar of Witchesford, a small living near that city; who having a numerous family, his son Edward, on the recommendation of Dr. Smalridge, dean of Christ-church, was sent in 1717 to the school of that college. Having there received the rudiments of classical education, he was in Lent-term, 1723, when nearly sixteen years of age, admitted of the university of Oxford, and placed at Corpus-Christi College, under his relation, Dr. John Burton. In this situation his serious and regular deportment, and his great proficiency in all kinds of academical learning, recommended him to the notice of several eminent men; and, among others, to the favour of Dr. Tanner, canon of Christ-church, by whose death he was disappointed of a nomination to a studentship in that society. At Corpus-Christi College he formed a strict friendship with Robert Hoblyn, esq. of Nanfawden in Cornwall, afterwards representative for the city of Bristol, whose character, as a scholar and a member of parliament, rendered him deservedly esteemed by the lovers of literature and of their country. In company with this gentleman and another intimate friend, Dr. Ratcliff, afterwards master of Pembroke College, Mr. Bentham made, at different times, the tour of part of France, and other places. Having taken the degree of bachelor of arts, he was invited by Dr. Cotes, principal of Magdalen-hall, to be his vice-principal; and was accordingly admitted to that society, March 6, 1729-30. Here he continued only a short time; for, on the 23d of April, in the year following, he was elected fellow of Oriel College. In act term, 1732, he proceeded to the degree of master of arts, and, about the same time, was appointed tutor in the college; in which capacity he discharged his duty in the most laborious and conscientious manner for more than twenty years. March 26, 1743, Mr. Bentham took the degree of bachelor in divinity; and April 22, in the same year, was collated to the prebend of Hunderton, in the cathedral-church of Hereford. July 8, 1749, he proceeded to the degree of doctor in divinity; and in April, 1754, was promoted to the fifth stall in that cathedral. Here he continued the same active and useful course of life for which he had always been distinguished. He served the offices of sub-dean and treasurer, for himself and others, for above twelve years. The affairs of the treasury, which Dr. Bentham found in great confusion, he entirely new-modelled, and put into a train of business in which they have continued ever since, to the great ease of his successors, and benefit of the society. So intent was he upon the regulation and management of the concerns of the college, that he refused several preferments which were offered to him, from a conscientious persuasion, that the avocations they would produce were incompatible with the proper discharge of the offices he had voluntarily undertaken. Being appointed by the king to fill the divinity chair, vacant by the death of Dr. Panhawe, Dr. Bentham was, with much reluctance, and after having repeatedly declined, persuaded by Archbishop Secker and his other learned friends to accept of it; and, on the 9th of May, 1763, he was removed to the eighth stall in the cathedral. His unwillingness to appear in this station was increased by the business he had to transact in his former situation, and which he was afraid would be impeded by the accession of new duties; not to say that a life spent in his laborious and sedentary manner had produced some unfavourable effects on his constitution, and rendered a greater attention than he had hitherto shewn to private ease and health absolutely necessary. Besides, as the duties, when properly discharged, were great and interesting, so the station itself was of that elevated and public na-

ture to which his ambition never inclined him: he preferred a humble situation. The diffidence he had of his abilities had ever taught him to suspect his own sufficiency; and his inaugural lecture breathed the same spirit; the text of which was, "Who is sufficient for these things?" But whatever objections Dr. Bentham might have to the professorship before he entered upon it, when once he had accepted of it, they never discouraged him in the least from exerting his most sincere endeavours to render it both useful and honourable to the university. He set himself immediately to draw out a course of lectures for the benefit of young students in divinity, which he constantly read at his house at Christ-church, gratis, three times a-week during term time, till his decease. The course took up a year; and he not only exhibited in it a complete system of divinity, but recommended proper books, some of which he generously distributed to his auditors. His intense application to the pursuit of the plan he had laid down, together with those concerns in which his affection for his friends, and his zeal for the public good in every shape, involved him, proved more than a counterbalance for all the advantages of health and vigour that a strict and uniform temperance could procure. It is certain that he sunk under the rigorous exercise of that conduct he had proposed to himself: for though sixty-eight years are a considerable proportion in the strongest men's lives, yet his remarkable abstemiousness and self-denial, added to a disposition of body naturally strong, promised in the ordinary course of things a longer period. Dr. Bentham was a very early riser, and had transacted half a day's business before many others began their day. His countenance was uncommonly mild and engaging, being strongly characteristic of the piety and benevolence of his mind; and at the same time it by no means wanted expression, but, upon proper occasions, could assume a very becoming and affecting authority. In his attendance upon the public duties of religion, he was exceedingly strict and constant; not suffering himself ever to be diverted from it by any motives, either of interest or pleasure. Whilst he was thus diligent in the discharge of his own duty, he was not severe upon those who were not equally diligent. He could scarcely ever be prevailed upon to deliver his opinion on subjects that were to the disadvantage of other men; when he could not avoid doing it, his sentiments were expressed with the utmost delicacy and candour. No one was more ready to discover, commend, and reward every meritorious endeavour. Of himself he never was heard to speak; and if his own merits were touched upon in the slightest manner he felt a real uneasiness. Though he was not fond of the formalities of visiting, he entered into the spirit of friendly society intercourse with great pleasure. His constant engagements, indeed, of one kind or other, left him not much time to be devoted to company; and the greater part of his leisure hours he spent in the enjoyment of domestic pleasures, for which his amiable and peaceable disposition seemed most calculated. Till within the last half-year of his life, in which he declined very fast, Dr. Bentham was scarcely ever out of order; and he was never prevented from discharging his duty, excepting by a weakness that occasionally attacked his eyes, and which had been brought on by too free an use of them when he was young. That part of his last illness which confined him, was only from the 23d of July to the 1st of August. Even death itself found him engaged in the same laborious application which he had always directed to the glory of the Supreme Being, and the benefit of mankind; and it was not till he was absolutely forbidden by his physicians, that he gave over a particular course of reading that had been undertaken by him with a view of answering Mr. Gibbon's Roman History. Thus he died at his post, like a faithful soldier, in the exercise of his arms, and the defence of his religion. That serenity of mind and meekness of disposition, which he had manifested on every former occasion, shone forth in a more epi-

cial manner in his latter moments; and, together with the consciousness of a whole life spent in the divine service, exhibited a scene of true Christian triumph. After a few days' illness, in which he suffered a considerable degree of pain without repining, a quiet sigh put a period to his existence below, on the 11th of August, 1776, when he had entered into the sixty-ninth year of his age.

BENTHEIM, a town of Germany, in the circle of Westphalia, capital of a county of the same name, seated on the Vecht, 32 miles north-west of Munster. Long. 7. 25. E. Lat. 52. 23. N.

BENTINCK, or **BENTINCK** (William), earl of Portland, &c. one of the greatest statesmen of his time, and the first that advanced his family to the dignity of the English peerage. M. Bentinck was a native of Holland, being descended of an ancient and noble family of that name in the province of Guelderland. After a liberal education, he was, by the interest of his friends, promoted to be page of honour to William, then Prince of Orange (afterwards King William III. of England), in which station, his good behaviour and address so recommended him to the favour of his master, that he preferred him to the more honourable post of gentleman of his bed-chamber. In this capacity he accompanied the prince into England in the year 1670, where, going to visit the university of Oxford, he was, together with the prince, created doctor of civil-law. In 1672, the Prince of Orange being made captain-general of the Dutch forces, and soon after stadtholder, M. Bentinck was promoted, and had a share in his good fortune, being made colonel and captain of the Dutch regiment of guards, afterwards esteemed one of the finest in King William's service, and which behaved with the greatest gallantry in the wars both in Flanders and Ireland. In 1675, the prince falling ill of the small-pox, M. Bentinck had an opportunity of signaling his love and affection for his master in an extraordinary manner, and thereby of obtaining his esteem and friendship, by one of the most generous actions imaginable: for the small-pox, not rising kindly upon the prince, his physicians judged it necessary that some young person should lie in the same bed with him, imagining that the natural heat of another would drive out the disease, and expel it from the nobler parts. Nobody of quality could be found in all the court to make this experiment: at last, M. Bentinck, though he had never had the small-pox, resolved to run the risk, and accordingly attended the prince during the whole course of his illness, both day and night. Nothing was given him, nor was he ever removed in his bed, by any other hand. In the year 1677, M. Bentinck was sent by the Prince of Orange into England, to solicit a match with the Princess Mary, eldest daughter of James, at that time duke of York (afterwards King James II), which was soon after concluded. And in 1685, upon the Duke of Monmouth's invasion of this kingdom, he was sent over to King James to offer him his master's assistance, both of his troops and person, to head them against the rebels, but, through a misconception put on his message, his highness's offer was rejected by the king. In the year 1688, when the Prince of Orange intended an expedition to England, he sent M. Bentinck, on the Elector of Brandenburg's death, with his compliments to the new elector, and also to lay before him the state of affairs, to communicate to him his design upon England, and to solicit his assistance to put it in execution, &c. In this negotiation M. Bentinck was so successful, that he carried to his master a more favourable and satisfactory answer than the prince had expected; the elector having generously granted even more than was asked. M. Bentinck had also a great share in the glorious revolution on which our present happy establishment is founded; in which difficult and important affair, he shewed all the prudence and sagacity of the most consummate and able statesman. M. Bentinck ac-

companied the prince in his expedition to England; and after King James's abdication, during the interregnum, he held the first place among those who composed the prince's cabinet at that critical time, and that in such a degree of super-eminence, as scarcely left room for a second; and we may be sure that he was not wanting, as far as his services could avail, in endeavouring to procure the crown for the prince his master; who, when he had obtained it, was as forward on his part in rewarding the faithful and signal services of M. Bentinck. Immediately upon the prince's accession to the British crown, M. Bentinck was made groom of the stole, privy purse, first gentleman of the royal bed-chamber, and was the first commoner upon the list of privy-counsellors; and, to fit him for greater honours, was soon after naturalized by act of parliament; and, by letters patent bearing date the 9th of April, 1690, two days before the king and queen's coronation, he was created Baron of Cirencester, Viscount Woodstock, and Earl of Portland. In the year 1690, the Earl of Portland, with many others of the English nobility, attended King William to Holland, where the earl acted as envoy for his majesty, at the grand congress held at the Hague the same year; an assembly the most honourable to the English nation that is any-where to be read of. In the year 1695 King William made this nobleman a grant of the lordships of Denbigh, Bromfield, Yale, and other lands, containing many thousand acres, in the principality of Wales, which being part of the demaine thereof, the grant was opposed, and the House of Commons addressed the king to put a stop to the passing it, which his majesty accordingly complied with, and recalled the grant, promising, however, to find some other way of shewing his favour to Lord Portland, who, he said, had deserved it by long and faithful services; and this promise the king ever after made good. It was to this nobleman, that the horrid plot for assassinating King William, in the year 1695, was first discovered; and his lordship, by his wise counsel and indefatigable zeal, was very instrumental in bringing to light the whole of that execrable scheme. The same year another affair happened, in which this noble lord gave such a shining proof of the strictest honour and integrity, as has done immortal honour to his memory. The parliament having taken into consideration the affairs of the East-India Company, who, through mismanagement and corrupt dealings, were in danger of losing their charter; strong interest was made with the members of both houses, and large sums properly distributed, to procure a new establishment of their company by act of parliament. Among those noblemen whose interest was necessary to bring about this affair, Lord Portland was particularly courted, and an extraordinary value put upon it, much beyond that of any other peer; for he was offered no less than the sum of 50,000 pounds for his vote, and to use his endeavours with the king to favour the design. But his lordship, possessed of a greatness of soul that placed him above corruption, treated this injurious offer with all the contempt and indignation it deserved, telling the person employed in it, that if he ever so much as mentioned such a thing to him again, he would for ever be the company's enemy, and give them all the opposition in his power. This is an instance of public spirit not often met with, and did not pass unregarded; for we find it recorded in an eloquent speech of a worthy member of parliament, who took occasion to relate this noble action to the House of Commons, much to the honour of Lord Portland. It was owing to this nobleman, that the Banqueting-house at Whitehall was saved, when the rest of the palace was destroyed by fire. Going on thus in a course of honour and prosperity, his lordship, in February 1696, was created a knight of the most noble order of the Garter, at a chapter held at Kensington, the sovereign and ten knights being present, and was installed at Windsor on the 25th of March, 1697, at which time he was also lieutenant-general of his majesty's forces; for his lordship's services were

not confined to the cabinet; he likewise distinguished himself in the field on several occasions, particularly at the battle of the Boyne, battle of Landen, where he was wounded, siege of Limerick, Namur, &c. As his lordship thus attended his royal master in his wars both in Ireland and Flanders, and bore a principal command there, so he was honoured by his majesty with the chief management of the famous peace of Ryfwick.

The king had for a long time given the Earl of Portland the entire and absolute government of Scotland; and his lordship was also employed, in the year 1698, in the new negotiation set on foot for the succession of the crown of Spain, called by the name of the Partition Treaty, the intention of which being frustrated by the treachery of the French king, the treaty itself fell under severe censure, and was looked upon as a fatal slip in the politics of that reign; and Lord Portland was impeached by the House of Commons, in the year 1700, for advising and transacting it, as were also the lords concerned with him in it. The Partition Treaty was the last public transaction we find Lord Portland engaged in; the next year, 1701, having put a period to the life of his royal and munificent master King William III. but not without having shewn, even in his last moments, that his esteem and affection for Lord Portland ended but with his life; for when his majesty was just expiring, he asked, though with a faint voice, for the Earl of Portland, but before his lordship could come, the king's voice quite failed him. The earl, however, placing his ear as near his majesty's mouth as could be, his lips were observed to move, but without strength to express his mind to his lordship; but, as the last testimony of the cordial affection he bore him, he took him by the hand, and carried it to his heart with great tenderness, and expired soon after. His lordship had before been a witness to, and signed, his majesty's last will and testament, made at the Hague in 1695; and it is told, that King William, the winter before he died, told Lord Portland, - as they were walking together in the garden at Hampton-Court, that he found his health declining very fast, and that he could not live another summer, but charged his lordship not to mention this till after his majesty's death. We are told, that at the time of the king's death, Lord Portland was keeper of Windsor Great Park, and was displaced upon Queen Anne's accession to the throne: we are not, however, made acquainted with the time when his lordship became first possessed of that post. After King William's death, the earl did not, at least openly, concern himself with public affairs, but betook himself to a retired life, in a most exemplary way, at his seat at Bulstrode in the county of Bucks, where he erected and plentifully endowed a free-school, and did many other charities. His lordship had an admirable taste for gardening, and took great delight in improving and beautifying his own gardens, which he made very elegant and curious. At length, being taken ill of a pleurisy and malignant fever, after about a week's illness he died, November 23, 1709, in the sixty-first year of his age, leaving behind him a very plentiful fortune, being at that time reputed one of the richest subjects in Europe.

BENTINCK (Henry), second son of William earl of Portland, whilst he was a commoner was elected in two parliaments in the reign of Queen Anne one of the knights of the shire for the county of Southampton; and on the 21st of July, 1710, was made captain of the first troop of horse-guards, in the room of the Earl of Albemarle. He was created by King George the First, marquis of Tichfield in Hampshire, and duke of Portland, by letters patent, bearing date the 16th of July, 1706.

When the king went to Cambridge in 1717, and the ceremony of admitting and creating several degrees was, accord-

ing to custom, performed in his royal presence, his Grace the Duke of Portland was created doctor of laws. His grace was also one of the gentlemen of King George the First's bed-chamber; and on the 9th of September, 1721, was appointed captain-general and governor of the island of Jamaica, where his grace departed this life, of a fever, on the 4th of July, 1726, in the forty-fifth year of his age.

BERCHTOSGABEN, a town of Germany in Saltzburg, which serves all the neighbourhood with salt; seated on the river Aa, 10 miles south-west of Saltzburg. Long. 13. o. E. Lat. 47. 30. N.

BERDOA, a town of Persia, in a fertile plain, 10 miles west of the river Cour, and 62 south-east of Grandga. Long. 48. o. E. Lat. 41. o. N.

BERELLY, a small city of Hindoostan Proper, capital of Rohilcund, or country of the Rohillas, which was conquered by the Nabob of Oude in 1774. It lies half way between Lucknow and Delhi, 120 miles from each. Long. 79. 40. E. Lat. 28. 30. N.

BERING (Sinus), of Copenhagen, a Latin lyric poet, flourished about 1660.

BERGMAN (*Encycl.*). In our original article, vol. I. we have inadvertently said, that Professor Bergman's Essays were collected and translated by Dr. Ed. Cullen, and published in two vols. 8vo. They were collected and published in six octavo volumes. The 1st and 2d at Upsal, by himself; the 3d at Leipzig, after his death, by Lefke; the 4th, 5th, and 6th, at Leipzig also, under the inspection of Professor Hebenfreit. Three of these volumes (viz. 1. 2. 4.) have been translated by Dr. Cullen. The last of them was published at Edinburgh in 1791. Besides these six volumes of Essays, Professor Bergman published several other works in the Swedish and other Transactions, which are not yet added to the collection of his pieces; to say nothing of a very valuable work on Physical Geography in Swedish, in two quarto volumes, which, we have heard, has been translated into English. Its value is such, that Professor Hebenfreit is said to have intended a translation of it into Latin; and that he proposed publishing it in that language for the promotion of rational geology. In the six volumes are contained 72 essays; but the catalogue of his works given at the end of Peter James Hjelms Gedachtnisrede contains one hundred and six.

BERGMANNIAN SOCIETY. This society was instituted for the promotion of those sciences in which Bergman chiefly excelled; namely, Chemistry, Geology, Natural History, Mineralogy, and Electricity. It consists of about 150 members, of whom one third may be foreigners, distinguished by their skillful and fortunate researches in these departments of science. No person can be admitted a member or fellow (F. B. S. or S. B. S.) unless of just celebrity in them. The present of a flint will not secure an election into it, as a fortunate *Leontodon Taraxacum* has done into another society formerly more respectable. Of the Bergmannian Society, Henry Hodgson, M.D. of Market Rasen, Lincolnshire, was chosen president on the 16th September, 1795. At the same time J. Atzelius Arvidsson (Bergman's successor in the chemical chair at Upsal), Charles William Nöfe, M.D. of Elberfeld, Professor Pentland, of Dublin, Dr. Priestley, and several other illustrious philosophers, were elected fellows. It is usual to address communications on the immediate objects of the society to the president.

BERGUES, St. Vinox, a town of France, in the department of the North, and late county of Flanders, fortified by Vauban. It is seated on the river Colme, at the foot of a mountain, five miles south of Dunkirk. Long. 2. 28. E. Lat. 50. 57. N.

BERKELEY, a town of Gloucestershire, with a market on Wednesday. It is governed by a mayor and aldermen. Here

is a castle begun in the reign of Henry I. and finished in that of Stephen. It stands on a rising ground, commanding a delightful view of the surrounding country and the Severn. In the civil wars it suffered considerably, as it did a few years ago by an accidental fire. The room in which Edward II. was imprisoned is still to be seen. In the church are some elegant monuments of the Berkeleys. It is 18 miles from Gloucester, and 113 north-west of London.

BERKHAMSTEAD, a town of Herts, with a market on Monday. It was anciently a Roman town; and Roman coins have been often dug up here. On the north side of the town are the remains of a castle, the residence of the kings of Mercia. In 697 a parliament was held here, and Ina's laws published. Here William the Conqueror swore to his nobility to maintain the laws made by his predecessors. Henry II. kept his court in this town, and granted to it many privileges; and James I. whose children were nursed here, made it a corporation; but this government was dropped in the civil wars. Here are two hospitals, a handsome Gothic church, and a free-school. It is 26 miles north-west of London. Long. o. 31. W. Lat. 51. 46. N.

BERNARD, a town of Germany in the electorate of Brandenburg, five miles from Berlin, noted for excellent beer.

BERNARDI (John), was the son of Count Francis Bernardi, resident in England from the republic of Genoa, and was descended from a very ancient and honourable family, created for their services to the House of Austria, counts of the holy Roman empire. He was born in 1657, and was very early insured to misfortunes and imprisonment; for his father being disgusted at some ill usage he received from the government of Genoa, refused to return thither, and being himself a native of England, retired into Worcestershire, where he settled; and being a great lover of gardening, spent a considerable fortune in improvements of that kind, which, however, did not so far amuse or divert him, as to extinguish his sense of the injuries he had received, which fanned his temper to such a degree, that he frequently confined his son John, for very slight causes, to a dark room, where he allowed him only bread and small-beer for several days, which hard usage so wrought upon his disposition, that he resolved, at all events, to leave his father's house, and to throw himself into the world, though a perfect child. Accordingly, in 1670 he quitted his father's seat, with a full resolution never to return thither while the old man lived. He travelled that night sixteen miles in the road to Coventry, and as day-light began to appear, he took shelter in the house of a wheelwright, who, upon hearing his melancholy story, promised to conceal him, which he performed, and put him into a little room from whence he could look upon the road, and in which he had not been long before he saw his father on horseback, who enquired of the wheelwright if he had seen such a boy as he described, which being answered in the negative, prevented the young man from being carried back to confinement. When the second night came on, he set out again for Packington-hall, the seat of Sir Clement Eddier, who married the famous Mrs. Jane Lane, very instrumental in preserving King Charles II. after the famous battle at Worcester. But on his coming thither, being informed that Sir Clement and his lady were in London, he followed them up to town, and was very hospitably received, the lady having been very kind to him at his father's, and often intreated the old gentleman to deal more indulgently with his son, and to afford him a liberal education. He was by her recommended to a near relation, Captain Littleton Clent, who was then in garrison at Portsmouth, who took him into his company, and caused him to be taught his exercise as a soldier, which gave him the first taste for a military life. While he was under the protection of this gentle-

man, he very narrowly escaped a misfortune, which would have put an early end to his troubles and his life. On the conclusion of the Dutch war, Captain Clent being broke, was no other way in a condition of expelling his kindness for Mr. Bernardi, than by making him a present of twenty pounds. But the loss of his patron was not the only mischief which befell him in the year 1673; for he had the small-pox soon after, which reduced him very low both in constitution and fortune. In this distress he addressed himself to his godfather, Colonel Anselme, who proposed to him going over to Holland, with which he readily complied, and soon after his arrival entered as a private soldier into the service of the States, and then lifted in one of the English independent companies. He was in the famous action of Senef, in which the Prince of Condé fell on the rear of the Prince of Orange's army, and took part of his baggage, but after an obstinate engagement was obliged to retire. He was also present at the siege of Oudenarde, and afterwards at that of Grave, where he served in the company of Captain Philip Savage, and had his share in a very dangerous attack on the counterescarp, in which he was wounded. The place surrendered on the 29th of October, 1674. Soon after this, the English troops in the service of the States being reformed, Mr. Bernardi obtained an ensign's commission from the Prince of Orange, dated the 2d of February, 1675, in the company of his godfather, who was appointed lieutenant-colonel of Disney's regiment. In June following he was removed, with his godfather, to another regiment, commanded by Sir John Fenwick, and at the close of the year had the misfortune to be wounded in endeavouring to part two gentlemen in a duel. He was present the succeeding year at the siege of Maestricht, where he had the misfortune to lose the sight of one of his eyes, and to be shot through one of his arms, the bones of which were shivered to splinters; when, taking his arm in the lap of his coat, he crowded back to the breach, and fell down to the bottom among the dead. A soldier of his seeing him fall, jumped after him, took him up in his arms, and carried him to the surgeons in the trenches, where he was dressed. The Prince of Orange being informed of his behaviour, and that the lieutenant of the major's company of that regiment was killed in the attack, gave his commission to Mr. Bernardi: but it appearing afterwards that the lieutenant was only taken prisoner, he missed of this preferment. In April 1677 he married a Dutch lady of a good family, with whom he lived comfortably eleven years. He had a share the next campaign in the battle of St. Omers, at the close of which he was appointed lieutenant in Captain Philip Savage's company, in which he first served by a commission from the Prince of Orange, dated September 6, 1677. He was present the next year in the battle of Mons, which was the last action in the war. After the peace his godfather, Colonel Anselme, was so reduced as to be obliged to serve as a private man under Mr. Bernardi, who allowed him double pay, and excused him from duty. In 1683 Mr. Bernardi was made captain-lieutenant in Colonel Monk's company; and at this time he was in so great favour with the Prince of Orange, that upon the death of Captain Jasper Paston, brother to the Earl of Yarmouth, he had his company given him by a commission from the prince, dated the 17th of November, 1685, which was confirmed by a commission from the States, dated the 3d of December following. At this time his circumstances were very easy, and he had just reason to be thankful to Providence for the condition he was in, having obtained by his merit a company at the age of twenty-seven, the profits of which, together with his wife's fortune, brought him in a clear revenue of 500*l.* a-year. But it was not long that he continued in this easy and happy situation: for King James II. in the year 1687, having conceived some displeasure against the States-

General, demanded the six regiments of British troops that were in their service, and which had been so for fifteen years. This the States refused; but, at the same time, did not constrain the officers to serve them against their will, though care was taken to represent to them, in very strong terms, the difference between remaining upon a fettered establishment, and returning home upon an uncertainty. This had such an effect, that out of two hundred and forty officers that were in the whole brigade, no more than sixty thought proper to obey the king's commands, amongst whom was Captain Bernardi. King James was no sooner informed of this, than he ordered a yacht to sail for Holland to bring those gentlemen over, to whom he sent allo three months' pay; and upon their arrival in England, immediately raised three new regiments, in order to replace those officers in their commands; and, at the same time, issued a proclamation, declaring all officers that remained in the service of the States of Holland rebels. But the scene was very soon changed: his serene highness proceeded soon after on his expedition to England, which brought about the Revolution. One of the first steps taken by his highness after the king was withdrawn, was to send an association to every one of the regiments then in being, which all the officers were required to sign, importing, that they were determined to defend the prince against all persons whatever, and such officers as refused it, were ordered to quit their commands. Amongst these was Captain Bernardi, who having obtained a pass for himself and his family, he transported them to Calais, where, finding many persons of his own principles in great distress, the captain pledged his effects for fifty pounds for their relief, though they were worth double as much, and the consequence was, that he lost both effects and money. He proceeded from thence to St. Germain's, where he was very kindly received, and after a short repose, made a long and fatiguing march to Breff, to wait the return of the French fleet, which carried King James to Ireland, and speedily transported 2300 of his adherents to the same kingdom. This was in the month of April, 1689, and it was with great difficulty they landed these people in Bantry Bay on the 11th of May, and the next day engaged the English fleet under Admiral Herbert. The Earl of Dover, who was appointed by King James to receive these recruits, conducted them directly to Dublin, where they were formed into separate corps, and all the officers had commissions given them. Amongst the rest, Mr. Bernardi was appointed major of an Irish regiment, which was soon disbanded for mutiny; and then he had the like command in the regiment of McCarthy Moor, a great Irish chief, under whom he served for some time. After Marshal Schomberg landed in that kingdom with twenty thousand men from England, King James found his affairs in a very declining condition; however, as he had still a superior army, he marched to Ardee, which he fortified, and thereby kept the marshal in his camp near Dundalk, which being a marish unwholesome place, half his troops soon died of fluxes. While King James was at Ardee, he formed a design of sending the Earl of Seaforth into Scotland, in hopes that the presence of that nobleman might supply the loss of the famous Viscount Dundee, then lately killed in his service. To assist the earl in this enterprise, the king directed Major Bernardi and another field officer to attend him, which they did, and embarking on board a man-of-war at Galway, in the west of Ireland, steered their course for Scotland; but before they got clear of the Irish coast, they met with a storm, by which their bowsprit and fore-mast were both broke to pieces; upon which the captain with much difficulty and danger worked the ship into Broad-haven, in the province of Connaught, from whence the earl sent Major Bernardi to King James, then in his camp at Ardee, to acquaint him with this unlucky accident, which hindered his intended voyage.

King James thereupon ordered the ship back again to Galway, and put off the earl's voyage to the next spring, when he proceeded with Sir Thomas Southwell and Major Bernardi for Scotland, where he speedily raised a great body of men for King James's service, and made the necessary dispositions for joining Major-general Buchan, who commanded the remains of Lord Dundee's forces, in order to form the siege of Inverness. But the earl was disappointed in this design by the speedy march of Major-general Mackay, with a considerable body of regular troops into those parts; and while things were in this situation, the news came of the total defeat of King James's army at the Boyne, upon which Sir Thomas Southwell prevailed upon the earl to dismiss his forces, and to surrender himself prisoner to Major-general Mackay upon honourable terms. The earl taking this step without the consent of his uncle, Mr. Colin Mackenzie, and the rest of his friends; it provoked them to such a degree, that they would have cut Sir Thomas Southwell to pieces, if Major Bernardi had not interposed and prevented it. This Mr. Colin Mackenzie took Major Bernardi, and the rest of the officers that came with him from Ireland, under his protection, and conducted them safely to Major-general Buchan, who was then a hundred miles distance, and who, upon hearing of the Earl of Seaforth's conduct, had dismissed most of his forces. Major Bernardi had now nothing more to transact in the Highlands; and, therefore, as his presence there could be of no service, he desired to go to England, and Major-general Buchan approved of it, and sent for the Laird of Glenco to come with forty of his vassals to receive Bernardi at Invergary, and to conduct and guard him to the Braes of Monteth, being near a hundred miles, and very difficult travelling over rocks and mountains in that season of the year, near the end of October. A great part of the journey was to be performed in the night-time, several detachments of King William's forces lying in their way, particularly at Inverlochry, or Fort-William, a place where was a garrison of twelve hundred men, and there was no way to climb up an high mountain, but near the gate of the said fortrefs, so that it was impossible to pass them but when asleep and their gate locked. The Laird of Glenco's country lying within 20 miles of that garrison, Major Bernardi arrived safe at that gentleman's house, and remained there some days to rest himself and recover his strength. After having reposited himself there six days, he desired to proceed on his journey, and the laird appointed forty of his best men, under the command of a relation of his own, to conduct him to the Braes of Monteth, places as dangerous and difficult to pass as any of the way he had come before. The many inconveniences, of small garrisons of the government, were in their way, and their parties were continually about the country in the day-time. This made the second part of Major Bernardi's journey to be mostly night-work: however, he arrived safe at the Braes, at which place he was recommended by Major-general Buchan, to one Colonel Duncan Graham, to be then farther directed by him. Major Bernardi proceeded on his journey from the Braes of Monteth, under the conduct of a guide appointed him by Colonel Graham, and having no more need of guards, he arrived at Edinburgh in the month of November, in the year 1691. The magistrates of that city having heard some gentlemen were come from the Highlands, ordered their gates to be shut, and a general search to be made for them. Bernardi's landlord getting notice of it, conducted him out of town but half an hour before the order was put in execution, otherwise his journey at that time had terminated in some prison at Edinburgh: but escaping that, and some other dangers, he travelled on from thence to London, meeting with no more difficulties than those of a long winter's journey. Having finished his affairs in London, by disposing of some effects he had

left with a friend when he went out of England, and by selling his Scots horses, he purposed to go over to Flanders, and meeting with two gentlemen of his acquaintance ready to make the same voyage, he went with them to Colchester, where they were recommended to the master of a ship, who was in a short time to carry over a lady of great quality to Ostend; but the wind happening to be fixed in the east, the lady ordered her trunks to be put on board, and then went to a gentleman's house about five miles off, charging the master to send for her as soon as the wind came fair. Bernardi and his friends met with two other gentlemen who were strangers to them, and also unknown in the town, who were come thither to get a passage over in the same ship. They joined company, and lodged all together for some nights at Mr. Cook's, then post-master in Colchester; but having notice of some people's inquisitiveness about them, Bernardi and his two friends went to a gentleman's house about a mile out of the town, and the other two gentlemen went to the master of the ship's house. The second night after Bernardi and his friends went into the country, intimation was given, that Sir Isaac Rebow, a justice of the peace, had issued out his warrant to apprehend them, and bring them before him; and the wind coming fair the same night, they went directly to the master of the ship's house to go on board. The master of the ship told them, that he had sent a messenger to the lady, and expected her in an hour more, and sent one of his men to conduct them on board a ship, and said he would follow them, with the other two gentlemen at his house, as soon as the lady came. A messenger came from the lady, that she could not possibly come before the next day in the afternoon. Bernardi and his two friends continued on ship-board to avoid the justice's warrant. The next day, towards the evening, came a company of trained bands, with five hundred country people, to the key, where the ship then lay dry at low water, about two miles from the town, and Bernardi and the two gentlemen with him were seized, and carried directly to Colchester gaol, where the other two gentlemen, and the master of the ship, had before been made prisoners. The lady who occasioned all this stir was the Countess of Errol, with whom Mr. Bernardi was not at all acquainted; however, it cost him a great deal of trouble, and hindered him from pursuing any settled course of life till a year and a half afterwards, that a bill being preferred against him and his friends in Essex for high-treason was rejected; by which he escaped, indeed, any further suffering on this head, but at the expence of several hundred pounds, a loss almost insupportable to a man already of a broken fortune. He went afterwards over to Holland with the Earl of Nottingham's pails, who was then secretary of state, and returning within the time prescribed, merited thereby some farther indulgences from his lordship. The times being now dangerous for a man of Major Bernardi's sentiments, who could scarcely live so cautiously as not to give some offence, he resolved to retire into the country, where he lived peaceably, and without seeing much company, for some months, at a house near Brentford. But being obliged to quit this house, on accounts of its changing its owner, he came to London again about Christmas 1695, which proved his ruin by a series of very unfortunate accidents, supposing what he constantly professed to be true, that he was in no respect privy to the base and barbarous conspiracy for assassinating King William. For being unhappily at a tavern on Tower-hill, with one Captain Rookwood, who was his old acquaintance, and who was involved in that affair, they were seized together, and sent to the Compter, and afterwards committed to prison, where he died, September 20,

1736.

BERN-CASTEL, a town of Germany, in the electorate of Treves, with a castle, built in 1277. It is remarkable for its

good wine, and is seated on the river Moselle, between Trarbach and Welden.

BERNERS (Juliana), was born at Roding in Essex, about the beginning of the fifteenth century, being the daughter of Sir James Berners, of Berners Roding, and sister of Richard Lord Berners. The education of Juliana seems to have been the very best which that age could afford; and her attainments were such, that she is celebrated by various authors for her uncommon learning, and her other fine accomplishments. Her extraordinary qualifications rendered her every way capable and deserving of the office she bore, which was that of prioress of Sopewell nunnery. This was a cell to, and very near, St. Alban's; and a good part of the shell of it is still standing. Here she lived in high esteem, and flourished, according to Bale, Tanner, and Ballard, about the year 1460; but if what we have said concerning her birth be the true account, she must have flourished somewhat earlier. She was a very beautiful lady, of great spirit, and loved masculine exercises, such as hawking, hunting, &c. With these sports she used frequently to recreate herself; and so thoroughly was she skilled in them, that she wrote treatises of hawking, hunting, and heraldry. So well esteemed were Juliana Berners's treatises, and indeed so popular were the subjects on which they were written, that they were published in the very infancy of the art of printing. That part of our abbe's work which relates to hunting is written in rhyme. It is spoken in her own person; in which, being otherwise a woman of authority, she assumes the title of dame. The barbarism of the times strongly appears in the indelicate expressions which Juliana Berners often uses; and which are equally incompatible with her sex and profession. The book on Armory begins with the following curious piece of sacred heraldry: "Of the offspring of the gentelman Jafeth, come Habraham, Moyles, Aron, and the priestetts; and also the kyngde of the right lyne of Mary, of whom that gentelman Jhesus was borne, very God and man; after his manhode kyngde of the land of Jude and of Jues, gentelman by his modre Mary, prince of cote armure, &c." The most diligent enquirers have not been able to determine the exact period of Juliana Berners's decease.

BEROEIA (anc. geog.), a noble city of Macedonia, to the south of Edessa, or *Ægæ*, and south-east of Certus. The people are commended in Scripture for their reception of the Gospel on a fair and impartial examination: now supposed to be *Allepo*. See that Article.

BERQUIN (Lewis de), a gentleman of Artois, who was burnt for being a Protestant, at Paris, in 1529. He was lord of a village, whence he took his name, and for some time made a considerable figure at the court of France, where he was honoured with the title of King's counsellor. Erasmus says, his great crime was openly professing to hate the monks; and that from hence arose his warm contest with William Quernus, one of the most violent inquisitors of his time. A charge of heresy was mustered up against him, and the articles of his accusation were drawn out of a book which he had published: he was thereupon committed to prison; but, when his affair came to a trial, he was acquitted by the judges. His accusers pretended that he would not have escaped, had not the king interposed his authority; but BERQUIN himself ascribed it entirely to the justice of his cause, and was no more cautious than before. Some time after Noel Beda and his emissaries made extracts from some of his books, and accused him of pernicious errors, whereupon he was again sent to prison, and the cause being tried, sentence was pronounced against him; viz. that his books be committed to the flames, that he retract his errors, and make a proper submission, and if he refuse to comply, that he be burnt. Being a man of an undaunted, inflexible spirit,

he would submit to nothing; and in all probability would at this time have suffered death, had not some of the judges, who perceived the violence of his accusers, got the affair to be again heard and examined. It is thought this was owing to the intercession of madame the Regent. In the mean time, Francis I. returning from Spain, and finding the danger of his counsellor from Beda and his faction, wrote to the parliament, telling them to be cautious how they proceeded, for that he himself would take cognizance of the affair. Soon after Berguin was set at liberty, which gave him such courage, that he turned accuser against his accusers: he prosecuted them for irreligion; though, if he had taken the advice of Erasmus, he would have esteemed it a sufficient triumph that he had got free from the persecution of such people. But not content, says Mr. Bayle, with escaping from his accusers, he must needs have the honour of a victory, as a reward of his labour. Is not this like the crane (continues Bayle), who asked for a reward after he had got his neck safe and found out of the wolf's throat? He was sent a third time to prison and condemned to a public recantation, and perpetual imprisonment. He would not acquiesce in this judgment; and being therefore condemned as an obstinate heretic, he was strangled on the Greve, and afterwards burnt. He suffered death with great constancy and resolution, being then about forty years of age.

BERRIMAN (Dr. William), was the son of Mr. John Berriman, apothecary, in Bishopsgate-street, London, where he was born on the 24th of September, 1688. He studied at Oriel College, Oxford, where he took his several degrees, and became curate and lecturer of Allhallows in Thames-street, and lecturer of St. Michael's, Queenhithe. In 1720 he was appointed domestic chaplain to Dr. Robinson, bishop of London, who soon after collated him to the living of St. Andrew's Underhaft; and in 1727 he was elected fellow of Eton College. He died on the 5th of February, 1750, in the 62d year of his age. He wrote, 1. A reasonable Review of Mr. Whiston's Account of primitive Doxologies, 2. An historical Account of the Trinitarian Controversy, in eight Sermons, at Lady Moyer's Lecture. 3. Brief Remarks on Mr. Chandler's Introduction to the History of the Inquisition. 4. Sermons at Boyle's Lectures, 2 vols. 8vo. 5. Christian Doctrines and Duties explained and recommended, in 2 vols. 8vo.; and other works.

BERTHEAU (Charles), an eminent French Protestant divine, long resident in the city of London, was born in the year 1666, at Montpellier, where his father, whose name also was Charles, was minister. He studied philosophy and divinity, partly in France, and partly in Holland, and was admitted a minister in the synod held at Vigan in 1681, being then only twenty-one years of age. He was, however, the next year chosen pastor to the church of Montpellier; but he did not make any long stay in that city, for he was soon after promoted to be one of the ministers of the church of Paris, which met at Charenton. He continued in that station about two years, and though he was yet in very early life, he discharged the pastoral duties to which he was called in a manner greatly to his reputation. But when Lewis the Fourteenth thought proper, by the revocation of the edict of Nantz, to drive his Protestant subjects out of France, an act equally repugnant to justice, humanity, and the dictates of sound policy, Mr. Bertheau found himself obliged to quit his native country. He accordingly came to England in 1685, and the following year was chosen one of the ministers of the Walloon church, in Threadneedle-street, London, where he discharged the duties of the pastoral office for about forty-four years, in such a manner as procured very general applause. He died on the 25th of December, 1732, in the 73d year of his age,

exceedingly regretted by his congregation, and by all who had the pleasure of being acquainted with him. He was the author of two volumes of sermons, and Discourses upon the Catechism.

BERTIUS (Peter), a man distinguished by religious adventures as well as letters, was born in a small town of Flanders, 1565. He became professor of philosophy at Leyden, but lost his professorship for taking part with the Arminians. He went to Paris, where he abjured the Protestant religion in 1620, was made cosmographer to the king, and royal professor-extraordinary of mathematics. He died in 1629, aged 64, and left some better things behind him than he had written about the Gomarists and Arminians. 1. *Commentaria Rerum Germanicarum*, 12mo. 2. A good edition of Ptolemy's Geography, in Greek and Latin, folio. 3. *De Aggeribus et Pontibus*. 4. *Introductio in Universam Geographiam*.

BERTON (William), an eminent divine of the fourteenth century, and doctor in that faculty, flourished about the year 1381, in the reign of Richard II. and was some time chancellor of the university of Oxford. He is chiefly remarkable for his opposition to the doctrines of Wickliff; for by virtue of his office as governor of the university, he appointed twelve censors, six of the order of mendicants, and six seculars, consisting of divines and lawyers, to examine Wickliff's opinions, who accordingly declared him an heretic. He wrote likewise against that pretended heresiarch; and for this reason it is that his character is so differently represented by different authors.

BERWICK, a shire in Scotland, bounded by the river Tweed, on the south; by Lothian, on the north; by the German Ocean, on the east; and by Tiviotdale on the west. It abounds with corn and grails, and has in it several seats of persons of quality. The principal rivers are the Tweed, the Whitecar, Blackadder, Eye, and Ednel. The principal place is the town and castle of Dunfermline, which is the best place for trade in the country. It sends two members to parliament.

BERWYN HILLS, lofty hills at the N. E. angle of Merionethshire, beneath which spreads the fine vale, in which flows the infant river Dee.

BERY, or BURY, the villa or seat of habitation of a nobleman, a dwelling or mansion-house, being the chief of a manor: from the Saxon *beorg*, which signifies a *hill* or *castle*; for heretofore noblemen's seats were castles situated on hills, of which we have still some remains; as in Herefordshire, there are the *beries* of Stockton, Hope, &c. It was anciently taken for a sanctuary.

BERYTUS (anc. geog.), a sea-port town of Phœnicia on the Mediterranean, so ancient as to be thought to have been built by Saturn. It was destroyed by Tryphon, but rebuilt by the Romans. Agrippa placed here two legions, whence it became a colony. It enjoyed the *jus italicum*, and had an excellent school for the study of the law in Justinian's time. Now *Beroet*; which see.

BESSICA (anc. geog.), a district of Thrace towards mount Hæmus to the south of the Hebrus. It was inhabited by a fierce and barbarous people noted for their robberies. Their chief city Uscudama is now known by the name of *Adrianople*. They lived under their own kings till the consulate of M. Licinius Lucullus and C. Cassius Varus; when the consul Lucullus invaded their country, and having gained a great victory over them, took their metropolis, and subjected the whole nation to the Roman laws. The Romans, notwithstanding they had subdued them by force of arms, still suffered them to live under their own kings; for Piso, while he governed Macedon in quality of proconsul, having treacherously seized Rabecentus, whom Suetonius calls *prince of the Bessi*,

caused him to be publicly beheaded. This affront so exasperated the whole nation, that they revolted; but were overthrown in a great battle by Octavius the father of Augustus. During the civil wars of Rome they attempted anew to recover their liberty, but were again defeated by the famous M. Brutus. In the reign of Augustus one Vologeses, a native of the country, and priest of Bacchus, having, under pretence of religion, drawn together great crowds of people, made himself master of the whole country, and, entering the Chersonesus, committed there the most dreadful ravages. He was at last, however, overcome by L. Pilo; who obliged the savage inhabitants to lay down their arms, and submit to such conditions as he was pleased to impose upon them. From this time the Bessi continued subject to the Romans without attempting any more to regain their liberty.

BESSIS (*Encycl.*) mispelt BESIS.

BETA, the BÊTE (*Encycl.*). The following account is given of the extraction of sugar from the beet-root, by Lampadius, professor of chemistry at the mineral academy of Freybourg. He took a hundred pounds of the yellow beet, called, in Germany, *runkel-ruben*, by Linneus *Beta ciclaris*, from which he obtained four pounds of sugar. He peeled his beets, and removed all the sticky parts, then raised them, and squeezed out the juice: by this process he obtained forty-four pounds of liquid. This he placed in a stew-pan, and then, after heating some charcoal thoroughly, broke it into grains of the size of a pea, of which he threw forty-four ounces into the liquor, taking care not to throw in any of the dust, which would have discoloured the sugar: he then boiled the whole for a quarter of an hour, after which he filtered it through flannel, and then replaced the liquor thus filtered on the fire, to gain the consistency of syrup. On this operation the crystallization principally depends. When the juice had attained the consistency required, he put it in a cool place, and left it there a fortnight; the crystallization took place, and at the end of that period it appeared like a kind of pap of a dark brown colour, and when he took up a small quantity in his fingers, he could easily feel the crystallized particles in small grains. Lampadius then passed the whole contents through a linen cloth, pressing it strongly. The crystals which remained in the cloth were put in lime-water, in which was mixed a pound of ox's blood; the whole was then placed on the fire, and great care taken during the boiling to keep it well skimmed: it was then filtered through flannel, and put in a cool place to crystallize: after remaining eight-and-forty hours, it was turned out in a linen cloth, and the crystals found to be whiter and larger than at first: it was again boiled in lime-water, with a pound of skimmed milk, still taking care as it boiled to keep it free from scum; the crystals obtained this time were blue; they were reduced to powder, which, being placed in a mould properly wetted, turned out a sugar loaf of four pounds weight, pretty white, and in flavour exactly similar to the sugar in general use. In February Professor Lampadius repeated his experiments: the juice he obtained was not quite so white as the first, and produced him but three pounds and a half of sugar. From the different residues and syrups obtained by filtration, he acquired each time seven pounds of a kind of rum or arrack, which was very strong. Encouraged by this success, Professor Lampadius, and a rich citizen and farmer, named Kanitzki, established an extensive sugar manufactory, of the success of which Lampadius has published an account.

BETHAM (Edward, B.D.), received his education at Eton, of which seminary he was a distinguished ornament; was elected from thence to King's College, Cambridge, in 1728, of which he became a fellow in 1731; was some time bursar, and by the provost and fellows, when senior fellow,

was presented to the living of Greenford in Middlesex. In 1771 the provost and fellows of Eton elected him to the vacant fellowship in that society. So unexceptionable was his life, that he may truly be said to have made no enemy in the progress of it. Of manners gentle, of friendship most susceptible, of knowledge extensive, he acquired the praise and commendation of all men. His fortune was not extensive, yet his liberality kept more than equal pace with it, and pointed out objects and things to which it was impossible for his nature to resist lending his assistance. In his life-time he gave two thousand pounds for the better maintaining a botanical garden at Cambridge, thereby encouraging a study which did peculiar honour to his taste, and materially benefited mankind. So humane was his disposition, that he founded and endowed a charity-school in his own parish; and this most nobly in his life-time, when avarice might have forbid it, or the fear of want might have excepted against it. As in his life he indicated the most extensive liberality, so at his death he exhibited a lasting record of his gratitude. Impressed with the highest sense of the munificence of the royal founder of Eton, within whose walls he had imbibed the first seeds of education, he, by his will, directed a statue of marble, in honour of Henry VI. to be erected at the expence of six hundred pounds.

BETHLEHEM, a town of North America, in the State of Pennsylvania, on the river Lehigh, a western branch of the Delaware. The town being partly on an eminence, and partly on the lower banks of the Manakes (a fine creek, affording trout and other fish), has a very pleasant and healthy situation, and is frequently visited, in summer, by the gentry from different parts. It is the principal settlement of the Moravians in America. They were fixed here by Count Zinzendorf in 1741. They have a church; a public meeting-hall; the single brethren's or young men's house, where the single tradesmen, journeymen, and apprentices, are boarded at a moderate rate, and have morning and evening prayers; the single sisters' or young women's house, where they live, and are employed, under the care of female inspectors, at liberty, however, to go about their business in the town, or to take a walk for recreation, and every year some of them are married; and a house for widows. The houses are 60 in number, mostly built of free-stone; and the inhabitants are between 500 and 600. The German language is more in use here than the English: the latter, however, is taught in the schools; and divine service is performed in both languages. Bethlehem is 53 miles north of Philadelphia. Long. 75. 8. W. Lat. 40. 37. N.

BETON, a kind of water-cement. The name of *Beton* is applied in France to every composition of mortar that is intended to keep out water, or to be used in works under water, and which is susceptible of becoming almost instantaneously solid.

Beton may be prepared in various ways. 1. The mortar of Lorient, when well prepared, holds water very well; I have used it for plastering the interfaces between the slabs of a terrace, and not the smallest filtration took place. I keep a mass of this mortar formed into the shape of a vase, which, when filled with water, and placed upon a sheet of paper, does not leave upon it any perceptible traces of humidity.

2. The mortar of Lafayette does not harden with equal rapidity; but when once it has become solid, it holds water very well without growing soft.

3. The mortar, of which Mr. Smeaton speaks, made with equal parts of lime and terras, is a real beton, or water cement, as it may be used in the water without becoming soft.

4. The mortars composed with Pozzolana may also be used in the water, and when once they have become hard, they are superior to all others in durability and resistance to the motions of the water.

The most common kind of water cement is that which is made with pure lime. It is formed into prisms of hard paste, which are sunk into the water to form a wall; or it is poured into a space, 21 or 22 centimeters in breadth, between two walls, in the manner of coffer-work, intended to confine the water in those parts of canals that are elevated above the ground.

BETTS (John), an eminent physician in the seventeenth century, was son of Mr. Edward Betts by his wife Dorothy, daughter of Mr. John Venables, of Rapley in Hampshire. He was born at Winchester, and educated there in grammar learning. From thence he was elected a scholar of Corpus Christi College in Oxford, in February, 1642. He took the degree of bachelor of arts, February 9, 1646. Being ejected by the visitors appointed by the parliament in 1648, he applied himself to the study of physic, and commenced doctor in that faculty, April 11, 1654, having accumulated the degrees. He practised with great success at London, but chiefly among the Roman-catholics, being himself of that persuasion. He was afterwards appointed physician in ordinary to King Charles II. The time of his death is not certainly known. Dr. Betts wrote the two following physical treatises, viz. 1. Of the Origin and Nature of the Blood. 2. The Anatomy of Thomas Parr, who died in the 152d year and ninth month of his age, with the observations of the celebrated Dr. William Harvey, and others of the king's physicians who were present.

BEVERGERN, a town of Germany, in the circle of Westphalia and diocese of Munster, 22 miles from that city.

BEVERIDGE (*Encycl.*). Bishop Beveridge has had a high character given him by several writers. The author of a letter published in the Guardian, having made an extract of the bishop's first sermon, in the second volume, relating to the Deity, tells us, that it may, for acuteness of judgment, ornament of speech, and true sublime, be compared with any of the choicest writings of the ancient fathers, or doctors of the church, who lived nearest to the apostles' times.

Bishop Beveridge left many learned works. Those published by himself are as follow: 1. De Linguarum Orientalium Prasentia. 2. Institutionum Chronologicarum Libri Duo. 3. Synodikon, five Pandectæ S.S. apotolorum et conciliorum. 4. Codex Canonum Ecclesiæ Primitivæ vindicatus et illustratus. 5. The Church Catechism explained. Besides the above-mentioned works of this prelate, we have the following, published after his death. 6. Private Thoughts upon Religion. 7. Private Thoughts upon a Christian Life. 8. The great Necessity and Advantage of public Prayer and frequent Communion. 9. One hundred and fifty Sermons and Discourses on several Subjects. 10. Theaurus Theologicus; or, a complete System of Divinity. 11. A Defence of the Book of Psalms, collected into English Metre, by Thomas Sternhold, John Hopkins, and others. 12. Exposition of the Thirty-nine Articles.

BEWCASTLE, a village in Cumberland on the river Leven, said to have been built about the time of the Norman conquest. The church is in ruins; and in the church-yard is an ancient cross, five yards high, on the sides of which are several sculptures, but the inscriptions are not legible.

BEWLEY, or **BEAULIEU**, a river in Scotland, which rises in the N. of Invernesshire, and flowing along the S. border of Ross-shire, forms the fine estuary on which stands Inverness, and Fort St. George, and which terminates in the frith of Murray. At the mouth of this river is the ferry of Kiskoff, near which is a good salmon fishery.

BEX, a village in the district of Aigle and canton of Bern, in Switzerland, near the little town of St. Maurice, which guards the entrance from that canton into the Lower

Valais. It is remarkable for its delightful situation, and the salt-works near it. The largest saline is entered by a passage cut out of the solid rock. Travellers, who have the curiosity to explore these gloomy abodes, are furnished with lighted torches, and dressed in a coarse habit, to defend them from the drippings that fall from the roof and sides of the passage.

BEZIERS, a town of France, in the department of Hérault and late province of Languedoc. It is an ancient, large, and handsome town, in a delightful situation, and was lately an episcopal see. The inhabitants are above 17,000 in number. The remains of a circus, and some inscriptions, bespeak its ancient grandeur. It has an academy of sciences and two hospitals; is seated near the Royal Canal, on a hill, at the foot of which flows the Obre; and is 8 miles N. of the Mediterranean, and 12 N.E. of Narbonne. Long. 3. 18. E. Lat. 21. 0. N.

BIBRACTE (anc. geog.), a citadel of the Ædii, according to Strabo; but Cæsar describes it as a town well fortified, very large and populous, and of the greatest authority among that nation. Now *Beauvèz*, or *Bevray*; a desolate place four miles to the north-west of Aulun.

BIBROCI (anc. geog.), an ancient people of Britain, now the *Hundred of Bray* in Berks.

BICETRE, a castle, two miles from Paris, where lunatics, beggars, vagabonds, pilferers, and dissolute young men, were imprisoned.

BIDASSOA, a river of Spain on the frontiers of France, which has its source in the Pyrenean mountains, and falls into the sea between Andaye and Fontarabia.

BIDIS (anc. geog.), a small city of Sicily not far from Syracuse, whose ruins are still to be seen in the territory of Syracuse, about fifteen miles to the south-west, with a church called S. GIOVANNI DI BIDINI.

BIGGAR, a town of Lanarkshire, in Scotland, ten miles S.E. of Carnwath. Here are the ruins of a collegiate church, founded in 1545.

BIJORE, a small province of Hindoostan Proper, lying between the rivers Indus and Attock, having Cabul on the W. the Bokharian mountains on the N. Calthmere on the E. and Pishour or Peshore on the S. Its dimensions are not more than fifty miles by twenty. It is full of mountains and wilds, inhabited by a savage and turbulent race. In this province is the famous mountain Aornus, the taking of which was one of the most splendid exploits of Alexander in these parts. Arrian describes it to be eighteen or twenty miles in circuit at the base, to be of vast elevation, and accessible by one narrow pass only, cut out of a rock. On the summit was a great extent of arable and pasture land, with springs of water, so that a garrison of 1000 men might subsist without any extraneous aid. This celebrated mountain lies about fifty-five miles N.N.E. from Pishour.

BILBILIS (anc. geog.), a town of Hispania Citerior, the birth-place of Martial; now supposed to be Calatayud in Arragon on the Xalon. See *CALATAYUD*.

BILMA, a vast burning desert of Africa, to the S.E. of Fezzan, between 21° and 25° N. lat. Surrounded by this dreary solitude, the traveller sees, with a dejected eye, the dead bodies of the birds that the violence of the wind has brought from happier regions; and listens, with horror, to the driving blast, the only sound that interrupts the awful repose of the desert.

BINGAZA, a sea-port of Africa in the kingdom of Tripoli, 140 miles W. of Derna. Long. 19. 10. E. Lat. 32. 20. N.

BINCHESTER, a village on the river Were, near the city of Durham. By several inscriptions and monuments,

it appears to have been a Roman town (Vinovium); many Roman coins are dug up here, which are called Binchester pennies; and two altars have been discovered, importing, that the twentieth legion was stationed in this place during the wars between the Picts and Caledonians.

BINGIUM (anc. geog.), a village or town of the Vangiones in Gallia Belgica, seated at the confluence of the Nave and Rhine. Now *Bingen*; which see.

BISCHOF'S WERDA, a town of Germany, in the circle of Upper Saxony, in Misnia, three miles from Dresden.

BISLEY, a village in Surrey, noted for a spring called St. John Baptist's Well, near the church of that name, whose water is said to be colder than any other in the summer, and warmer in the winter. It is three miles N. of Woking.

BISNAGUR, a town of the peninsula of Hindoostan, in the kingdom of Myfore, seated on the W. bank of the river Tungabadra. It was the capital of the ancient kingdom of Narsinga, and when visited by Cæsar Frederic in 1567, was a large city. It is 140 miles E. by S. of Goa. Long. 76. 10. E. Lat. 15. 30. N.

BLACK (Joseph), a physician very eminent in chemical science, was born at Bourdeaux, in France, of British parents, in 1728. He came at an early age to Great Britain, and was educated for the medical profession at the university of Glasgow. Dr. Cullen was at that time lecturer in chemistry there; and though his name does not rank high among the discoverers in that science, his methodical and investigating spirit rendered him a very useful teacher of it; and the popularity of chemical studies among the medical students of Scotland is greatly to be attributed to his mode of instruction. Mr. Black became one of his favourite pupils, enjoyed the free use of his laboratory, and assisted him in his experiments; whence he imbibed a decided taste for this branch of natural philosophy. In 1754 he took the degree of doctor of physic in the university of Edinburgh, where he had studied for some time; and the choice of a subject for his inaugural dissertation gave proof of his attachment to chemical topics. It was, *De humore acido a cibis orto, et Magnesia alba*. The germ of doctrine which he brought to light in his thesis, was fully developed in a paper read the next year before a society in Edinburgh, and published in the second volume of the *Essays Physical and Literary*, 1756, containing experiments on magnesia alba, quick-lime, and some other alkaline substances. In this, by the most ingenious and philosophical series of researches, he irrefragably proved the existence of an aerial fluid, which he denominated fixed air, the presence of which gave mildness, and its absence astringency, to alkalies and calcareous earths. This beautiful discovery is the undoubted parent of all those wonderful acquisitions in the knowledge of aerial bodies, which have immortalised the names of Cavendish, Priestley, Lavoisier, and others, and have given a new form to chemical philosophy. In 1756, on the removal of Dr. Cullen to Edinburgh, Dr. Black became professor of medicine, and lecturer in chemistry, at Glasgow. In the following year he enriched the science of chemistry with the curious and important doctrine of latent heat, in which he explained, in a most perspicuous and satisfactory manner, the connection of heat with fluidity, the phenomena that occur during the processes of freezing and boiling, and the manner in which they affect the thermometer. These discoveries, the result of his sagacity, and great experimental skill, have unquestionably led the way to all the subsequent facts relating to this part of chemistry, which have been added by several of the most eminent philosophers of the present day, and would alone have sufficed to confer celebrity on the name of Black. So high was his reputation, that on the

vacancy in the chemical chair of Edinburgh, in 1765, made by the removal of Dr. Cullen to another department, all eyes were turned on Dr. Black, as the only man adequate to sustain in his branch the superiority which that famed medical school had acquired in almost all others. He was accordingly elected, and for a long series of years discharged the duties of his office with universal applause, equally distinguishing himself by the ease, perspicuity, and elegance, with which he communicated instruction in his lectures, and his neatness and accuracy in performing experiments. Very complete manuscript copies of his lectures were taken by several of his students, especially in the earlier part of his teaching, when they contained a great variety of matter that was hardly yet known to the chemical world, and these copies, read with avidity by the lovers of this science, have highly contributed to secure to him the honour of those discoveries, and of that original mode of reasoning, which he scarcely made public in any other form.

He published nothing after his election to the chemical chair at Edinburgh, but a paper On the Effect of Boiling upon Water in disposing it to freeze more readily, printed in the sixty-fifth volume of the *London Philos. Trans.* for 1774; and *An Analysis of the Waters of some Hot-springs in Iceland*, in the third volume of the *Edinburgh Philos. Trans.* 1791. The latter contains matter very interesting to the chemist, concerning the formation of the siliceous stone, which is deposited by these wonderful springs; and has long been considered as a model of neatness and accuracy in the analysis of mineral waters. Two of his letters on chemical subjects have been published by Prof. Crell, and Lavoisier. It must, indeed, be confessed, that the active vigour of his mind seems to have undergone an early decline, and that, either through indolence, or a dislike of being taught by newer men, he suffered others to pass him in the very career of discovery which he had opened. He was long a strenuous opposer of the new theories in chemistry; and injured his character for candour and liberality, both by invisibly avoiding altogether the mention of some justly celebrated names, and by undervaluing the merits of others. At length, however, he became an avowed convert to the principles of the French chemists, and did not hesitate to make amends, by his applause, for his former opposition. Dr. Black never distinguished himself as a practical physician. His manners were simple; his temper cold and reserved; and his habits of life adapted to his own convenience. His health began to decline some years before his death, which at length took place suddenly in his sixty-second year, on December 6, 1799. He was never married. He was a member of the philosophical societies of London and Edinburgh; and obtained, at the solicitation of Lavoisier (a man superior to all envy), the distinguished honour of being one of the eight foreign members of the Academy of Sciences of Paris.

BLACKHEATH, a fine elevated plain, five miles S.E. of London, commanding beautiful prospects, and situated in the parishes of Greenwich, Lewisham, and Lee. It is adorned with handsome villas; and on the skirts of it, but in the parish of Charlton, is Morden College, for decayed merchants. On this plain Wat Tyler mustered 100,000 rebels. On the ascent to the heath, in the road to Dover, is a curious cavern, discovered in 1780.

BLACKLOCK (the Rev. Dr.), an ingenious divine and poet of Scotland, was born at Annan, in the county of Annandale, in Scotland, in the year 1721. His parents were natives of Cumberland, in which county his paternal ancestors had lived from time immemorial. Young Blacklock, before he was six years old, was totally deprived of his sight by the small-pox. His father had intended to bring him up to some trade; but as this misfortune rendered him incapable of any, all that this worthy parent could do, was to shew the utmost

attention to him, in this unhappy situation. This left such an indelible impression on the mind of his son, that he mentioned it, ever after, with the greatest warmth of gratitude and affection. Of this he has given a very striking proof in his poems. What was wanting to this poor youth, from the loss of his sight, and the narrowness of his fortune, seems to have been compensated to him by the goodness of his heart, and the capacities of his mind. It was very early that he shewed a strong inclination to poetry in particular. His father, and a few other friends, used often to read to divert him; and, among the rest, they read several passages out of some of our poets. These were his chief entertainment and delight. He heard them not only with uncommon pleasure, but with a sort of congenial enthusiasm; and, from loving and admiring them so much, he soon began to endeavour to imitate them. Among these early essays of his genius, there is one inserted in his works which was composed when he was only twelve years old, and has something very pretty in the turn of it, and very promising for one of such a tender age. Indeed, it is observable, that there have been few of our most eminent poets who have not given very early proofs of their genius this way; a quick and promising blossom pre-indicating, as it were, the abundance and excellence of the fruit which their maturity affords.

In 1749, Mr. Blacklock's father having been informed that a kiln, belonging to a son-in-law of his, was giving way, his solicitude for his interest made him venture in below the ribs, to see where the failure lay; when the principal beam coming down upon him, with eighty bushels of malt, he was instantly crushed to death.

When this melancholy event happened, Mr. Blacklock had just attained his nineteenth year; and as the loss of his good father occasioned his falling into more hands than he had been accustomed to before, he began by degrees to be more talked of, and his extraordinary talents to be better known. About a year after, he was sent for to Edinburgh by Dr. Stevenson, man of taste, and one of the physicians of that city, who had the goodness to supply him with every thing necessary for his living and studying in the university. Mr. Blacklock justly considered this gentleman as his Mæcenas; and the first poem in his works was a tribute of gratitude which he addressed to him, in imitation of the first Ode of Horace, by which the Roman bard has immortalized his illustrious patron.

Mr. Blacklock studied at Edinburgh ten years; in which time he not only acquired great knowledge in the Greek, Latin, and French languages, but made a considerable progress also in all the sciences. What was still more extraordinary, he attained great excellence in poetry, although the chief inlets to poetical ideas were closed up to him, and all the visible beauties of the creation had been long blotted from his memory. How far he contrived, by the uncommon force of his genius, to compensate for this vast defect; with what elegance and harmony he often wrote; with how much propriety, sense, and emotion, it is as easy to perceive, on reading his poems, as it is difficult to account for it. Considered in either of these lights, he must be allowed to have an extraordinary share of merit; but if thoroughly considered in all together, we may be allowed to say, with his friend the late celebrated Mr. Hume, that he must be regarded as a prodigy.

Mr. Hume, also, speaking of his moral character, observed, that "his modesty was equal to the goodness of his disposition, and the beauty of his genius;" and Mr. Spence, speaking of the pieces which Dr. Blacklock would not suffer to be printed, observes, that they abound with so many poetical beauties, that nothing could do him greater honour.

Mr. Spence's account of Mr. Blacklock having been first separately published in 1754, it was afterwards prefixed to a

quarto edition of his poems, published by subscription, under the patronage of that gentleman. By this publication a considerable sum of money was obtained, and, soon after, our poet was fixed in an eligible situation in the university of Edinburgh. In 1760 he contributed some poems to a Scotch collection, published at Edinburgh; and there being styled the Rev. Mr. Blacklock, it appeared that he had then entered into holy orders. In 1766 he obtained the degree of doctor of divinity; and in 1767 he published *Paraclesis, or Consolations deduced from natural and revealed Religion*, in two dissertations, 8vo. In 1768 he printed *Two Discourses on the Spirit and Evidences of Christianity*, translated from the French of M. Armand. These were his principal productions. At length, after a long life, devoid indeed of variety or adventure, but constantly devoted to the most laudable pursuits, this good and ingenious man terminated his mortal existence on the 14th of July, 1791, being then seventy years of age.

BLAIR (Dr. Hugh), an eminent Scots divine, was born in Edinburgh, on the 7th day of April, 1718. His father, Mr. John Blair, a respectable merchant in that city, was a descendant of the ancient family of Blair, in Ayrshire, and grandson of the famous Mr. Robert Blair, minister of St. Andrew's, chaplain to Charles I. and one of the most zealous and distinguished clergymen of that period. This worthy man, though firmly attached to the cause of freedom, and to the Presbyterian form of church government, by his steady, temperate conduct, commanded the respect even of his opponents; and in preference to all the other leaders of the covenanting party, he was selected by the king to fill an office which, from the circumstances of the time, gave frequent access to the royal person. His talents seem to have descended as an inheritance to his posterity. For, of the two sons who survived him, David, the eldest, was a clergyman of eminence in Edinburgh, father to Mr. Robert Blair, minister of Athelstonford, author of *The Grave* a poem; and grandfather to his majesty's solicitor general for Scotland. From his youngest son Hugh, who was a merchant, and filled a high station in the magistracy of Edinburgh, sprung the learned clergyman, who is the subject of this narrative.

After the usual grammatical course at school, Dr. Blair entered the Humanity Class in the University of Edinburgh, in October 1730, and spent eleven years there, assiduously employed in the literary and scientific studies prescribed by the church of Scotland. During this period he was distinguished among his companions both for diligence and proficiency; and obtained from the professors under whom he studied, repeated testimonies of approbation. One of them deserves to be mentioned particularly, because, in his own opinion, it determined the bent of his genius towards polite literature. An essay, *Περί του ωραίου*, or, *On the Beautiful*, written by him when a student of logic in the usual course of academical exercises, had the good fortune to attract the notice of Professor Stevenson, and, with circumstances honourable to the author, was appointed to be read in public at the conclusion of the session. This mark of distinction made a deep impression on his mind; and the essay which merited it, he ever after recollected with partial affection, and preserved to the day of his death as the first earnest of his literary reputation.

Dr. Blair now commenced a method of study which contributed much to the accuracy and extent of his knowledge, and which he continued to practise occasionally even after his reputation was fully established. It consisted in making abstracts of the most important works which he read, and in digesting them according to the train of his own thoughts. History, in particular, he resolved to study in this manner; and, in concert with some of his youthful associates, he constructed a very comprehensive scheme of *chronological tables*,

calculated to receive into its proper place every important fact that should occur. This scheme was afterwards improved, filled up, and given to the public by Dr. John Blair, prebendary of Westminster, in his well-known work on Chronology.

In 1739, Dr. Blair took the degree of A.M. on which occasion he defended a thesis *De Fundamentis et Obligatione Legis Nature*, which contains a short but masterly discussion of the subject, and exhibits, in elegant Latin, an outline of the moral principles which have been since more fully unfolded and illustrated in his discourses from the pulpit.

Edinburgh, about this period, numbered among her pupils many who were soon to make a distinguished figure in the civil, ecclesiastical, and literary history of their country. With most of them Dr. Blair entered into habits of intimate connection, which no future competition or jealousy occurred to interrupt, which held them united through life in their views of public good, and which had the most beneficial influence on their own improvement, on the progress of elegance and taste among their contemporaries, and on the general interests of the community to which they belonged.

After his academical course, he underwent the customary trials before the Presbytery of Edinburgh, and received a licence to preach the Gospel, on the 21st of October, 1741. His public life now commenced with very favourable prospects. The reputation which he brought from the university was fully justified by his first appearances in the pulpit; and, in a few months, the fame of his eloquence procured for him a presentation to the parish of Collieston in Fife, where he was ordained to the office of the holy ministry, on the 23d of September, 1742. But he was not permitted to remain long in this rural retreat. A vacancy in the second charge of the Canongate of Edinburgh furnished to his friends an opportunity of recalling him to a station more suited to his talents. And, though one of the most popular and eloquent clergymen in the church was placed in competition with him, a great majority of the electors decided in favour of this young orator, the choice of whom took place in July 1743.

In this station Dr. Blair, for eleven years, discharged with great fidelity the various duties of the pastoral office. His discourses from the pulpit in particular attracted universal admiration. They were composed with uncommon care; and, occupying a middle place between the dry metaphysical discussion of one class of preachers, and the loose incoherent declamation of another, they blended together, in the happiest manner, the light of argument with the warmth of exhortation, and exhibited captivating specimens of what had hitherto been rarely heard in Scotland, the polished, well-compacted, and regular didactic oration.

In consequence of a call from the town-council and general-session of Edinburgh, he was translated from the Canongate to Lady Yester's, one of the city churches, on the 11th of October, 1754; and on the 15th day of June, 1758, he was promoted to the High Church of Edinburgh. To this charge he was raised at the request of the lords of council and session, and of the other distinguished official characters who have their seats in that church. And the uniform prudence, ability, and success, which, for a period of more than forty years, accompanied all his ministerial labours in that conspicuous and difficult station, sufficiently evince the wisdom of their choice.

Hitherto his attention seems to have been devoted almost exclusively to the attainment of professional excellence; and to the regular discharge of his parochial duties. No production of his pen had yet been given to the world by himself, except two sermons preached on particular occasions, some translations, in verse, of passages of Scripture for the psalmody of the church, and a few articles in the *Edinburgh Review*; a publication begun in 1755, and conducted for a short time by some

of the ablest men in the kingdom. But standing as he now did at the head of his profession, and relieved by the labour of former years from the drudgery of weekly preparation for the pulpit, he began to think seriously on a plan for teaching to others that art which had contributed so much to the establishment of his own fame. With this view, he communicated to his friends a scheme of Lectures on Composition; and, having obtained the approbation of the university, he began to read them in the college on the 11th of December, 1759. To this undertaking he brought all the qualifications requisite for executing it well; and along with them a weight of reputation, which could not fail to give effect to the lessons he should deliver. For, besides the testimony given to his talents by his successive promotions in the church, the university of St. Andrew's, moved chiefly by the merit of his eloquence, had in June 1757 conferred on him the degree of D.D. a literary honour which, at that time, was very rare in Scotland. Accordingly his first Course of Lectures was well attended, and received with great applause. The patrons of the university, convinced that they would form a valuable addition to the system of education, agreed in the following summer to institute a rhetorical class, under his direction, as a permanent part of their academical establishment: and, on the 7th of April, 1762, his majesty was graciously pleased "To erect and endow a professorship of rhetoric and belles-lettres in the university of Edinburgh, and to appoint Dr. Blair, in consideration of his approved qualifications, regius professor thereof, with a salary of 70*l*." These Lectures he published in 1783, when he retired from the labours of the office; and the general voice of the public has pronounced them to be a most judicious, elegant, and comprehensive system of rules for forming the style and cultivating the taste of youth.

About the time in which he was occupied in laying the foundations of this useful institution, he had an opportunity of conferring another important obligation on the literary world, by the part which he acted in refusing from oblivion the poems of Ossian. It was by the solicitation of Dr. Blair and Mr. John Home that Mr. Macpherson was induced to publish his Fragments of Ancient Poetry; and their patronage was of essential service in procuring the subscription which enabled him to undertake his tour through the Highlands for collecting the materials of Fingal, and of those other delightful productions which bear the name of Ossian. To these productions Dr. Blair applied the test of genuine criticism, and soon after their publication gave an estimate of their merits in a dissertation, printed in 1763.

The great objects of his literary ambition being now attained, his talents were for many years consecrated solely to the important and peculiar employments of his station. It was not till the year 1777 that he could be induced to favour the world with a volume of the Sermons which had so long furnished instruction and delight to his own congregation. But this volume being well received, the public approbation encouraged him to proceed: three other volumes followed at different intervals; and all of them experienced a degree of success of which few publications can boast. They circulated rapidly and widely wherever the English tongue extends; they were soon translated into almost all the languages of Europe; and his present majesty, with that wise attention to the interests of religion and literature which distinguishes his reign, was graciously pleased to judge them worthy of a public reward. By a royal mandate to the exchequer in Scotland, dated July 25th, 1780, a pension of 200*l*. a-year was conferred on their author, which was continued till his death, which happened on the 27th of December 1800.

He left in the hands of the printer a fifth volume of Sermons, which, it seems, from the account of the Reverend Dr.

McLAYSON, who published them (together with the author's life from whence we draw this abridgment), were composed at very different periods of his life. They were however all written out anew in his own hand, and in many parts recomposed, during the course of the summer preceding his death, after he had completed his eighty-second year. The last of them which he composed, though not the last in the order adopted for publication, was the sermon on a Life of Diffipation and Pleasure—a sermon written with great dignity and eloquence, and which should be regarded as his solemn parting admonition to a class of men, whose conduct is highly important to the community, and whose reform and virtue he had long laboured most zealously to promote.

The sermons which he has given to the world are universally admitted to be *models in their kind*; and they will long remain durable monuments of the piety, genius, and sound judgment of their author. But they formed only a small part of his compositions in this way. These, however, sensible of the injury done to the fame of departed authors by the publication of their literary fragments, and too modest to attribute to them the degree of merit requisite for the press, he strictly forbade the publication of.

Dr. Blair, from a natural dislike to any situation which might expose him to the necessity of taking the smallest part in the contents of ecclesiastical politics, would never consent to become moderator of the general assembly of the church of Scotland. His opinions, however, were frequently resorted to; and the great reputation he had acquired in the discharge of his public duties, as well as the great respectability of his private character, always gave them considerable weight.

In April 1748, Dr. Blair married his cousin, Catharine, daughter of the Rev. James Bannaffine, one of the ministers of Edinburgh, by whom he had a son who died in his infancy, and a daughter, who lived to her 21st year. His domestic enjoyments were also fatally interrupted by the death of Mrs. Blair, which happened a few years before his own.

This inestimable man carried with him the truest regrets of all who knew him both in public and private life; a funeral sermon was preached at his burial, and the magistrates directed his church to be put in mourning.

BLAIR ATHOL, a village of Perthshire, in an angle formed by the rivers Tilt and Garry. Close by it is Blair Castle, a noble seat of the Duke of Athol's, on an eminence, amid a beautiful plain surrounded by hills, woods, and deep glens. In its vicinity are many fine waterfalls. Blair Athol is 28 miles N.W. of Perth. Long. 3. 41. W. Lat. 56. 46. N.

BLANCA, an uninhabited island to the N. of Margareta, near Terra Firma. Long. 64. 30. W. Lat. 41. 50. N.

BLANDA (anc. geog.), a Roman city in the territory of Barcelona in Hispania Citerior; now *Blanes*, a sea-port town of Catalonia, situated near the river Tordara. E. Long. 3. 40. N. lat. 41. 30.

BLANDONONA (anc. geog.), a small city of Liguria in Italy; now *Bron*, or *Broni*. See that article.

BLANES, a sea-port of Catalonia, in Spain, near the river Tordara, twenty miles S. of Gironne. Long. 2. 50. E. Lat. 41. 40. N.

BLEACHING (*Encycl.*). To the information already communicated on this important branch of the arts, we are induced to add, in the inventor's words, the following specification of the patent granted to Mr. Turnbull, junior, of Cordale Printfield, in Scotland, for certain new processes and apparatus applicable to the bleaching and purifying of cotton, flax, hemp, silk, and wool, or of mixtures of those materials, by which a considerable saving will be effected in fuel, alkali, &c. After the goods have been thoroughly washed, Mr. Turnbull says,

"When thus cleaned, they are put into a ley of vegetable or of mineral fixed alkali, or the volatile alkali, either mild or made caustic by quick-lime, or into a ley of quick-lime only, or into a soapy ley, or into a ley composed of all or any of these substances (with or without the addition of oxygenated muriatic acid), of a strength fit for the purpose of extracting the coloured or colourless gummy, resinous, or other impurities which may exist naturally in, or which may have been introduced (by accident or design) into the fibre or texture of the materials of goods under process, and which are too intimately united with them to admit of being removed by the first above-described washing or cleansing. The alkaline, soapy, or other ley, may be prepared by the method or methods usually followed by bleachers; my invention not consisting in the kind of alkaline leys, or other liquors employed, or in the way of preparing them, but in the mode of applying such alkaline, soapy, or other leys, and in the accompanying and subsequent manipulations; for, when the goods or articles to be bleached are immersed in the alkaline, soapy, or other ley or liquor, as before directed, instead of boiling or bucking them in it, as is the practice usually followed, I only steep them, or keep them long enough in the said ley to be thoroughly impregnated with it, which requires a shorter or longer time, according to the quantity and texture of the articles or goods. The goods are then drawn out of the rack over the vessel in which they were impregnated, and suffered to drain, that the superficially adhering ley or liquor may run from them back into the vessel. After this draining, the goods still hold a sufficient quantity of the ley or liquor employed to answer the end in view. They are then put into a vessel of sufficient strength and dimension, made of wood, stone, brick-work, earthen-ware, metal, or any proper material. This vessel, which I call a steaming-vat, may be almost of any form convenient for the premises or place where it is to be fixed, and is connected by means of a pipe, tube, hose, trunk, or hollow prism, made of wood, metal, or of any fit material, with a boiler, kettle, or cauldron, which I call the steaming-kettle, and which may be of any convenient form and dimensions. The tube above mentioned may pass from any part of the edge or of the side of the steaming-kettle, or even from its cover, which ought to fit steam-tight, into any part of the side or bottom of the steaming-vat, the intention and use of it being to convey steam from the aforesaid kettle to the aforesaid vat. The tube, pipe, hose, trunk, or hollow prism, is furnished with a stop-cock or valve, or any contrivance that will answer the purpose of shutting and opening at pleasure the communication between the said kettle and vat. The steaming-vat ought, for the convenience of lifting out the goods, to be furnished with a false bottom of some kind in the inside, as of wood or of net-work, for the goods to lie upon; and to this false bottom should be attached ropes, by means of which, and the assistance of a crane and pulley, or any other convenient mechanical power, the goods may be withdrawn from the vat after the operation of steaming them. The operation of steaming the goods is performed by opening the communication between the steaming-kettle and steaming-vat; the former, which contains some water or aqueous solution, being kept at a proper heat by means of a fire put under it, and the latter having previously its cover fitted on steam-tight. The steam is thus, as it were, pent up in the kettle and vat, and made to act with any pressure that may be desired, or that the strength of the vessels may be able to sustain. To secure the safety of the people employed, the apparatus ought always to be furnished with a safety-valve attached to any part of the steaming-kettle, or of the steaming-vat, or of the tube of communication, that when the elastic force of the enclosed steam reaches the determined point, the valve may open of itself,

and allow a portion of it to escape. By this process the goods can be heated considerably above the boiling point, a circumstance that adds so much to the dissolving power of the alkaline, or soapy, or other ley, that the quantity left in the goods, after draining, as before described, is found sufficient to dissolve and discharge, by one steaming, as much of the refinous, gummy, or other impurities, from the goods under process, as could have been discharged by a long boiling of the goods in the ley itself, as is the usual practice; and by this means a great saving is made in the alkalis or other ingredients employed for whitening the goods. For, in the common method, the colouring matter, as discharged from the fibre or texture of the goods, is diffused throughout the whole ley, which soon renders it so foul that it is obliged to be changed long before it has become saturated with the substances or matters on which it exercises its power. But by my process or processes there is no more ley employed for one steaming than what is sufficient merely to impregnate the goods thoroughly; and the alkali thus deposited in the texture or fibre of the goods under process is more or less disengaged from the said texture or fibre by the action of the steam, and is found at the bottom of the steaming-vat, of a dark colour, occasioned by the matters it has dissolved, and carried down with it. The steaming-vat may be very commodiously freed from this deposit by a common stop-cock, or even a plug at or near its bottom, to be opened as often as it may be necessary. I also effect the same end by using only a deep boiler, with a steam-tight cover, suspending the goods previously impregnated with the alkaline or other ley, as before directed, on frame or net-work, over boiling water, in the said boiler, and employing oxygenated muriatic acid, acidulated waters, mill washing, or exposure to the sun and air, when these are necessary: particular care must be taken to keep a supply of water, or some aqueous solution in the lower part of the boiler, below the frame or net-work on which the goods lie, or otherwise they may be singed, or actually burnt, and a loss be actually incurred. But I prefer putting the goods into steaming-vats, to putting them in a boiler, in the manner just described, and that on several accounts, but especially because, by means of one steaming-kettle, steam can be thrown into as many vats as can conveniently be ranged round it, which is a mean of making a considerable saving in the article of fuel. One steaming generally requires from four to eight hours, but the length of time will vary according to the kind or quality of the goods to be whitened, and the strength of the ley that has been employed for impregnating them. After the steaming has been continued a sufficient length of time, the cover of the steaming-vat is taken off. The communication with the steaming-kettle is cut off by means of the aforesaid cock or valve, provided for that purpose, and the goods are lifted out by means of a crane and pulley, or other fit mechanical power, as before mentioned. They are then well washed by milling, or by any of the processes followed by bleachers. After this they are again impregnated with ley, steamed, and then washed; and these manipulations are repeated in the manner that has already been described till the goods are brought to the required degree of whiteness and purity. The usual operations of steeping in acidulated waters, and exposure to the sun and air, or to the action of the oxygenated muriatic acid, in such stages of the process as the bleacher may think proper, may be employed with advantage in my method, as well as in the common and usual method of bleaching. I need hardly direct here, what every bleacher's own experience must point out to him, namely, that when acidulated waters, exposure to the sun and air, or the oxygenated muriatic acid, are to be employed after any steaming, the goods should first be washed. When silk, sheeps' wool, or goods containing sheeps'

wool or animal hair, or fur, of any kind, are wished to be cleaned, scoured, or whitened, by the above-described method, the ley employed ought to be much weaker than in the case of cotton, flax, or hemp, or of goods manufactured of these, or any of them; for a strong caustic ley would entirely destroy the former, and convert them into a saponaceous matter.

There has been discovered a method of preparing the oxygenated muriate of lime in a dry form, and applying it to the purposes of bleaching, or removing colours from cloth, cotton, &c.

Mr. Charles Tenant, of Darnley, near Glasgow, the patentee, having found that the oxygenated muriatic acid is capable of forming a compound with calcareous earth, and also with frontites, barytes, and magnesia, merely by bringing the oxygenated muriatic acid gas into contact with them either when in lumps or in a pulverised state, has very considerably improved upon his former discovery, namely, that these earths might be so impregnated when diffused in water, and might, in that state, be employed in bleaching.

Till the discovery of these processes, Mr. Tenant observes, pot-ash was used to serve the purpose now obtained by lime or the other earths; and its expence to the bleacher was very considerable. The bleaching liquor, indeed, when made with alkali, enabled the cotton-manufacturers to bring their goods to market in one-third of the time they formerly required, and also to carry on their business at all seasons of the year. Hence a more extensive trade was carried on by the manufacturers of cotton; but linen goods, requiring the liquor in a much more concentrated state, heretofore derived little or no benefit from the practice of bleaching by chemical means. By the introduction of lime, however, the liquor is made so cheap that linens are also bleached with it, and that so expeditiously, that the dealer can turn his stock over twice or thrice for once that he could when the practice prevailed of bleaching in the open air.

Mr. Tenant farther observes, that, by preparing the oxygenated muriates in the dry way, bleachers may be cheaply and conveniently supplied with it, and save much of the trouble and expence and hazard which attend the preparation of the bleaching liquor in the old way.

BLETERIE (John Philip René de la), born at Rennes, entered early into the congregation of the Oratory, and was there a distinguished professor. The order against wigs occasioned his quitting it; but he retained the friendship and esteem of his former brethren. He went to Paris, where his talents procured him a chair of eloquence in the College Royal, and a place in the Academy of Belles-Lettres. He published several works, which have been well received by the public. 1. *The Life of the Emperor Julian*, Paris, 1735, 1746, 12mo. a curious performance, well written, and distinguished at once by impartiality, precision, elegance, and judgment. 2. *The History of the Emperor Jovian, with Translations of some Works of the Emperor Julian*, Paris, 1748, two vols. 12mo. a book no less valuable than the former. 3. *A Translation of some Works of Tacitus*, Paris, 1755, two vols. 12mo. *The Manners of the Germans, and The Life of Agricola*, are the two pieces comprised in this version, which is equally elegant and faithful. Prefixed is a *Life of Tacitus*, which is also worthy of this writer, by the strength of its sentiments, and the animation of its style. 4. *Tiberius, or the six first Books of the Annals of Tacitus*, translated into French, Paris, 1768, three vols. 12mo. 5. Letters occasioned by the Account of Quietism given by M. Phelypeaux, 1733, 12mo. 6. *Some Dissertations in the Memoirs of the Academy of Belles-Lettres*. 7. *Most humble Remonstrances of M. de Montrempuis*. The Abbé de la Bletterie died at an advanced age, in 1772. He was a man of learning, attached to religion, and his morals did not belie his principles.

QUÆSTOR, see QUESTOR.

QUAGGA, or QUACHA. See BARR.

QUAIL, in zoology. See TETRAO.

Quails are to be taken by means of the call during their whole waking time, which lasts from April to August. The proper times for using the call are at sun-rising, at nine o'clock in the morning, at three in the afternoon, and at sun-set; for these are the natural times of the quail's calling. The notes of the cock and hen quail are very different; and the sportsman who expects to succeed in the taking them must be expert in both: for, when the cock calls, the answer is to be made in the hen's note; and, when the hen calls, the answer is to be made in the cock's. By this means they will come up to the person, so that he may, with great ease, throw the net over them and take them. If a cock quail be single, on hearing the hen's note he will immediately come; but if he has a hen already with him, he will not forsake her. Sometimes, though only one quail answers to the call, there will three or four come up; and then it is best to have patience, and not run to take up the first, but stay till they are all entangled, as they will soon be.

The quail is a neat cleanly bird, and will not run much into dirty or wet places: in dewy mornings, they will often fly instead of running to the call; and in this case, it is best to let them go over the net, if it so happens that they fly higher than its top; and the sportsman then changing sides, and calling again, the bird will come back, and then will probably be taken in the net.

The calls are to be made of a small leather purse, about two fingers wide, and four fingers long, and made in the shape of a pear; this is to be stuffed half full of horse-hair, and at the end of it is to be placed a small whistle, made of the bone of a rabbit's leg, or some such other bone: this is to be about two inches long, and the end formed like a flageolet, with a little soft wax. This is to be the end fastened into the purse; the other is to be closed up with the same wax, only that a hole is to be opened with a pin, to make it give a distinct and clear sound. To make this found, it is to be held full in the palm of the hand, with one of the fingers placed over the top of the wax; then the purse is to be pressed, and the finger is to shake over the middle of it, to modulate the sound it gives into a sort of shake. This is the most useful call; for it imitates the note of the hen quail, and seldom fails to bring a cock to the net if there be one near the place.

The call that imitates the note of the cock, and is used to bring the hen to him, is to be about four inches long, and above an inch thick; it is to be made of a piece of wire turned round and curled, and covered with leather; and one end of it must be closed up with a piece of flat wood, about the middle of which there must be a small thread or strap of leather, and at the other end is to be placed the same sort of pipe, made of bone, as is used in the other call. The noise is made by opening and closing the spiral, and gives the same found that the cock does when he gives the hen a signal that he is near her.

QUAKERS, a religious society which took its rise in England about the middle of the seventeenth century; spread rapidly there, and found its way into some other countries of Europe, and into the English settlements in North America. The first preacher was George Fox, an illiterate person, who made his first appearance in that character about the year 1648. The nation was then greatly agitated by religious controversies. Fox acquired several followers, and in the year 1650, being brought before two justices in Derby, for having interrupted a minister in the exercise of his function, one of them by way of jeer gave this people the name of *Quakers*; an appellation which has stuck to them ever since; though they themselves adopted, and still retain, the name of *Friends*.

Robert Barclay and William Penn are two of the principal writers of this society. The former wrote a masterly apology

VOL. VIII.

for their doctrines, to which he prefixed a remarkable address to King Charles II. Penn wrote several books, the chief of which that entitled, *No Cross, no Crown*, shewing that the way to obtain the heavenly crown is by being willing to bear the cross.

These were writers of considerable learning and abilities, to whom may be added Sewell, the historian, who wrote an account of this people, first in Dutch, and afterwards in English. It may also be proper to mention, of later time, Anthony Pruver, who having been brought up (like Fox) in the employment of a shepherd, and a shoemaker, afterwards acquired so much knowledge in the dead languages, as to translate the whole of the Scriptures into English. It must be admitted, however, that the quakers, as a body, have produced few learned or scientific authors; and this reason may be assigned, that they avoid sending their children to public schools, and train them principally to mechanical or commercial employments, preferring the useful to the ornamental in their education. In medicine, nevertheless, the only learned profession which is open to them in Great Britain, they have had many who have attained and adorned the degree of doctor, among whom the learned world will readily recognize the name of Fothergill.

It is somewhat difficult to give an accurate account of their tenets, as they have no standard confession of faith. They have however, so lately as 1790, published a summary view of their doctrines: from which we learn, in brief, that the Friends believe in one eternal God, and in Jesus Christ, his Son, the Messiah and Mediator of the new covenant. They acknowledge the divinity of Christ, who is the wisdom and power of God unto salvation. To Christ alone they give the title of the *word of God*, and not to the Scriptures, but they highly esteem those sacred writings, in subordination to the spirit, from which they were given forth. They believe that, in order to enable men to put in practice the most excellent precepts of the gospel, every man is endued with a measure of the light, grace, or good spirit, of Christ, by which he is enabled to distinguish good from evil, and to correct those corrupt propensities of his nature which mere reason is insufficient to overcome. They believe that the influence of the spirit of Christ is necessary to enable them acceptably to worship; and that to wait for it, when met, in silence, is their proper business. They ascribe all true ministry to the same source, the immediate influence of the Holy Spirit. They reject, or disuse, baptism with water and the supper: the former as pertaining, according to John the Baptist's avowal, to a decreasing dispensation, and having been merely typical of spiritual baptism: the latter rite they do not consider as maintaining communion between Christ and his church; which is only obtained by a real participation of his divine nature through faith. As this society lays so much stress on the inward persuasion of the mind, effected by the operation of the light of Christ; and as they believe that lively faith is not at man's command, but is the gift of God in Christ, although nourished by man's obedience to its discoveries; they are so far from requiring of such as request admission among them, or such as are employed in the service of their church, any of those articles or formulas of faith, which are too often the means of inducing an insincere compliance, that they make no use of such forms at all. They say, in their summary, "We prefer the judging of men by their fruits, and depending on the aid of him who, by his prophet, hath promised to be a spirit of judgment to him that sitteth in judgment. Without this, there is a danger of receiving numbers into outward communion, without any addition to that spiritual fellowship, whereof our blessed Lord hath declared himself to be both the door and the shepherd—that is, of such as know his voice, and follow him in the paths of obedience."

BLIND (*Encycl.*). By way of illustrating what has been already said under this article, we shall add one or two very singular histories; and shall begin with an account of some remarkable particulars that happened to a lady after having had the confluent small-pox. "In the course of this disease the lady was attended by the late Sir Hans Sloane, and several threatening symptoms appeared, which, however, were at length overcome; and the patient was thought out of danger. She was attacked afterwards with dreadful spasms, to remove or mitigate which many remedies were tried; and, among others, the cold bath: but either by the natural effect of the bath, or by some mismanagement in the bathing, the unhappy patient first became *blind*, and soon afterwards deaf and dumb. It is not easy to conceive what could increase the misery of deafness, dumbness, blindness, and frequent paroxysms of excruciating pain: yet a very considerable aggravation was added; for the loss of her sight, her hearing, and her speech, was followed by such a fricture of the muscles of her throat, that she could not swallow any kind of aliment either solid or liquid. It might reasonably be supposed that this circumstance, though it added to the degree of her misery, would have shortened its duration: yet in this condition she continued near three quarters of a year; and during that time was supported in a very uncommon manner, by chewing her food only; which having turned often, and kept long in her mouth, she was obliged at last to spit out. Liquors were likewise gargled about in her mouth for some time; and then returned in the same manner, no part of them having passed the throat by an act of deglutition: so that whatever was conveyed into the stomach, either of the juices of the solid food, or of liquids, was either gradually imbibed by the sponginess of the parts, which they moistened, or trickled down in a very small quantity along the sides of the vessels.

But there were other peculiarities in the case of this lady yet more extraordinary. During the privation of her *sight* and *hearing*, her *touch* and her *smell* became so exquisite, that she could distinguish the different colours of silk and flowers, and was sensible when any stranger was in the room with her.

After she became blind, and deaf, and dumb, it was not easy to contrive any method by which a question could be asked her, and an answer received. This, however, was at last effected by talking with the fingers, at which she was uncommonly ready. But those who conversed with her in this manner, were obliged to express themselves by touching her hand and fingers instead of their own.

A lady who was nearly related to her, having an apron on, that was embroidered with silk of different colours, asked her, in the manner which has been described, if she could tell what colour it was? and after applying her fingers attentively to the figures of the embroidery, she replied, that it was red, and blue, and green; which was true. The same lady having a pink coloured ribbon on her head, and being willing still further to satisfy her curiosity and her doubts, asked what colour that was? her cousin, after feeling some time, answered that it was pink colour: this answer was yet more astonishing, because it shewed not only a power of distinguishing different colours, but different kinds of the same colour; the ribbon was not only discovered to be red, but the red was discovered to be of the pale kind called a *pink*.

This unhappy lady, conscious of her own uncommon infirmities, was extremely unwilling to be seen by strangers, and therefore generally retired to her chamber, where none but those of the family were likely to come. The same relation, who had by the experiment of the apron and ribbon discovered the exquisite sensibility of her *touch*, was soon after convinced, by an accident, that her power of smelling was acute and refined in the same astonishing degree.

Being one day visiting the family, she went up to her cousin's chamber, and after making herself known, she intreated her to go down, and sit with her among the rest of the family, assuring her that there was no other person present: to this she at length consented, and went down to the parlour door; but the moment the door was opened she turned back, and retired to her own chamber much displeased; alleging, that there were strangers in the room, and that an attempt had been made to deceive her: it happened indeed that there were strangers in the room; but they had come in while the lady was above stairs, so that she did not know they were there. When she had satisfied her cousin of this particular she was pacified; and being afterwards asked how she knew there were strangers in the room, she answered, by the smell.

But though she could by this sense distinguish in general between persons with whom she was well acquainted, and strangers, yet she could not so easily distinguish one of her acquaintance from another without other assistance. She generally distinguished her friends by feeling their hands; and when they came in, they used to present their hands to her, as a mean of making themselves known: the make and warmth of the hand produced in general the differences that she distinguished; but sometimes she used to span the wrist, and measure the fingers. A lady, with whom she was very well acquainted, coming in one hot day, after having walked a mile, presented her hand as usual; she felt it longer than ordinary, and seemed to doubt whose it was; but after spanning the wrist, and measuring the fingers, she said, 'It is Mrs. M. but she is warmer to-day than ever I felt her before.'

To amuse herself in the mournful and perpetual solitude and darkness to which her disorder had reduced her, she used to work much at her needle; and it is remarkable, that her needle-work was uncommonly neat and exact: among many other pieces of her work that are preserved in the family is a pin-cushion, which can scarce be equalled. She used also sometimes to write; and her writing was yet more extraordinary than her needle-work: it was executed with the same regularity and exactness; the character was very pretty, the lines were all even, and the letters placed at equal distances from each other: but the most astonishing particular of all, with respect to her writing, is, that she could by some means discover when a letter had by some mistake been omitted, and would place it over that part of the word where it should have been inserted, with a caret under it. It was her custom to sit up in bed at any hour of the night, either to write or to work, when her pain or any other cause kept her awake.

These circumstances were so very extraordinary, that it was long doubted whether she had not some faint remains both of hearing and sight, and many experiments were made to ascertain the matter; some of these experiments she accidentally discovered, and the discovery always threw her into violent convulsions. The thought of being suspected of insincerity, or supposed capable of acting so wicked a part as to feign infirmities that were not inflicted, was an addition to her misery which she could not bear, and which never failed to produce an agony of mind not less visible than those of her body. A clergyman who found her one evening at work by a table with a candle upon it, put his hat between her eyes and the candle, in such a manner that it was impossible she could receive any benefit from the light of it if she had not been blind. She continued still at her work with great tranquillity; till, putting up her hand suddenly to rub her forehead, she struck it against the hat, and discovered what was doing; upon which she was thrown into violent convulsions, and was not without great difficulty recovered. The family were, by these experiments, and by several accidental

circumstances, fully convinced that she was totally deaf and blind; particularly by sitting unconcerned at her work, during a dreadful storm of thunder and lightning, though she was then facing the window, and always used to be much terrified in such circumstances. But Sir Hans Sloane, her physician, being still doubtful of the truth of facts which were scarce less than miraculous, he was permitted to satisfy himself by such experiments and observations as he thought proper; the issue of which was, that he pronounced her to be absolutely deaf and blind.

She was at length sent to Bath, where she was in some measure relieved; her convulsions being less frequent, and her pains less acute: but she never recovered her speech, her sight, or her hearing, in the least degree.

Many of the letters dated at Bath, in some of which there are instances of interlineations with a caret, the writer of this narrative hath seen; and they are now in the custody of the widow of one of her brothers, who, with many other persons, can support the facts here related, however wonderful, with such evidence as it would not only be injustice, but folly to disbelieve.

In the Annual Register for 1762, we have the following account of a French lady, blind from her infancy, who could read; write, and play at cards, &c. A young gentleman of a good family in France, then in her eighteenth year, lost her sight when only two years old, her mother having been advised to lay some pigeon's blood on her eyes to preserve them in the small-pox; whereas, so far from answering the end, it injured them. Nature, however, may be said to have compensated for this unhappy mistake, by the beauty of her person, sweetness of temper, vivacity of genius, quickness of conception, and many talents which certainly much alleviated her misfortune. The narrative continues thus:

"She plays at cards with the same readiness as others of the party. She first prepares the packs allotted to her, by pricking them in several parts; yet so imperceptibly, that the clearest inspection can scarce discern her indexes. She sorts the suits, and arranges the cards in their proper sequence, with the same precision, and nearly the same facility, as they who have their sight. All she requires of those who play with her is, to name every card as it is played; and these she retains so exactly, that she frequently performs some notable strokes such as shew a great combination and strong memory.

"The most wonderful circumstance is, that she should have learned to read and write; but even this is readily believed on knowing her method. In writing to her, no ink is used, but the letters are pricked down on the paper; and by the delicacy of her touch, feeling each letter, she follows them successively, and reads every word with her fingers' ends. She herself in writing makes use of a pencil, as she could not know when her pen was dry; her guide on the paper is a small thin ruler and of the breadth of her writing. On finishing a letter, she wets it, so as to fix the traces of her pencil, that they are not obliterated or effaced; then proceeds to fold and seal it, and write the direction: all by her own address, and without the assistance of any other person. Her writing is very straight, well cut, and the spelling no less correct. To reach this singular mechanism, the indefatigable cares of her affectionate mother were long employed, who accustomed her daughter to feel letters cut in cards or paste-board, brought her to distinguish an A from a B, and thus the whole alphabet, and after-

wards to spell words; then, by the remembrance of the shape of the letters, to delineate them on paper; and, lastly, to arrange them so as to form words and sentences.

"She has learned to play on the guitar, and has even contrived a way of pricking down the tunes as an assistance to her memory. So delicate are her organs, that in fingering a tune, though new to her, she is able to name the notes.

"In figured dances she acquires herself extremely well, and in a minute with inimitable ease and gracefulness. As for the works of her sex, she has a masterly hand; she sews and hems perfectly well; and in all her works she threads the needles for herself however small.

"By the watch her touch never fails telling her exactly the hour and minute."

From this account, however, it would appear, that, except reading and writing, the French lady has nothing to boast of in which she is not excelled by Mr. Stanley already mentioned, if we may credit all that is reported of him. The works peculiar to her sex are gained mechanically; but the *distinguishing colours*, telling the precise time by a watch, naming the notes in music, and many other things depending upon the ear and touch, are said to have been so familiar to him, that his friends cease to think them extraordinary. Attainments still more wonderful are ascribed to him; as, the naming the number of persons in a room on entering it; the directing his voice to each person in particular, even to strangers when they have once spoken; the missing any person absent, and telling who that person is; and lastly, his being able to form just conceptions of youth, beauty, symmetry, and shape.

To the foregoing particulars, which abundantly demonstrate what the blind, even when self-instructed, are capable of, we shall now add a cursory account of some of the public institutions set on foot in this country for their benefit, the methods practised there, and the degree of success which has attended them, as far as we have had the means of ascertaining the facts from printed documents which accident has thrown in our way. These, however short of the fullest information to be obtained, are at least sufficient to countenance any attempt to render general, throughout the united kingdom, similar institutions for the benefit of the most forlorn of our species. England seems to have been indebted to her late enemy and republican neighbour in this, as in some other material instances, for the example of schools for the blind*. The first established in Britain was undertaken at Liverpool, at the suggestion and under the management of a benevolent clergyman there, who, in his public communications on the subject, evinced an obvious design to imitate the French school, which had then been for some time established, and given public proofs of success. This institution was called the "*Asylum for the Blind*," and was, for near ten years, carried on in two very small adjoining houses, situated in an airy part of the town. Except one room, in which the manufactured goods were exposed to sale, and the apartments necessary for the superintendent and his wife, the rest of the premises were occupied with blind pupils, who pursued their several employments during the stated hours for work, and were allowed proper intervals for going home to their meals, and for relaxation. Their attendance was only *during the day*, as they were neither lodged nor boarded; nor were they received, unless the parishes to which they belonged (or their

* The following fact, however, will shew the possibility of the French having borrowed the *hint* from ourselves. The Rev. Dr. David Johnston, of Leith, describing the state of the school for the blind at Edinburgh, writes thus to a gentleman in London in 1801:—"I have seen a plan of the same kind," says he, "which was formed in your city (London) *thirty years ago*, and the first people in the kingdom seemed to have countenanced it, but how it miscarried I cannot tell."

friends, if able) contributed something weekly towards their maintenance. With this allowance, the amount of their earnings, and a small additional weekly payment from the institution, they were supported till they became sufficiently expert in their business to leave the asylum and maintain themselves, which the greater part of them have been enabled to do very decently. The average number of scholars from the commencement of the institution in December 1799 is about forty-five. The following extract from the committee's report, will shew at once the articles they manufactured, and the amount of the sales in the four successive years.

	1797	1798	1799	1800
	£. s. d.	£. s. d.	£. s. d.	£. s. d.
Whips	92 16 10	33 6 0	18 6 6	5 5 0
White rope mats	2 5 0	7 14 2	11 18 9	4 3 4½

Worsted stockings	0 0 0	0 0 0	3 10 11	1 2 8

The same system is now pursued in a new building purposely erected for the accommodation of the pupils (see Pl. 18.) near the infirmary. — It was first opened in the year 1800, to about sixty scholars of both sexes, and of indiscriminate ages; and arrangements are now preparing for the boarding and lodging of some, whose poverty and want of friends to assist them distinguish them particularly as objects of charity.

This laudable example was soon followed by the inhabitants of Bristol, at which place a school for the blind, upon a small scale, has been successfully carried on for several years; the particulars of this need not be detailed, since the plan and good effects so nearly resemble those of its prototype.

In the Edinburgh institution, which is professedly calculated "for the relief of the indigent blind," the employments of the pupils are these:

They work four looms in the manufacture of a kind of callico, which they call "Glasgow blane." A superintendent, who is a regular workman, constantly attends to rectify the mistakes of those who are not yet perfect in this business. Upon an average each person weaves four ells per day, for which two pence per yard is paid by the proprietors of the goods. Boys are also employed in picking and untwisting old junk, which is afterwards made into door-mats; some tease horse-hair, which is used for the stuffing of mattresses or chair bottoms, others card wool with the carding-machine; some are employed in the manufacture of fishing-nets—an art which they practise very readily, merely with their fingers and a needle, no bar being employed to square the meshes. It is somewhat curious that even those who, previous to their becoming blind, were in the habit of netting with a bar, and could not work without one, afterwards have found it an obstacle. So accurate is their sense of touch, that one of them pointed out the irregularity of some meshes made by a bystander, and detected some imperfect knots, which he dexterously untied before he resumed his work. Their cabbage-nets are made by first working a square piece, then bringing the selvages together, and afterwards fastening the ends. All kinds of wicker-work are made; and when the twigs intended to be wrought are of different colours, the workman makes the distinction by keeping one kind on the right, the other on the left hand.

In the summer season the pupils begin their work at seven in the morning, and quit it at the same hour in the evening; in winter they begin at eight and quit at six. They breakfast at nine, and dine at two o'clock, and are allowed one hour for each meal. Their food is provided by themselves at their own homes, care being taken to fix their habitations as near as possible to the school—an arrangement which, in a town like Edinburgh, is not by any means difficult. Those who have no families, or live at a distance, bring their provisions for dinner with them, so that they only have to come in the morning and return in the evening. Many find the way without assistance; others are conducted by one of their children or friends, so that little of their time is lost. With a view of gratifying the curiosity of the inhabitants, and thereby inducing farther contributions, they have four public dinners in the year. The highest wages paid by the institution is six shillings per week, the lowest three and sixpence: this, however, does not so much depend on the quality or quantity of work they may perform, but on their domestic or personal exigencies; for a man shall receive six shillings a-week whose earnings may not amount, probably, to more than half that sum.

Besides the articles already mentioned, they manufacture a strong cloth for stairs and passages, which is sold for 3s. 6d. a-yard. They also make various kinds of mattresses for sale; and in the execution of these works, if the overseer, who is an intelligent man, is not able to instruct them, proper masters attend to give their assistance. Great attention, indeed, is found necessary in the different departments, to rectify any little mistakes, to keep good order, and induce the pupils to pay a diligent attention to their work: on this, indeed, in a great measure, does the happiness of these unfortunate persons depend; it is this that guards them from *ennui*, and at night they are seen returning to their houses with cheerful countenances.

The profits on their collective labours probably do not amount to more than 50*l.* annually, whereas about 250*l.* is distributed among them every year, the deficiency being made up by the funds of the institution.

We have heard of similar plans carrying on in some other towns in England, and also of one in Dublin; but as the sketches already given convey a sufficient idea of the nature of these undertakings, to enter into a minute description of them would only be useless repetition. The only school for the blind, therefore, on which it is farther necessary for us to dwell, as having some distinguishing features in its plan and extent, is that established in 1799, in the neighbourhood of London.

This institution, like that of Liverpool, owes its existence to the exertions of a single individual, who, relying on that benevolence and public spirit which on all occasions has distinguished the inhabitants of the British metropolis, brought a host of friends to the undertaking by the simple act of circulating, at his own expence, a few printed copies of an address tending to demonstrate, by the example of the Liverpool asylum, the importance and utility of such an institution in a place where the number of blind persons could not but be considerable, where their poverty and depravity rendered them doubly the objects of commiseration, and where the means of instruction and future employment were even more attainable than in remoter situations.

The plan of the London "School for the indigent Blind," embraces two distinct objects:—

1. To provide a place of permanent residence and instruction for those whose peculiar situation demands it, till they shall have learned what may be necessary for their future support.

2. To establishing, in various parts of the metropolis, day-schools to which the blind may resort for instruction.

The former of these only have been carried into effect, though steps are now taking to accomplish the latter; and it is intended to make the important and novel addition of a *cheap dinner* for such as *choose* to partake of it at the school; instead of going home and returning again to work, the inconvenience of which, to a blind person, in a crowded and busy metropolis, must be obvious.

The principal school (which also serves as a *day-school* to the neighbourhood) is situated in St. George's Fields, and contains, at present, twenty boys and ten girls; a preference having been given to those between thirteen and eighteen years of age, partly because their organs are more flexible at that early period of life, and partly because their term of existence has been little abridged. They are instructed, by proper teachers, in such manufactures as are found to answer best in other institutions of the same description; the chief are, basket-making, spinning, netting, the manufacture of fashion, clothes-line, clock-line, and of woollen-lift slippers.* The pupils are not confined to one single employment, but instructed in several, that they may have the better chance of maintaining themselves, at least with some little assistance from their parishes or friends, in one or other of them. Whilst some few are incapable of being taught, and are therefore dismissed, the occasional ingenuity displayed by others is exceedingly striking: there is now in the school a girl who threads a *fine* needle, by the assistance of her tongue, with the greatest readiness. Nor is this, though it demonstrates how accurate the remaining senses become in blind persons, an unusual accomplishment with them; two women, at the Liverpool school do the same thing, and one of them *cuts out* and *makes* her own caps and body linen, with a degree of perfection, and even neatness, that is truly surprising. The committee of the London school have relaxed (we think improperly) from the practice so beneficially exercised at Liverpool, of requiring some pecuniary aid from the *friends* of the pupils, only demanding a weekly payment from the *parishes*. We condemn only the *unifform* exercise of this ill-directed humanity, many of the friends of such objects being abundantly able, and even willing, to contribute to an expense which would, without the assistance of the charity, be wholly their own, and without any prospect of its termination; whilst the *entirely* *disburthening* the parents, instead of assisting them, in an *exact* *proportion* to *their efforts* to *assist themselves*, weakens that motive for exertion which is the life-spring of industry, of morality, and of happiness to the poor.

It is not the object of these remarks to cast any censure on the way in which these or other institutions for the same laudable purpose are supported or conducted; they are, undoubtedly, entitled to every degree of praise, and every possible assistance from the wealthy and benevolent; they demonstrate that human ingenuity may be made to triumph, in a variety of ways, over the most considerable of human privations; and that beggary and want, though they may be eventually, are not necessarily, the lot of the indigent blind. In search of principles, however, we may be allowed some freedom of remark; and, therefore, the following conclusions, supported at once by theory and experience, may be hazarded for the advantage of those who may attempt to form

schools for the blind, in parts of the country where they do not now exist.

This subject seems to demand the following considerations:

1. What are the most attainable and profitable trades or employments for the blind?

2. How is the instruction to be afforded them in the cheapest manner?

3. As they cannot be supposed in any instance capable of earning so much as those who have the benefit of sight, are there any means of rendering the produce of their labour equal to their subsistence?

On the first of these subjects we may observe, that many of the employments which have been chosen for the blind, though the result of circumstances, and apparently the best that their local situation admits of, are nevertheless better calculated to display their ingenuity, than to enable them speedily and effectually to provide for themselves.

The manufacture of some one article of general consumption, a knowledge of which is easily acquired by the pupil, which requires neither capital nor cumbrous machinery, and which will afford the workman a livelihood, are undoubtedly the objects to be attended to in these institutions. It may not, perhaps, in all cases, be expedient to qualify the blind man for a venter of his own wares; and in that case he may either manufacture the goods of his employer at home, or work out of doors on weekly wages, at trades which require the aid of machinery.

With regard to the second object of enquiry, it is of the utmost importance to avoid the expences of an establishment which, in general, are so considerable, as to leave the objects intended to be relieved a very scanty share of that which should be, if possible, wholly and exclusively applied to their advantage. Where a regular building is thought absolutely necessary, the plan of the school at Liverpool (see Pl. 18.) may very properly be adopted. There are some few institutions, however, conducted on more economical principles, and there is no doubt but one of that nature might easily be established in every considerable town. There would be no difficulty, for instance, in setting up a basket-maker, who should vend no other goods than those manufactured by blind persons *instructed by himself* on the recommendation of the inhabitants. His pupils, whilst learning their business, should attend to work in his shop till they became sufficiently perfect in their business to be entrusted with materials to work at their own homes, and for which they should then receive a fair remuneration when the goods were delivered. The only expence which the supporters of such a plan would have to sustain, would be the rent of an outhouse for the workshop, the price of a few twigs which would be spoiled by beginners, and an adequate salary to the master, who would, no doubt, derive farther encouragement by almost exclusively supplying the town with his goods at the usual profit.

With regard to the third enquiry, as to the means of rendering the little which the blind are capable of earning *adequate to their subsistence* (without which the object we have in view is, in fact, only half accomplished), it may be observed, that whilst it can be demonstrated, that a *penny* or *three halfpence per day* is sufficient, even in these dear times,

* As the manufactures which the blind are capable of conducting *entirely and without assistance*, and in their own confined dwellings, are very limited, the committee of the London school have given some consideration to the following question proposed to them, viz. *May not many of the simpler mechanic exercises, now too complex for the touch alone, be aided by machinery*, as is the case with the manufacture of horse-whips? It is even proposed to offer *premiums* to the ingenious for the discovery of means of this sort, which may lead to the most important consequences in the instruction of the blind, in these humane and highly useful seminaries throughout the country.

to provide a poor man with a *wholesome and nutritious dinner*, there can be no difficulty in this part of the undertaking. All that is necessary on this head may be found in the first volume of Reports of the Society, established in London, for increasing the Comforts and bettering the Condition of the Poor. The information in their account of a *cheap dinner* supplied for seventy-seven labouring children at Epping, is well worth the attention of those who propose to add to the number of these excellent seminaries. At the Liverpool school, and in some other institutions for procuring the means of subsistence to the blind, music has been taught—a heavenly science, and one in the practice of which the blind have been long known to make great attainments. It is this notoriety which has occasioned its omission in the foregoing remarks. Indeed, as it demands a long and persevering application on the part both of pupil and teacher, before the former is capable of practising it for a livelihood, it did not enter into the system here recommended, which has in view means of more extensive utility. There is no doubt, however, that a few of these unfortunate persons in every place might, with great propriety, be taught music, and fill the situation of organists in all our churches, to which even an indifferent player is known to be competent. It should by no means be forgotten, when the means of a livelihood are furnished for the blind, peremptorily to interdict their remaining idle, or becoming street beggars, or contributing to vice and immorality by fiddling in ale-houses. In great towns, the temptation to mendicancy is particularly strong, since more is to be gotten by standing at the corner of a street for two hours than perhaps can be procured by the industry of twenty-four. Those charitable persons, however, who really wish the happiness of the indigent blind, or indeed the poor of any other description, will *conscientiously withhold the wages of idleness*, and direct their bounty to flow in a more indisputable though circuitous course, namely, through the hands of those who will not fail to apply it judiciously and with effect.

BLOCKLEY, a village of Worcestershire, though inclosed by Gloucestershire, seven miles S.E. of Evesham. Long. 1. 53. W. Lat. 52. 0. N.

BLYTHBOROUGH, a decayed town in Suffolk, on the river Blyth. It has a stately church, and is 98 miles N.E. of London. Long. 1. 40. E. Lat. 52. 26. N.

BOAT (*Encycl.*). M. Bernieres invented a boat which is not liable to be overlet or sunk. Some trials were made with this vessel at Paris, in the year 1777, in the presence of a vast concourse of spectators. Eight men went into the boat, and rowed it till it filled with water, and afterwards towed it along the river in that state, without danger of sinking. M. Bernieres then ordered a mast to be erected in the same boat, when filled with water, and hauled down by a rope fastened to the top of the mast till it touched the surface of the river, so that the vessel heeled in a position to which neither winds nor waves could bring her; yet as soon as the rope was let go, the boat recovered her equipoise in less than a second. This experiment proved that the boat could neither be sunk nor overturned, and that it afforded the greatest possible security against accidents. Hence this invention is of the first importance to the inhabitants of maritime states.

In the year 1785, a patent was granted to Mr. Lukin for his improvement in the construction of boats and small vessels, so that they will neither overlet nor sink. This useful invention is described in the specification of the patent as follows: To the outides of boats and vessels, of the common or any other form, are projecting gunwales, sloping from the top of the common gunwale, in a feint curve, towards the water, so as not to interrupt the oars in rowing; and, from the extreme projection (which may be greater or less, accord-

ing to the size and use the boat or vessel is intended for), returning to the side in a slight curve, at a proper distance above the water-line. These projecting gunwales may be made solid, of any light materials, that will repel the water, or hollow and water-tight, or of cork, and covered with thin wood, canvas, leather, tin, or any other light metal, mixture, or composition. These projections are very small at the stem and stern, and increase gradually to the dimensions required; they will effectually prevent the boat or vessel from being overlet by sudden squalls, or violent gales of wind, either in failing or rowing, or by imprudent or unskillful management. In the inside, at the stem and stern, and at the sides (where the projecting gunwales are not necessary), and under the seats and thwarts, are inclosures or bulk-heads, made water-tight, or filled with cork, or other light materials that will repel the water: the spaces between the timbers may in like manner be filled up. By this means the boat or vessel will be so much lighter than the body of water it must displace in sinking, that it will with safety carry more than its common burthen, though the remaining space should by any accident be filled with water. Under the bottom, along the centre of the keel, is affixed a false one of cast-iron, or other metal; this will strengthen and protect the bottom from injury in many cases; and, by being placed so much below the surface of the water, will act as ballast with more power than a much greater weight in the common situation, and is much more safe, by being fixed in the proper place, and not liable to shift by any sudden motion of the boat or vessel.

Ice-Boat, a modern invention of Thomas Ritzler, of Hamburg, whose name deserves to be transmitted to posterity; as his ingenious and useful contrivance has already saved many valuable lives from a watery grave. We have given an accurate representation of such a boat in the annexed plate, and shall here furnish the reader with the description.

Fig. 1. Pl. 17. is a perspective view of the boat, the body of which consists of wicker-work covered with leather, to render it impermeable by water; and so remarkably light, that it may be easily managed by one person both on the ice and in the water. Its length, when measured on the outside, is $7\frac{1}{2}$ feet in the keel, and 12 feet above from end to end: its breadth 3 feet at the bottom, and 4 at the upper part.

Fig. 2. represents the plan of the boat, the bottom of which is shod with two small pieces of iron, marked *x*, *x*; by means of two hooks, one of which is delineated on the plate, the boat may with the greatest facility be slid over the ice. In the lower part, or body of the vessel, there is a large opening, 3 feet long and 15 inches wide, pointed out by *o*, *o*, *o*, fig. 2.; and *o*, fig. 3.; the four sides of which are secured by a frame-work, marked *r*, fig. 1. and 3. to prevent the water from entering the vessel. Through this opening, also, the boatman is enabled to step upon the ice in those places where it is too uneven to admit the sliding of the boat, and to carry it, by means of the handles, as represented in fig. 1. where the person standing is marked only with dotted lines, to shew that he has quitted his former station in the boat. Another advantage derived from this aperture, in the middle of the boat, is the counterpoise which a column of water in its centre produces, and thus prevents it from being overlet, while the man who carried it over the ice immediately raises himself above the level of the water, and fits down in the vessel. But, in order to approach nearer to the person whose life is endangered, there is also employed a ladder with a long jointed handle, which is pushed forward and held by another assistant standing on the firm ice. On this ladder (which will be delineated among the implements of restoration from drowning) the boatman places himself, and advances as near as possible to

the body immersed in the water. Having successfully extracted it, no time should be lost in laying it in a proper posture in the boat; for which purpose there is a kind of chair with an elevated back, on the stern of the boat, marked *n*, in fig. 1. and 3.; which last exhibits the longitudinal section of the vessel.

M. Gunther, one of the most active members of the Hamburg Society for the Encouragement of the Arts and useful Trades, informs us in the third volume of their Transactions, published in 1795, that he has often been present when unfortunate persons have been rescued from untimely death, by means of the ice-boat, and that the swiftness and dexterity with which this machine may be managed by expert assistants, is almost incredible. Hence the vessel is not intrusted to any other but skilful hands, and during summer it is deposited in an airy place, and the leather preserved from becoming either too dry or mouldy. The whole of this useful apparatus costs only 150 marks currency, or about 10*l*. sterling; a sum so insignificant, that, while the city of Hamburg has built five such ice-boats, the great city of London ought to be in possession of at least one hundred.

Life-Boat, at Shields, one of the most useful modern inventions, by which many lives and much property have already been saved. It was built by Mr. Greathcad, an eminent ship-builder, and generously presented to the inhabitants of South Shields by the present Duke of Northumberland, by whose beneficence North Shields has also been supplied with a boat of a similar construction.

Mr. Fairclough, who furnished some useful hints respecting the original plan, describes the vessel as measuring thirty feet by ten, resembling in form a common Greenland boat, but more flat in the bottom. The quantity of cork employed in the construction is about seven hundred weight, with which the boat is lined inside as well as outside of the gunwales, two feet in breadth; the seats being also filled with the same material. It is rowed by ten men, double banked, and steered by one at each end with oars, being alike in its form at both ends, and contrived so as not to sink in the sand.

This boat draws very little water, and can carry twenty persons even when full of water. Being water-proof, and rendered buoyant by cork, it always keeps afloat, preserving its equilibrium without danger of upsetting, and is able to contend against the most tremendous sea, having never failed, in a single instance, of conveying a distressed ship's crew in safety.

When taken out in the highest seas and broken water, the men testify no apprehension; and though cork-jackets were at first provided for them, yet their confidence in the boat is so great that they now refuse them.

A model of this useful boat is kept at Northumberland-house in the Strand. It might be improved, by providing it with wheels, for its more ready conveyance to the place where it is immediately wanted.

The vessel, when complete and copper-nailed, costs about 15*0*l**.—But in the moment of distress, what shipwrecked mariner would not think this article a cheap purchase, and pronounce the value of such a boat to be truly inestimable?

A patent has lately been granted to Mr. Edward Seers, of the Inner Temple, for a machine to be applied to boats and other vessels, for the purpose of moving them with ease and swiftness. This invention consists of two or more paddles, moving by means of machinery, in contrary and alternate directions. The paddles are so constructed, that when the machinery is set in motion, the broad surface of one or more of them will press against the water, while the broad surface of the other, or others, will give way to it, and by this means the vessel will be moved.

BOBENHAUSEN, a town of Germany, in Weteravia, with a castle; seated on the small river Gerfbrentz, three miles from Francfort on the Maine.

BOCAT, a fine valley of Syria, in Asia, in which are situated the magnificent ruins of Balbec. "It might be rendered," says Mr. Volney, "one of the richest and most beautiful spots in Syria, it being more fertile than the celebrated vale of Damascus, and better watered than the rich plains of Rama and Efracton."

BOCCALINI (*Encycl.*). From the last of this celebrated satirical virtual sovereign princes even did not escape. The cardinals Borghese and Gaetan having declared themselves his protectors, he published his *Ragguaglio di Parnasso*, and *La Secreteria di Apollo*, which is the continuation of the former. These two works were received by the public with uncommon applause. He there feigns, that Apollo, holding his court at Parnassus, heard the complaints of the whole world, and did justice according as the cases required. He at length printed his *Pietra di Parangone*; wherein he attacks the court of Spain, setting forth their designs against the liberty of Italy, and inveighing particularly against them for the tyranny they exercised in the kingdom of Naples. The Spaniards complained of him in form, and were determined at any rate to be revenged. Boccacini was frightened, and retired to Venice; but was there assassinated in a very strange manner. He lodged with one of his friends, who having got up early one morning, left Boccacini in bed; a minute after some armed men entered his chamber, and gave him so many blows with bags full of sand, that they left him for dead; so that his friend returning some time after, found him speechless. Great search was made at Venice for the authors of this murder; and though they were never discovered, it was universally believed that they were employed by the court of Spain.

BOCHIUS, or **Bocaur** (*Encycl.*), travelled into Italy, Germany, Poland, and Muscovy, and at his return became secretary to the duke of Parma. He died on the 13th of January, 1609. The critics in the Netherlands set so great a value on his poetry, that they gave him the name of the *Belgic Virgil*. He wrote, 1. *De Belgii Principatu*. 2. *Parodia Heronis Psalmodiarum Davidicarum*. 3. *Observationes Physicæ, Ethicæ, Politicæ, et Historicæ, in Psalmos*. 4. *Vita Davidis*. 5. *Orationes*. 6. *Pœmata*.

BOECLER (John Henry), historiographer of Sweden, and professor of history at Straßburg, was born in Franconia 1617, and died in 1686. He received pensions from several princes; among others, from Lewis XIV. and Christina, which latter invited him to Sweden. His principal works are, 1. *Commentationes Pliniane*. 2. *Timur, vulgo Tamerlanus*, 1657, 4to. 3. *Notitia Sancti Romani Imperii*, 1681, 4to. 4. *Historia, schola Principum*. 5. *Commentatio in Grotii librum de Jure Belli et Pacis*. With all the warmth and zeal, which commentators and biographers usually have for their principals, he lavishes panegyric upon Grotius. He swears, in a letter published after his death, that no man will ever approach him; and that whoever should attempt to equal this work of his, would only furnish matter for laughter to posterity.

BOETHIUS, **ROBCE**, or **BOEIS** (Hector), a famous Scottish historian, was born at Dundee, in the shire of Angus, about 1470. After having studied at Dundee and Aberdeen, he was sent to the university of Paris, where he applied to philosophy, and became a professor of it there. Here he contracted an acquaintance with several eminent persons, particularly with Erasmus, who kept a correspondence with him afterwards. Elphinston bishop of Aberdeen having founded the King's College in that city, about 1500, sent for Boeis from Paris, and appointed him principal: He took for his

colleague Mr. William Hay, and by their joint labour the kingdom was furnished with several eminent scholars. Upon the death of his patron he undertook to write his life, and those of his predecessors in that see. The work is in Latin, and entitled, *Vitæ Episcoporum Murrhacenensium et Aberdonensium*. Paris, 1522, quarto. He begins at Beatus, the first bishop, and ends at Gavin Dunbar, who was bishop when the book was published. A third part of the work is spent in the life of Elphinston, for whose sake it was undertaken. He next applied to write, in the same language, *The History of Scotland*; the first edition of which was printed at Paris, by Badius Ascensius, in 1526, which consisted of seventeen books, and ended with the death of James I. but the next, in 1574, was much enlarged, having the addition of the eighteenth book, and part of the nineteenth. The work was afterwards brought down to the reign of James III. by Ferrerius, a Piedmontese.

Mackenzie observes, that of all Scots historians, next to Buchanan, Boetius has been the most censured and commended by the learned men who have mentioned him. Nicolson tells us, that in the first six books there are a great many particulars not to be found in Fordun, or any other writer now extant; and that, "unless the authors which he pretends to have seen be hereafter discovered, he will continue to be shrewdly suspected for the contriver of almost as many tales as Geoffrey of Monmouth." His eighteenth book, however, is highly commended by Ferrerius, and other writers. He was a great master of polite learning, well skilled in divinity, philosophy, and history; but somewhat credulous, and much addicted to the belief of legendary stories.

BOFFRAND (Germain), a celebrated French architect, was the son of a sculptor, and of a sister of the famous Quinault; and born at Nantes, in Bretagne, 1667. He was trained under Harduin Mansard, who trusted him with conducting his greatest works. Boffrand was admitted into the French academy of architecture in 1709. Many princes of Germany chose him for their architect, and raised considerable edifices upon his plans. His manner of building approached that of Palladio, and there was much of grandeur in all his designs. As engineer and inspector-general of the bridges and highways, he caused to be constructed a number of canals, sluices, bridges, and other mechanical works. There is of this illustrious architect a curious and useful book, which contains the general principles of his art; to which is added, an account of the plans, profiles, and elevations, of the principal works which he executed in France and other countries. A very gracious idea is transmitted to us of this artist, who is represented as of a noble and disinterested spirit, and of a pleasing and agreeable manner. He died at Paris, in 1755.

BOG, a river of Poland, which runs south-west through Podolia and Budziac Tartary, falling into the Black Sea, between Oczakow and the river Dnieper.

BOILER. Many ingenious vessels and utensils have, at different periods, been invented, with a view to facilitate the process of boiling, and save the consumption of fuel. In the latter respect, Count Rumford stands at the head of those experimental enquirers, who have directed their labours to the benefit of society; yet we must confess that there is still great room for improvement. One of the latest inventions in this department of domestic economy, is that of Mr. Tho. Rowntree, engine-maker, of Great Surrey-street, Blackfriars-road, who, in 1798, obtained a patent for "a new method of applying fire for the purpose of heating boilers and other vessels, where heat is required." But as the patentee had not given a clear specification, from which an ordinary tradesman could have constructed a furnace on his principles, without any farther explanation, his patent was declared void, after a trial be-

fore Lord Eldon, and a special jury, on the 3d of November last, and has consequently become public property. These proceedings, however, have been attended with a good effect, as the obscure account published by Mr. Rowntree, has been more clearly defined by the evidence given in court, especially by that of Mr. Hindmarsh. We shall, therefore, present our readers with the specification communicated by the patentee, and accompanying it with the necessary illustrations.—The following is a literal abstract of the inventor's description:—"For heating of coppers, boilers, furnaces, ovens, and stoves, my fire-place is much smaller than heretofore made use of for the same sized copper, boiler, furnace, oven, or stove. Instead of placing my fire-place, according to the common practice, immediately under the boiler, or other vessel, I place it at the front, side, or end, as I see most convenient, in such a manner as to oblige the flame to rise in the front, side, or end, and pass all round the vessel, &c. while at the same time it strikes the bottom of the vessel, &c. without suffering the flame to pass off in a flue, or flues, as it usually does in the common way, and by that means sending the heat into the flues, instead of its being used where it ought to be, namely, on the vessels, &c.; this my method effectually prevents; for, by means of a small perpendicular or other opening, into a box or trap, which I call a reservoir, and which I place horizontally, or diagonally, as the situation may require, and is made of iron, brick, stone, or any other material capable of bearing heat, where a valve is placed riding on centres or otherwise, and standing in a diagonal or other direction, as is found most convenient, the flame is returned or impeded in its progress to the chimney, and made to descend below the bottom of the vessel, and pass out at the bottom, top, or side of said box, trap, or reservoir, into the common chimney. This reservoir is placed between the vessel, &c. and the chimney. To the opening, which admits the flame into the reservoir, are affixed, when necessary, sliders, registers, or stops, which serve to increase or diminish the heat. The valve in the reservoir is for the same purpose in another degree, which more immediately appertains to increasing or diminishing the draught, which it does by moving the said valve into different positions, as the speed of the operation may require."

It would be needless to state the particulars of the evidence relative to the effect produced to the new-invented furnaces, in heating boilers, &c. as well as the great saving of fuel, which was proved to be more than one-third, and in some cases nearly one-half, of what is usually consumed in furnaces constructed on the old plan. Hence we shall communicate only the substance of Mr. Hindmarsh's evidence, which greatly tends to illustrate the principles of the invention. This, he conceives, principally consists in the three following circumstances:

1. In the peculiar mode of constructing the furnace, or setting the boiler, and of placing the fire, not immediately under, but a little in front, or at one side of it, whereby the flame and hot air can get access to every part of the vessel, and not only strike with force against its bottom, with also with equal effect reverberate against, and violently embrace, its sides, and whole external surface; unlike every former contrivance, the most perfect of which could only cause the flame and hot air to act partially upon the bottom and sides of the vessel.

2. In the elevated situation, and smallness, of the aperture leading from the furnace towards the chimney; whereby the flame and hot air are impeded in their progress to the atmosphere, and compelled to tarry in the cavity of the furnace, and occupy every part thereof much longer than they otherwise would do. This effect in stopping, checking, and as it were arresting the flame and hot air, in their attempt to escape into the atmosphere, Mr. Hindmarsh considered as not only new, but singularly beneficial; for, by this means, the

flame and hot air are detained in the very place where their presence is most wanted, and constrained to give forth their energies with an impetus against the bottom and sides of the vessel to be heated; whereas, in none of the furnaces heretofore erected, was any effectual stop interposed between the fire and the chimney, to cause the flame and hot air to dwell under and round the sides of the vessel; but they passed rapidly off into the atmosphere, either by a direct communication through the chimney, or indirectly, but almost as speedily, by flues; or else by a drain (as it is called), the aperture of which is equal in dimensions to that of the chimney itself.

3. In an open space between the furnace and chimney, called by the patentee a box, trap, or reservoir, and intended as a receptacle of the flame, hot air, and smoke, after they have quitted the furnace, and passed through the small aperture as above described. This space, or reservoir, for the flame, hot air, and smoke, being closed at the top and external sides, and open only at the bottom outwards, for the purpose of permitting the smoke, &c. to pass off into the chimney, fill farther checks and detains the flame and hot air in the furnace; and being itself constantly full of warm air, smoke, &c. causes the heat to be reverberated against the sides and bottom of the vessel or boiler, and effectually prevents the admission of the cold atmospheric air from the chimney, which, on the old plans of construction, is found by experience to rob the furnace and vessel of more than half the supply of heat which any given quantity of fuel is capable of yielding. The valves, sliders, and dampers, are not essential parts of the invention, but merely as regulators, which, in many cases, may be altogether omitted, without detriment to the operation of the fire.

Although Count Rumford has successfully extended his researches to discover the most economical plan in the management of fire, and the generation of heat for culinary and other purposes, it does not appear from his writings, that he had a distinct conception of the new method suggested by Mr. Rowntree, till after the enrolment of his specification in May 1798. Nay, says Mr. Hindmarsh, the count evidently takes it for granted (see vol. II. p. 73, of his *Essays*), and even reasons on the fact, which he there supposes to be unavoidable, and beyond remedy, that the fire cannot be made to impinge against the sides of a vessel with the same force and effect as against the bottom: which is a plain proof, that at the time of writing that essay, he was totally unacquainted with Mr. Rowntree's method of applying and managing the fire; in which the very effect which the count considers as a desideratum in science, and which appears to have been one grand object of his philosophical pursuits, is now in a great measure completed.

BOILING, or EBULLITION (*Encycl.*). Count Rumford, in his admirable *Essays*, has taken much pains to impress on the minds of those who exercise the culinary art the following simple, but *practical important fact*, namely, that, when water begins only to be agitated by the heat of the fire over which it is placed, it is *incapable of being made hotter*; and that the violent ebullition occasioned by the application of more heat, is nothing more than an unprofitable dissipation of the water in the form of steam, and an absolute waste of the fuel employed. See *FIRE-PLACE*.

BOLABLOA, one of the Society Islands, in the South Pacific Ocean, surrounded by a reef of rocks, and several small islands, none of them more than eight leagues in compass. It is four leagues to the north-west of Otahe.

BOLBITINUM (anc. geog.), the second month of the Nile reckoning from west to east; now very small, choaked up with sand, and called *le Bras de Beldin*.

BOLENTIUM (anc. geog.), a town of Pannonia Superior; now *Rackerburg* in Stiria.

BOLSEC (Jerome), a Carmelite of Paris; who, having

preached somewhat freely in St. Bartholomew's church, forsook his order, and fled into Italy. He set up for a physician, and married; but soon after did something or other for which he was driven away. He set up afterwards in Geneva as a physician; but not succeeding in that profession, he went over to divinity. At first he dogmatized privately on the mystery of predestination, according to the principles of Pelagius; and afterwards had the boldness to make a public discourse against the received opinion. Upon this Calvin went to see him, and censured him mildly. Then he sent for him to his house, and endeavoured to reclaim him from his error; but this did not hinder Bolsec from delivering in public an insulting discourse against the decree of eternal predestination. Calvin was among his auditors; but, hiding himself in the crowd, was not seen by Bolsec, which made him the bolder. As soon as Bolsec had ended his sermon, Calvin stood up, and confuted all he had been saying. This was not all; a magistrate, who was present in that assembly, called him a seditious fellow, and sent him to prison. The cause was discussed very fully; and at last, with the advice of the Swiss churches, the senate of Geneva declared Bolsec convicted of sedition and Pelagianism; and as such banished him from the territory of the republic, on pain of being whipped if he should return thither. This was done in 1551. He retired into a neighbouring place, which depended on the canton of Bern, and raised a great deal of disturbance there. He boldly accused Calvin of making God the author of sin. Calvin, to prevent the impositions which such complaints might make upon the gentlemen of Bern, caused himself to be deputed to them, and pleaded his cause before them. He was so fortunate, that though he could not get a determination upon his doctrine, whether it was true or false, yet Bolsec was ordered to quit the country.

He retired to France, and applied himself to the Protestants; first at Paris, and afterwards at Orleans. He shewed a great desire to be promoted to the ministry, and to be reconciled to the church of Geneva; but the persecution that arose against the protestants, made him resolve to take up his first religion, and the practice of physic. He went and settled at Autun, and prostituted his wife to the canons of that place; and, to ingratiate himself the more with the papists, exerted a most flaming zeal against the reformed. He changed his habitation often: he lived at Lyons in 1582, as appears by the title of a book, which he caused to be printed then at Paris, against Beza. He died not long after; for he was not living in 1585. The book just mentioned is entitled, *The History of the Life, Doctrine, and Behaviour, of Theodore Beza*, called the Spectable great Minister of Geneva. This was preceded by the History of the Life, Actions, Doctrine, Constancy, and Death of John Calvin, heretofore Minister of Geneva; which was printed at Lyons, in 1577. Both these histories are altogether unworthy of credit; as well because they are written by an author full of resentment, as because they contain facts notoriously false.

BOLTON (Dr. Robert), was born in Northamptonshire, about the year 1690, and received his education at Wadham College, Oxford, where, on the 13th of June, 1728, he took the degree of master of arts. Being a valetudinarian and hypochondriac, he found a college life not agreeable to his temper; and being possessed of a small private fortune, he did not long reside at Oxford. In 1720 he lived at Fulham, where his acquaintance commenced with Mrs. Butler, which afterwards occasioned his being known to Mr. Pope; and he sometimes took up his abode with old Lady Blount, at Twickenham. About 1724 he resided at Kensington, where the celebrated Mr. Whiston then dwelt; and in part by his recommendation, on the resignation of Dr. Butler, afterwards bishop

of Durham, of the chaplainship of Sir Joseph Jekyl, master of the rolls, our author was received into that gentleman's family in the same capacity, and continued there unto the time of Sir Joseph's death.

Dr. Bolton's connection with Sir Joseph Jekyl, introduced him to the patronage of Lord Hardwicke, by whose means, in the year 1735, he was promoted to the deanery of Carlisle. In 1738 he was appointed vicar of St. Mary's, Reading; and both these preferments, the only ones he ever received, he held until the time of his death. He was an excellent parish priest, and a good preacher; charitable to the poor, and having, from his own valetudinary state, acquired some knowledge of physic, he kindly assisted them by advice and medicine. He was greatly beloved by his parishioners, and deservedly; for he performed every part of his duty in a truly exemplary manner. On Easter Tuesday, 1739, he preached one of the Spital sermons at St. Bride's, Fleet-street, which was afterwards printed in quarto. We do not find that he aspired to the character of an author, though so well qualified for it, until late in life. His first performance was entitled, *A Letter to a Lady on Card-playing on the Lord's-day*, 8vo. 1748, setting forth, in a lively and forcible manner, the many evils attending the practice of gaming on Sundays, and of an immoderate attachment to that fatal pursuit at any time. In 1750 appeared *The Employment of Time*, three essays, 8vo. dedicated to Lord Hardwicke; the most popular of our author's performances; and, on its original publication, generally ascribed to Gilbert West. The next year, 1751, produced *The Deity's Delay in punishing the Guilty*, considered on the Principles of Reason, 8vo.; and in 1755, *An Answer to the Question, Where are your Arguments against what you call Lewdness, if you can make no Use of the Bible?* 8vo.

Continuing to combat the prevailing vices of the times, he published, in 1757, *A Letter to an Officer of the Army on Travelling on Sundays*, 8vo.; and, in the same year, *The Ghost of Erastus, Great Grandfather of her Royal Highness the Princess Dowager of Wales; with some Account of his Life*, 8vo. Each of the above performances contains good sense, learning, philanthropy, and religion, and each of them is calculated for the advantage of society.

The last work which Dr. Bolton gave the public, was not the least valuable. It was entitled, *Letters and Tracts on the Choice of Company, and other Subjects*, 8vo. 1761. This he dedicated to his early patron, Lord Hardwicke, to whom he inscribed *The Employment of Time*, and who at this period was no longer chancellor. He died at London, on the 26th of November, 1763, and was buried in the porch between the first and second door of the parish church of St. Mary, Reading.

BOLZANO, a large and handsome town of Germany, in the Tyrol, on the river Eisach, twenty-seven miles north of Trent. Long. 11. 26. E. Lat. 46. 35. N.

BONA (John), a cardinal, famous for piety and learning, was descended from an ancient and noble family, and born at Mondovi, a town in Piedmont, upon the 10th of October, 1609. He was devoted to solitude, and had a contempt of the world from his infancy. At fifteen years of age he betook himself to a monastery near Pignerol, belonging to the begging friars of the order of St. Bernard; and in 1651 was made general of his order. Cardinal Fabio Chigi, who was Bona's great friend, and in 1655 chosen pope, under the name of Alexander VII. would have had him to have continued in this office, and used some means to prevail with him; but Bona pressed so earnestly to be discharged, that the pope at length suffered him to resign it. He did it, however, upon this condition, that Bona should not depart from Rome; and,

in order to reconcile him to it, gave him several considerable places. Clement IX. continued him in these places, conferred upon him new ones, and made a cardinal of him in November, 1669. This pontiff dying soon after, many people wished that Bona might succeed him in the holy see; but they were disappointed.

Bona was very learned, held a correspondence with most of the literati in Europe, and was sometimes at the pains of revising and correcting their works. He was the author of several things himself, chiefly written in the devotional way, which were much esteemed, and have been translated most of them into French. Bona died at the age of sixty-five.

BONA (*Encycl.*), a sea-port town of Algiers. The inhabitants deny it to be the ancient Hippo, which had been so often taken, retaken, and destroyed by the wars; and pretend it to be since rebuilt at the distance of two or three miles from the ancient Hippo, out of its ruins, and called *Balc-el-Ugned*, from a sort of trees that name that grow in the neighbourhood. It is now a very mean place, poorly built, and thinly inhabited, with scarce any traces of its former grandeur, except the ruins of a cathedral, or, as others guess, of a monastery, built by St. Austin, about three miles distance from the city. Near these ruins is a famed spring called by his name, much resorted to by the French and Italian sailors, who come to drink of its waters, and pay their devotions to a maimed statue, said also to belong to the saint, but so mutilated that no traces either of face or dress are remaining; and as each of them strives to break off some splinter, or to scrape off some part of it, on account of its supposed sanctity, it will probably be soon reduced to a state of non-existence. Bona was taken by the pirate Barbarossa, and joined to his new kingdom of Algiers; but as quickly lost, and recovered by its old masters the Tuniseens, who soon after lost it again. It is commanded by a little fort, in which is a garrison of about 300 Turks, under the command of an aga, who is also governor of the town. The road for the ships is good for nothing before the town, but a little farther west is very deep and safe. Dr. Shaw tells us, that the continual discharging of ballast into the road, and the neglect of cleansing the port which came to the very walls, is the cause of both becoming so unsafe and inconvenient; though this might be easily remedied, so as to make the town one of the most flourishing in all Barbary.

BONAVENTURE of Padua, a cardinal, was born in that city in 1332, and descended from a noble and illustrious family. He studied divinity at Paris, where he distinguished himself by his uncommon parts and application. He was of the order of St. Augustin, of which he was made general in 1377. Pope Urban VI. gave him a cardinal's cap the year after; which engaging him to stand up for the rights of the church against Francis de Carrario of Padua, that petty monarch contrived to have him murdered. He was dispatched with the shot of an arrow, as he was passing St. Angelo's bridge at Rome, in 1386. He was the author of several works: as, *Commentaries upon the Epistles of St. John and St. James, Lives of the Saints, Sermons, Speculum Maris*, &c.

BONAVISTA, a cape on the east side of the island of Newfoundland.

BONNA (anc. geog.), one of the fifty citadels built by Drusus on the Rhine; supposed by some to be the same with the *Ara Ubiorum*: now BONN.

BONNER (*Encycl.*). The following pieces were published under the name of this prelate. 1. Preface to the Oration of Stephen Gardiner, bishop of Winchester, concerning true obedience. 2. Several letters to the lord Cromwell, 3. A Declaration to Lord Cromwell, describing to him the evil behaviour of Stephen (bishop of Winchester). 4. Letter of his

about the proceedings at Rome concerning the king's divorce from Catharine of Arragon. 5. An Admonition and Advertisment given by the Bishop of London to all readers of the Bible in the English tongue. 6. Injunctions given by Bonner, bishop of London, to his clergy (about preaching), with the names of books prohibited. 7. Letter to Mr. Lechmore. 8. Responsum & Exhortatio; Lond. 1553, 8vo. Answer and exhortation to the clergy in praise of priesthood: spoken by the author in St. Paul's cathedral, the 16th October, 1553. 9. A Letter to Mr. Lechmore, 6th September, 1553. 10. Articles to be enquired of in the general visitation of Edmund bishop of London, exercised by him in the year 1554, in the city and diocese of London, &c. 11. A profitable and necessary Doctrine, containing an Exposition on the Creed, seven Sacraments, ten Commandments, the Pater Noster, Ave Maria, with certain Homilies adjoining thereto, for the instruction and information of the diocese of London. 12. Several letters, declarations, arguings, disputes, &c. of his are extant in John Fox's Book of Martyrs. 13. His Objections against the Proceeds of Robert Horne, bishop of Winchester, who had tendered the oath of supremacy to him a second time.

BONNEVAL (Claudius Alexander de), count, known in the latter part of his life by the name of *Ojman Bahaw*, descended from a family related to the blood-royal of France, entered himself at the age of sixteen in the service of that crown, and married the daughter of Marfhal de Biron. He made the campaign in Flanders in 1690; but soon after left the French army, and entered into the imperial service under Prince Eugene, who honoured him with an intimate friendship. The intrigues of the Marquis de Prié, his inveterate enemy, ruined his credit, however, at the court of Vienna, and caused him to be banished the empire. He then offered his service to the republic of Venice, and to Russia; which being declined, his next tender was to the Grand-Signior, who gladly received him: it was stipulated, that he should have a body of 30,000 men at his disposal; that a government should be conferred on him, with the rank of bahaw of three tails, and a salary of 10,000 aspers a-day; and that, in case of a war, he should be commander in chief. The first expedition he engaged in after his arrival at Constantinople, was to quell an insurrection in Arabia Petrea, which he happily effected; and at his return had large offers made him by Kouli Khan, but he did not choose to accept them. Some time after, he commanded the Turkish army against the emperor, over whose forces he gained a victory on the banks of the Danube. But success does not always protect a person against disgrace; for Bonneval, notwithstanding his service, was first imprisoned, and then banished to the island of Chio. The sultan, however, continued his friend; and the evening before his departure made him bahaw-general of the Archipelago, which, with his former appointment of beglerbeg of Arabia, rendered him one of the most powerful persons in the Ottoman empire. In this island he found a retirement quite agreeable to his wishes; but did not long enjoy it, being sent for back, and made *topigi* or master of the ordnance, a post of great honour and profit. He died in this employment, aged seventy-five, in 1747, and wrote the memoirs of his own life.

BONNY, a town of France, in the ci-devant Gatinois, seated at the confluence of a river of the same name with the Loire. E. long. 2. 54. N. lat. 47. 36.

BONONIA (anc. geog.), a town of Panonia Inferior, between Muria to the north-west, and Taurinum to the east.—Another Bononia, a town of Mesia Superior, on the Danube; now *Bodon*, in Bulgaria. See **BODON**.

BONWICKE (Ambrose), a nonjuring clergyman of great piety and learning, son of the Rev. John Bonwicke, rector of

Mickleham in Surrey, was born April 29, 1652, and educated at Merchant Taylors' school; he was elected to St. John's College, Oxford, in 1668, where he was appointed librarian in 1670; B.A. 1673; M.A. March 18, 1675; was ordained deacon May 21, 1676; priest, June 6 (Trinity Sunday), 1680; proceeded B.D. July 21, 1682; and was elected master of Merchant Taylors' school, June 9, 1680. In 1689, the college of St. John's petitioned the Merchant Taylors' company, that he might continue master of the school (which is a nursery for their college) for life; but at Christmas, 1691, he was turned out for refusing to take the oath of allegiance, and was afterwards for many years master of a celebrated school at Headley, near Leatherhead, in Surrey, where he had at one time the honour of having the poet Fenton for his usher, and Bowyer (who was afterwards the learned printer) for a scholar.

BOODGE-BOODGE, a town of Hindoostan Proper, capital of the rajah of Cutch, 330 miles N.E. by E. of Surat. Long. 68. o. E. Lat. 23. 16. N.

BOOK-BINDING (*Encycl.*). The following is an extract from the specification of the patent granted to Mr. Ebenezer Palmer, of Saint Mary Cole, Cheapside, stationer; for an improved mode of binding books, especially merchants' account books. It is dated December 30, 1800. The improvement consists in the addition of a metallic hinge or chain, contrived and made in the following manner:

"First. There are certain various small bars of metal, or composition of metals, about the thickness of a shilling, or more, according to the size and thickness of the book to be made, the length of each such bar being from half an inch to several inches long, in proportion to the strength required in the back of the book.

"Secondly. At each end of every such bar of metal is made a pivot, by being filed down, or otherwise, and which are of different lengths, also in proportion to the thickness of two links, which they are to receive.

"Thirdly. There are a certain number of links, made rather in an oval form, to the said hinge, each of which contains two holes, according to the sizes of the pivots they are to go on, which links are of the same metal as the hinge, or a composition of metals, as is judged necessary; each of the said links being nearly the length that two of the above-described bars are wide.

"Fourthly. When such metallic pivots are prepared, the afore-mentioned links are then rivetted on those pivots, each pivot receiving two links, and thereby hold the said hinge together, on the principle of a link-chain or hinge.

"Fifthly. There are two holes, or more, of different sizes, as required in each bar of the hinge or chain, by which means each section of the book is strongly fastened to the same; which hinge, so fastened, operates with the back of the book, when bound, in such an improved manner that thereby occasions the said sections to open in such a manner as to bring them on a parallel with each other, and in consequence thereof admit of the ruled lines being written into, even close to the back, without any inconvenience."

BOOK-KEEPING (*Encycl.*). In the year 1796, a patent was granted to Mr. Edward Thomas Jones, of Bristol, for his method or plan of detecting errors in accounts of all kinds, by which they may be adjusted in a regular and concise manner. This work is entitled, *The English System of Book-keeping*, which requires a day-book, or journal, an alphabet, and a ledger, ruled in the following manner: namely, the day-book has three columns on each page, for receiving the amount of the transactions; one column of which to receive the amount of the debits and credits, one column to receive the debits only, and another to receive the credits only; or it may be ruled

with only two columns on each page, one to receive the amount of the debits, and the other the amount of the credits. There must also be on each page of the day-book, four other columns ruled, two on the left side, next the amount of the debits, and two on the right side next the amount of the credits, for receiving the letter or mark of posting, and the page of the ledger to which each amount is to be posted. The alphabet need not be ruled at all, but must contain the name of every account in the ledger, the letter that is annexed to it as a mark of posting, and the page of the ledger. The ledger must be ruled with three, four, five, or seven columns on each page, as may be most agreeable, for receiving the amounts of the different transactions entered in the day-book.

But in order to prevent any mistakes that may happen from the hurry of business in a counting-house, Mr. Jones has given only one column for receiving the amount of every transaction, whether debits or credits, at the instant of making the entry: and, for the convenience of separating the debits from the credits, previous to posting, which is necessary to prevent confusion and perplexity, he has two other columns on the same page; that on the left side, into which the amount of every debit must be carefully entered, and that on the right for the amount of the credits; which columns must be cast up once a month. The column of debits and credits of itself forms one amount; the column for the debits produces a second amount; and the column of credits a third amount; which second and third amounts, added together, must exactly agree with the first amount, or the work is not done right. By this means, the man of business may obtain monthly such a statement of his affairs, as will show how much he owes for that month, and how much is owing to him; and the debits being added together for any given time, with the value of the stock of goods on hand, will, when the amount of the credits is subtracted therefrom, shew the profits of the trade.

The patentee's manner of examining the books kept by this method, also professedly differs from that hitherto practised, as well in expedition as in the certain accuracy which attends the process; it being only necessary to cast up the columns through the ledger debits and credits, according to the examples given, and the amount of those columns, if right, must agree with the columns in the day-book for the same corresponding space of time. These castings should take place once a month, and if the amounts do not agree, the posting must then, but not else, be called over; and when the time, whether it be one, two, three, or four months, that is allotted to each column of the ledger, is expired, the amount of each column should be put at the bottom of the first page, and carried forward to the bottom of the next, and so on to the end of the accounts; taking care that the amount in the day-book, of each month's transactions, be brought into one gross amount for the same time.

Having already enlarged upon this subject, we shall only observe, that this new system of book-keeping, however ingeniously contrived, has not met with that general approbation to which it is apparently entitled. To enforce his claim to public patronage, Mr. Jones concludes the specification of his patent by asserting, that upon his plan every page will be proved in the progress of calculation, and "the balance of ten thousand ledgers could not unobviously be taken off wrong."—We give him full credit for this assertion; though it has, perhaps by invidious rivals, been objected that his method is more complicated than the old Italian system of book-keeping; which has, by experience, been found fully adequate to the purpose of mercantile accuracy.

BOOTHAN, a country N.E. of Hindoostan Proper, between Bengal and Thibet, of which last it is a feudatory or dependency. The southernmost ridge of the Bootan mountains rises

near a mile and a half perpendicular above the plains of Bengal, in a horizontal distance of only fifteen miles; and from the summit the astonished traveller looks back on the plains, as on an extensive ocean beneath him. The capital of this country is Teshafudon.

BOOTH (Barton), a famous English actor, born in Lancashire in 1681, and educated in Westminster school under the celebrated Mr. Busby, where his success in the Latin plays customarily performed by the scholars gave him an inclination for the stage. He was intended for the church; but running away from school to Dublin, he there commenced actor. His first appearance was in the part of Oroonoko, in which he came off with every testimonial of approbation from the audience. From this time he continued daily improving; and, after two successful campaigns in that kingdom, conceived thoughts of returning to his native country, and making a trial of his abilities on the English stage. To this end, he first, by letter, reconciled himself to his friends; and then, as a further step towards insuring his success, obtained a recommendation from Lord Fitzharding (one of the lords of the bed-chamber to Prince George of Denmark) to Mr. Betterton, who with great candour and good-nature took him under his care, and gave him all the assistance in his power. The first part Mr. Booth appeared in at London was that of Maximus in Lord Rochester's *Valentinian*, his reception in which exceeded even his most sanguine expectations; and very soon after his performance of *Artaban*, in Rowe's *Ambitious Step-mother*, which was a new tragedy, established his reputation, as second at least to his great instructor. *Pyrrhus*, in the *Distressed Mother*, was another part in which he shone without a rival. But he was indebted to a happy coincidence of merit and chance, for that height of fame which he at length attained in the character of Cato, as drawn by Mr. Addison, in 1712. For this play being considered as a party one, the Whigs, in favour of whose principles it was apparently written, thought it their duty strongly to support it; while at the same time the Tories, who had too much sense to appear to consider it as a reflection on their administration, were still more vehement in their approbation of it, which they carried to such an height, as even to make a collection of fifty guineas in the boxes during the performance, and present them to Mr. Booth with this compliment, "That it was a slight acknowledgment for his honest opposition to a perpetual dictator, and his dying so bravely in the cause of liberty." Besides this, he had a present of an equal sum from the managers, in consideration of the great success of the play, which they attributed in a good measure to his extraordinary merit in the performance; and certain it is, that no one since that time has ever equalled, or even nearly approached, his excellence in that character.—But these were not the only advantages which were to accrue to Mr. Booth from his success in this part; for Lord Bolingbroke, then one of the principal secretaries of state, in a little time after procured a special licence from Queen Anne, recalling all the former ones, and nominating Mr. Booth as joint manager with Wilks, Cibber, and Dogget; none of whom were pleased at it; but the last especially took such disgust as to withdraw himself from any further share in the management. In 1704 Mr. Booth had married a daughter of Sir William Barkham, bart. who died in 1710 without issue. Being now established in the management, he once more turned his thoughts towards matrimony; and in the year 1719 united himself to the celebrated Miss Hester Santlow, a woman of a most amiable disposition, whose great merit as an actress, added to the utmost discretion and prudent economy, had enabled her to save up a considerable fortune. During the twenty years in which Mr. Booth continued a manager, the theatre

was in the greatest credit; and his illness and death, which happened on the 10th of May, 1733, contributed not a little to its decline.

Mr. Booth wrote a dramatic entertainment called *Dido and Æneas*; but his master-piece was a Latin inscription to the memory of Mr. William Smith, a celebrated actor, who died while he was young.—As an actor, his excellency lay wholly in tragedy, not being able to endure such parts as had not strong passion to inspire him. And, even in this walk, dignity rather than complacency, rage rather than tenderness, seemed to be his taste. For a particular idea of his abilities, we must refer to the description Mr. Cibber has given of him in his *Apology*; and the admirable character drawn of him by that excellent judge of dramatic perfection, Aaron Hill, esq. in a political paper published by him called the *Prompter*, which may be seen at length in Theoph. Cibber's *Lives of the Poets*, and Chetwood's *History of the Stage*.—His character as a man was adorned with many amiable qualities, among which, a goodness of heart, the basis of every virtue, was remarkably conspicuous; and so particularly was he distinguished and cherished, and his company sought by the great, that, as Chetwood relates of him, not one nobleman in the kingdom had so many sets of horses at command as he had.

BORBETOMAGUS (anc. geog.), a city of the Vaugiones on the Rhine; now *Worms*, in Germany.

BORCOVIUM (anc. geog.), a town of the Ottadini in Britain, now *Berwick-on-Tweed*.

BORDE (Andrew), a physician, was born at Pevensey in Suffex, early in the 16th century, and supposed to have been educated at Westminster school. In his Introduction to Knowledge, he says that he was a student of Oxford; but of what college, he does not mention. He left the university without a degree, and entered himself a brother of a Carthusian convent in or near London; but, not liking the severe discipline of that order, he returned to Oxford, and applied himself to the study of physic. Some time after, he embarked for the Continent; and, as he himself expresses it, "travelled through and round about Christendom, and out of Christendom into some parts of Africa." In the years 1541 and 1542 he resided at Montpellier in France, where he was made doctor of physic, and after his return to England was incorporated into the same degree at Oxford. From the preface to his introduction above mentioned, it appears that he had been in Scotland, which probably was soon after his return from France. Having now satisfied his inclination for travelling, he settled first at Pevensey where he was born, afterwards at Winchester, and finally in London, where he is said to have become a fellow of the college of physicians, and first physician to King Henry VIII. But, notwithstanding his eminence in his profession, he had the misfortune to spend the latter end of his life in the Fleet prison, where he died in the year 1549. As to his character, Wood says, that "he was esteemed a noted poet, a witty and ingenious person, and an excellent physician." Pits calls him a man of sufficient learning, but too volatile and inconstant. Bale and some others, on the contrary, abuse him grossly. His writings are: 1. A book of the introduction of knowledge, the which doth teach a man to speak part of all manner of languages, &c. Lond. 1542, 4to., dedicated, from Montpellier, to the Lady Mary, daughter to Henry VIII. It is written partly in verse, and partly in prose, containing thirty-nine chapters, before each of which is a wooden print of a man. 2. The breviary of health, wherein are remedies for all manner of sicknesses and diseases, &c. Lond. 1547, &c. 4to. 3. Dietary of health, Lond. 1576, 8vo. 4. The merry tales of the madmen of Gotham. Printed, says Wood, in the time of Henry VIII. in whose reign, and after, it was accounted a book full of wit and mirth by scholars and

gentlemen. Afterwards being often printed, it is now sold only on the stalls of ballad-singers. 5. A right pleasant and merry history of the mylner of Abington, with his wife and his fair daughter, and of two poor scholars of Cambridge. Lond. printed by Richard Jones, 4to. 6. A book of every region, country, and province; which shews the miles and leagues distance from city to city, and from town to town, with the noted things in the said cities and towns. Wood says that the author lent the manuscript of this book to his friend Thomas Cromwell, who lost it, to the great grief of the author, who would otherwise have published it. In this instance, however, the antiquary was misinformed; for it has since been published by Hearne at the end of *Benedictus abbas Peterb. de vita Henrici II.* Oxf. 1735, 8vo. 7. The principles of astronomy, the which diligently persecuted is in a manner a prognostication to the world. Lond. printed by Robert Copland, 12mo. The author says that he wrote this little book in four days, with one old pen without mending.

BORDUNI, or **BORDONE** (Paris), an excellent Italian painter, was born at Venice about the year 1512; and, being of a noble family, had a polite education. He was the disciple of Titian; but has been admired more for the delicacy of his pencil than for the truth of his outlines. He was at the court of France in the reign of Francis I. who had a great esteem for him, and for whom he drew not only abundance of history-pieces, but the portraits of several court-ladies, in so fine a manner, that original nature was hardly more charming. He at length returned to Venice, laden with riches and honour; and having gained great reputation in all parts of Italy, died in 1587, aged seventy-five.

BOREL (Peter), a learned physician, was the son of James Borel, who published several poems, and was born at Castrès in 1620. He applied himself to the study of physic, of which he was created doctor, and practised with great success in the city of Castrès. Towards the end of the year 1653 he went to Paris, and was soon after made physician in ordinary to the king. In 1674 he was received into the Academy of Sciences, and distinguished himself by writing a great number of works. The most esteemed are, 1. *Hijtoriarum & Observationum medico-physicarum*. 2. *Bibliotheca Chymica, duodecimo*. 3. *De vero telescopii inventore, cum brevis omnium conspiciendorum historia*. He died in 1678.

BORELLI (John Alphonso), a famous philosopher and mathematician, born at Naples the 28th of January, 1608. He was professor of philosophy and mathematics in some of the most celebrated universities of Italy, particularly at Florence and Pisa, where he became highly in favour with the princes of the house of Medici; but having been engaged in the revolt of Messina, he was obliged to retire to Rome, where he spent the remainder of his life under the protection of Christina queen of Sweden, who honoured him with her friendship, and by her liberality towards him softened the rigour of his hard fortune. He continued two years in the convent of the regular clergy of St. Pantaleon, called the *pious schools*, where he instructed the youth in mathematical studies. He died there of a pleurisy, the 31st of December 1679, in the 72d year of his age. He wrote, in Latin, 1. *Euclid restituted*. 2. The theory of the influence of the planets in medicine, deduced from physical causes. 3. Of percussive force. 4. Of natural motions depending upon gravity. 5. An historical and meteorological account of the burning of mount Ætna, in the year 1669. 6. Of the motion of animals; and several other works, some of which are in Italian.

BORGIA (Cæsar), natural son of Pope Alexander VI. was a brave general, but a most abandoned villain. It is incredibly what numbers he caused to be taken off by poison, or by the sword; and it is notorious that swarms of assassins were con-

stantly kept in pay by him at Rome, for the sake of removing all who were either obnoxious or inconvenient to him. He experienced various turns of fortune; and was sometimes very prosperous, sometimes the reverse. He very narrowly escaped dying by poison in 1503: for having concerted with the pope a design of poisoning nine newly created cardinals at once, for the sake of possessing their effects, the poisoned wine, destined for the purpose, was by mistake brought to and drank by themselves. The pope died of it; but Cæsar, by the vigour of his youth, and the force of antidotes, after many struggles, recovered. He only recovered to outlive his fortune and grandeur, to see himself depressed, and his enemies exalted; for he was soon after divested of all his acquisitions, and sent a prisoner to Spain, in order to free Italy from an incendiary, and the Italian princes from those dangers which the turbulent and restless spirit of Cæsar made them fear even though he was unarmed. He escaped from thence; and got safe to Navarre, to King John his brother-in-law, who was then at war with his subjects. Cæsar served as a volunteer in that war, and was killed in 1507.

BORGOGNONE, a celebrated painter, whose true name was *Giacomo Cortesi*; but he is commonly called *Borgognone*, from the country where he was born, about the year 1606. He was much admired and highly applauded for his admirable gusto, and grand manner of painting battles. He had for several years been conversant in military affairs, was an officer of considerable rank in the army, made the camp his school, and formed all his ideas from what he had seen performed in the field. His style is roughly noble, full of fire and spirit, and there are a few prints etched by his own hand. Towards the close of his life he retired to the Jesuits' convent in Rome, where he is said to have taken sanctuary to rid his hands of an ill bargain he had got of a wife. But happily surviving her, he lived in great esteem and honour till after the year 1675.

BORISTHENES (anc. geog.), the largest river of Sarmatia Europea, thus described by Mela, who copies *verbatim* from Herodotus: "It runs through a cognominal people, is the most pleasant of all the rivers of Scythia, and calmer than all of them in its course, and very agreeable to drink: it feeds very rich pastures, and produces large fish of the best flavour, and without bones: it comes a great way, rising from springs unknown; its course is a distance of forty days, and so far it is navigable." It is now called the *Dnieper* or *Nieper*.

BORLASE (Dr. Edmund), an eminent physician and English writer in the 17th century, was the son of Sir John Borlase, master of the ordnance, and one of the lord justices of Ireland in 1643. He studied in Dublin College, and afterwards at the university of Leyden, at which last place he took the degree of doctor of physic. He afterwards practised physic with great success in the city of Chester, and was incorporated doctor of the faculty in the university of Oxford. Among the books which he wrote and published are the following: 1. *Lathan Spaw in Lancashire*, with some remarkable cures and cures performed by it. 2. *The reduction of Ireland to the crown of England*. 3. *The history of the Irish rebellion*. 4. *Brief reflections on the Earl of Castlehaven's memoirs, &c.* He died after the year 1682.

BORNOU (*Encycl.*). No information can be obtained of this country from the actual visits of any European; but Mr. Lucas, the geographical missionary, sent by the African association, in 1788, obtained many particulars from some respectable Mahometans, whose information, however, on some accounts (without impeaching their veracity) is not absolutely to be depended on. The climate of Bornou, according to them, is characterized by excessive, though not by uniform, heat. Two seasons, the one commencing soon after the middle of April, and the other at the same period in October,

may be said to divide the year. The first is introduced by violent winds, that bring with them, from the S.E. and S. an intense heat, with a deluge of sultry rain, and such tempests of thunder and lightning as destroy multitudes of the cattle and many of the people. At the commencement of the second season, the ardent heat subsides; the air becomes soft and mild, and the weather perfectly serene. The complexion of the natives is black; but they are not of the negro cast. The dress of the greater part consists of shirts of blue cotton manufactured in the country, of a red cap imported from Tripoli, and a white muslin turban from Cairo. Note-rings of gold are worn by the principal people. But the only covering of the poorer sort, is sometimes a kind of girdle for the waist. They cultivate two kinds of Indian corn, the horse-bean of Europe, the common kidney-bean, cotton, hemp, and indigo. The hoe is used in tillage; the plough being unknown. While the men, with their hoes, form the trenches in straight parallel lines, the women follow and throw in the seed; but the latter take the hoe when the weeds begin to appear. They have neither olives nor oranges, but few figs, and no good apples, plums, or dates; but they have abundance of grapes, apricots, pomegranates, lemons, limes, and melons. The most valuable tree is called *Redeynah*, in form and height like an olive, the leaf resembling that of a lemon, and bearing a nut, both the kernel and shell of which are in great estimation; the first as a fruit, the last on account of the oil it produces when bruised. Horses, asses, mules, dogs, horned cattle, goats, sheep, and camels (of the flesh of which they are very fond), are the common animals of the country; but they have no oxen. Their hives of bees are so numerous, that the wax is often thrown away as an article of no value. Their game consists of the huadde, and other species of antelopes, the partridge, wild duck, and ostrich, the flesh of which they prize above every other. Their other wild animals are the lion, leopard, civet cat, wolf, fox; the wild dog, that hunts the antelope; the elephant, which is not common, and of which they make no use; the camelopardalis, crocodile, and hippopotamus. They are much infested with snakes, scorpions, centipedes, and toads. In some parts, particularly the mountainous, the herdsmen prefer a residence in tents to stationary dwellings. More than thirty different languages are said to be spoken in Bornou and its dependencies. The reigning religion is the Mahometan. Their monarchy is elective. On the death of the sovereign, the privilege of choosing a successor, from among his sons, without regard to primogeniture, is conferred on three of the most distinguished men, whose age and character for wisdom are denoted by their title of elders. These retire to a sequestered place, the avenues to which are carefully guarded; and, while their deliberations last, the princes are closely confined in separate chambers of the palace. Their choice being made, they proceed to the apartment of the sovereign-elect, and conduct him, in silence, to the gloomy place, where the unburied corpse of his father, that cannot be interred till the conclusion of this awful ceremony, awaits his arrival. There the elders expatiate to him on the virtues and defects of his deceased parent; describing, with panegyric or censure, the measures that exalted or sunk the glory of his reign. "You see before you," say they, "the end of your mortal career: the eternal, which succeeds it, will be miserable or happy, in proportion as your reign shall have proved a curse or a blessing to your people." The present sultan (in 1788) is a man of unostentatious appearance; undistinguished, in his dress, from his subjects. But he is said to have 500 ladies in his seraglio, and to be the reputed father of 350 children, of whom 300 are males: a disproportion which naturally suggests the idea, that the mother, preferring the joy of being the supposed parent of a future candidate for the

empire to the gratification of natural affection, sometimes exchanges her female child for the male offspring of a stranger. His fluid likewise contains 500 horses. He has a vast army, which consists almost entirely of horse. Fire-arms, though not unknown to them, they neither use nor possess. The fabre, lance, pike, and bow, are their weapons of offence, and a shield of hides is their armour. In their manners the people are courteous and humane. They are passionately fond of play; the lower classes of draughts; while the higher ranks excel in chess. Their capital is of the same name.

BORNOU, the capital of the empire of Bornou in Africa, situated in a flat country, on the banks of a small river. According to the information obtained by Mr. Lucas, it is of greater extent than Tripoli, but consisting of a multitude of houses, so irregularly placed, that the spaces between them cannot be called streets. Their mosques are constructed of brick and earth; and they have schools, in which the koran is taught, as in the principal towns of Barbary. The royal palace, surrounded by high walls, and forming a kind of citadel, is built in a corner of the town. The houses of the inhabitants are neatly plastered, both within and without, with clay or mud, and are similar in form to those of Tripoli. Bornou is surrounded by a wall, and is 650 miles S.E. of Mourzook. Long. 27. 30. E. Lat. 19. 40. N.

BOROMÆUS (Frederic), cardinal and archbishop of Milan. He, in 1609, celebrated the council of Milan. He founded the Ambrosian library, which he enriched with 9000 manuscripts. He left several works behind him, and died in 1632.

BORONDON (St.), an island in the Atlantic Ocean, mentioned by some writers, particularly Linfchotten, in their description of the Canary islands, as something supernatural. It is said to be about 100 leagues distance from Ferro, probably west, though no writer has pretended to lay down its exact situation. Here it is affirmed several ships have touched by accident, and all agree in their relations of the state of the inhabitants and island. They affirm, that it is perpetually clothed with a great variety of wood, chiefly fruit-trees: that the valleys are in a perpetual state of verdure; and continually decked with flowers, grass, and plants, the spontaneous productions of the earth; or with corn and pulc, cultivated with great care by the inhabitants: that the soil is so prolific as to raise large quantities of corn for exportation; and that the ships that call here never fail of meeting with refreshments of every kind. It is said to be peopled by Christians, who have a language of their own, apparently combined of a variety of modern languages; for, say they, whoever understands the European tongues may make shift to hold conversation with this people. It is remarkable, that no ships, expressly sent upon this discovery, were ever fortunate enough to fall in with the island of St. Borondon, though the Spaniards have several times attempted it from the Canaries. Hence it has been called the *marvellous island*; and hence indeed we may conclude, either that it exists wholly in imagination, or at least that it is surrounded with such currents as insensibly carry ships out of their course, and prevent their meeting with it. Some writers affirm that it actually disappears upon certain occasions, and shifts its position; while others, with more appearance of truth, allege, that it is frequently overcast with thick and impenetrable clouds, which occasion the disappointment of all the adventurers who have gone in search of it.

BORRICHIUS, one of the most learned men of his age, the son of a Lutheran minister in Denmark, was born in 1626. He applied himself to physic in the university of Copenhagen, and began to practise during a most terrible plague that made great havoc in that city. He travelled: but before his departure, in 1660, he was appointed professor in

poetry, botany, and chemistry; and at his return discharged his duties with great assiduity, of which the works he published afford full proof. He was raised to the office of counsellor in the supreme council of justice in 1686; to that of counsellor of the Royal Chancery, in 1689; and died of the operation for the stone, in 1690. He published, 1. *Lingua pharmacopæorum*; 2. *Disertationes de poeticis Græcis et Latinis*; 3. *De ortu et progressu chemie*: and several other works.

BORROWDALE, a district in the S. part of Cumberland, on the borders of Westmorland. It is a dreary region, abounding, beyond any other part of the world, with the finest sort of that valuable and singular mineral, black-lead or wad; the mines of which are only opened at intervals, and then carefully closed again, lest this precious substance should become too common. Copper, lead, and calamine, are also found in this tract.

BORROWSTONESS. See **BURROWSTONESS**.

BORZONI (Luciano), a Genoese historian and portrait-painter of great genius and abilities, flourished about the middle of the 17th century. His three sons were professors of the same art: but only one, Francis Maria, succeeded; and that was in fee-pieces, particularly forms.

BOS (John Baptist du), a celebrated author and member of the French Academy, was born at Beauvais in 1670, and finished his studies at the Sorbonne. In 1695 he was made one of the committee for foreign affairs under Mr. Torcy; and was afterwards charged with some important transactions in England, Germany, Holland, and Italy. At his return to Paris, he was handsomely preferred, made an abbé, and chosen perpetual secretary of the French Academy. He was the author of several excellent works; the principal of which are, 1. Critical reflections upon poetry and painting, 3 vols. 12mo. 2. The history of the four Gordians, confirmed and illustrated by medals. 3. A critical history of the establishment of the French monarchy among the Gauls, 2 vols. 4to., 4 vols. 12mo. He died at Paris, on the 23d of March, 1742.

BOSCOBEL, a village of Shropshire, near White Ladies, in the parish of Tongue, noted for the Royal Oak in which Charles II. was concealed, and saw the soldiers pass by in quest of him, after the battle of Worcester. The tree was inclosed by a brick wall, but is now almost cut away by travellers.

BOSCAN (John), a Spanish poet of the 16th century, born at Barcelona. He was the friend of Garcilasso de Vega, another Spanish poet. These two were the first who made any great improvement in the poetry of their nation, and their pieces were printed together. Boscan, who died about the year 1542, principally succeeded in sonnets.

BOSCHARTS (Thomas Vuillebos), a celebrated painter, was born at Bergen-op-zoom; and, like the great painters who flourished at that time, began to draw, when very young, in the books that were intended for other studies. Preferring his pencil to every thing else, he drew his own picture, by his resemblance in a looking-glass, so like, that those who saw it were astonished. This he did before he had the least instruction from any one, and when he was only twelve years of age. Upon this, his parents sent him to a master, that he might follow the bent of his genius; but his first master being only an indifferent painter, and incapable of satisfying his earnest desire of learning, he left him, and engaged himself with Gerard Segers, under whom, after four years' practice, he proved a most accomplished artist. Antwerp being at that time the seat of arts, where there was a conflux of the most eminent painters, he thought it the fittest place for his improvement; and there executed such a number of noble pieces as added greatly to the splendor of that wealthy city. In 1642, Henry Frederick prince of Orange, and his son Prince William, em-

ployed him in their service; in which he continued several years, and made those excellent pieces that are to be seen in that prince's palace at the Hague, and other parts of Holland, and painted portraits for most of the persons of quality that were then living. He died in the flower of his age, in 1670.

BOSSE (Abraham), an able engraver, born at Tours, was well skilled in perspective and architecture. He wrote two treatises, which are esteemed; the one on the manner of designing, and the other upon engraving.

BOSSU (René le), born at Paris in 1631, was admitted a canon regular in the abbey of St. Genevieve, in 1649; and after a year's probation, took the habit. He taught polite literature with great success in several religious houses for 12 years, when he gave up the task for retirement. He then published a parallel betwixt the principles of Aristotle's natural philosophy and those of Des Cartes, with a view to reconcile them; which was but indifferently received. His next treatise was on epic poetry; which Boileau declared one of the best compositions on that subject in the French language, and which produced a great friendship between them. He died in 1680, and left a great number of MSS. which are kept in the abbey of St. John de Chartres.

BOSSUET (James Benigne), Bishop of Meaux, was born at Dijon, on the 27th of September, 1627. He distinguished himself by his preaching, and the zeal he discovered in his endeavours to bring over the Protestants of France to the Romish church; by his opposition to Quietism; and by his numerous writings both in French and Latin, which have been collected together, and printed at Paris in 17 vols. 4to. This famous divine died at Paris, in 1704, aged 77.

BOSSUS (Matthew), distinguished by his virtue and his learning, was born in 1427. He devoted himself to the ecclesiastical state in 1451, in the congregation of regular canons of Lateran, and afterwards taught divinity at Padua. His orations, his sermons, and his letters, have often been printed. He also wrote a sort of an apology for Phalaris, and other works. He died at Padua in 1502, aged 75.

BOSWELL (James), an ingenious Scottish writer: He was the son of Alexander Boswell, lord Auchinleck, a judge in the supreme court of session and judiciary, and was born at Edinburgh in 1740. After studying the civil law at Edinburgh and Glasgow, he visited London, where he wished to enter into the army, but his father was inflexibly bent against the measure, being desirous to see his son make a figure at the bar. In compliance with his wish, he went to Utrecht, after which he made the tour of Europe. In 1763 he contracted an intimacy with Dr. Johnson, which lasted till the doctor's death. In 1766 he was admitted an advocate at the Scotch bar. In 1768 he published an Account of Corsica, with Memoirs of General Paoli, which is a curious and well-written book. In 1784 appeared another original work, which had a great run, a Journal of a Tour to the Hebrides with Dr. Johnson, full of anecdote, and highly entertaining. The same year he settled in London, and was admitted at the English bar. In 1790 appeared the work which will secure him a lasting name, the Life of Samuel Johnson, LL.D. This respectable and sensible man died in London in 1795: he had by his lady, who died before him, two sons and three daughters. Mr. Boswell printed several pamphlets and fugitive pieces.

BOTALLUS (Leonard), physician to the duke of Alençon, and to Henry III. was born at Asti in Piedmont. He introduced at Paris the practice of frequent letting of blood; which was condemned by the faculty; but soon after his death it came into practice with all the physicians. He pub-

lished several books in physic and surgery; the best edition of which is that of Leyden in 1660, octavo.

BOTANY (*Encycl.*). In page 48, 25th class, 2d line, for "*spadar*," read "*spadir*."

BOTH (John and Andrew), Flemish painters, and pupils of Bloemart. The union of these brothers was very singular; they were inseparable in their studies, travels, and paintings. John painted the landscape part of their pictures in the manner of Lorrain, and Andrew the figures and animals in the style of Bamboche. They both died in 1650. John's taste in landscape is elegant; his ideas are grand; his composition beautiful; and his execution rich and masterly in the highest degree. His light is not always well distributed; but his figures are excellent. It is to be regretted that we have not more of his works; for they are certainly, upon the whole, among the best landscapes we have.

BOTTRIGARO (Hercole), a person eminently skilled in the science of music, though not a musician by profession. He was a man of rank in Bologna; and appears, from several letters to him that have been printed, to have had the title of *count*. He published several controversial pieces on the subject of music. It seems that he entertained strong prejudices in favour of the ancient music; and that he attempted, as Vincentino and others had done, to introduce the chromatic genus into practice, but with no better success than had attended the endeavours of others. He corrected Gogavino's Latin version of Ptolemy in numberless instances; and that to so good a purpose, that Dr. Wallis has in general conformed to it in that translation of the same author, which he gave to the world many years after. He also translated into Italian *Boetius de Musica*, and as much of Plutarch and Macrobius as relates to music: besides this, he made annotations upon Aristoxenus, Franchinus, Spataro, Vincentino, Zarlino, and Galilei; and, in short, on almost every musical treatise he could lay his hands on, as appears by the copies which were once his own, and are now deposited in many libraries in Italy. Of Bottrigaro's works it is said that they contain greater proofs of his learning and skill in music, than of his abilities as a writer, his style being remarkably inelegant: nevertheless, he affected the character of a poet; and there is extant a collection of poems by him, in 8vo, printed in 1557. Walther represents him as an able mathematician, and a collector of rarities; and says that he was possessed of a cabinet, which the emperor Ferdinand II. had a great desire to purchase. He died in 1609.

BOUCHART, a small town of France, in the department of Indre and Loire, and late province of Touraine. It is situated in a small island of the river Vienne, 15 miles from Tours.

BOUCHET (John), a French poet and historian, flourished in the 16th century. The most considerable of his writings are the *Annals of Aquitaine*, and his *Chapelet des Princes*.

BOUFLERS (Lewis Francis, duke of), a peer and marshal of France, was born in 1644. He distinguished himself by his valour and conduct in several sieges and battles, and had the command of the right wing when the French were defeated at the bloody battle of Malplaquet. He died at Fontainebleau in 1711. Marshal Boufflers, his son, died at Genoa, after having delivered that republic.

BOUGEANT (William Hyacinth), a famous Jesuit, first taught humanity at Caen and Nevers, and afterwards settled at the college of Lewis the Great, where he employed himself in writing several works; the principal of which were, 1. A collection of physical observations, extracted from the best authors; 2. An history of the wars and negotiations

which preceded the treaty of Westphalia; 3. The female doctor, a philosophical amusement on the language of beasts, &c. He died in 1743.

BOUILLE (Marquis de), a celebrated French general, was descended of an ancient and noble family, from whom he inherited an ample patrimony. He received an excellent education, and was no less celebrated for the elegance of his manners than beloved for the goodness of his heart. During the American war he served in the West-Indies, and was appointed commandant of all the French West India islands: he was also advanced to the rank of lieutenant-general, and received the knighthood of the most noble order of the Holy Ghost. In the course of the war, several of the British islands fell under the dominion of the French, and the Marquis de Bouillé was endeared to the vanquished by the suavity of his manners, and the mildness of his sway. At the end of the war, after a short abode in the French metropolis, he came to London, and was received in a most favourable manner by the king; the West-India merchants also paid the homage due to him for the liberality he had shewn when their property was committed to his disposal. He afterwards visited Holland, Prussia, Bohemia, and Vienna, being everywhere received with the confidence due to his rank and talents, and entrusted with the secret of those important plans which, at the moment, agitated the bosoms of all the continental potentates. In the summer of the year 1785, he returned to Prussia, intending to have visited the court of Catherine II., but his journey was delayed by orders for his return to Paris, in consequence of a grand project formed by France and Holland, for an invasion of the British dominions in India, the command of which was to be entrusted to him. The execution of the project was, however, still distant, and the revolution in Holland, in 1787, ultimately prevented its prosecution.

The derangement of the French finances now demanded new and effectual exertions: M. de Calonne, having conceived a wife and just plan for repairing the deficiencies of the revenue, and having secured, as he thought, the necessary co-operation, convoked the *notables* to meet in January, 1787; a measure which had not been recurring to since the year 1625, in the reign of Lewis XIII. It is not necessary here to detail the causes which frustrated Calonne's intentions, and occasioned the dismissal of the notables; M. de Bouillé was one of their number, and, immediately on their dissolution, was appointed commandant of Metz, and of the province *des Evêchés*.

In the year 1788 those measures were pursued which laid the government entirely at the mercy of intriguers, which afforded a pretext for the convocation of the states-general, and for the recall of Necker. This quack-minister thought proper again to convene the *notables*, merely to shew them that he disregarded their advice. M. de Bouillé was again a member of this assembly, and saw with indignation the efforts which were daily used, and generally encouraged, to subvert the ancient constitution of the kingdom. He opposed, in an open and energetic manner, the project of the innovators, detailed the miseries to which they would give birth, and exposed the errors both of Necker and La Fayette in the most perspicuous terms. Alarmed at his firmness, they procured an invitation to be sent to him, through the Baron de Stael, Necker's son-in-law, to accept a command in the service of the king of Sweden, who was then at war with Russia. M. de Bouillé would, with pleasure, have accepted an offer which would have exempted him from witnessing and taking a share in the calamities which he saw ready to burst forth on his country; but was suddenly, in the month of March, 1789, ordered to his government of Metz.

His conduct in this department, at such a critical period, needs no other eulogy than his own inartificial narrative:—"While I commanded at Metz," he says, "not one person was assassinated; property in the towns, as well as in the country, remained inviolate; not a feat was burned, nor any nobleman or landholder exposed to the fury of the people, which evaporated in empty threats. For the first twelve months of the revolution, I was so happy as to preserve, among the twenty thousand men I had under my command, the same temper of mind as formerly." Here he had an opportunity of experiencing the ignorance, or, more properly, the treachery of Necker, who refused an offer which he made to distribute part of the grain in his possession among the people, on condition of its being restored to the garrison at the next harvest.

In this situation M. de Bouillé passed the eventful year 1789, contemplating with horror the progress of the revolution, in which he took no share, though earnestly solicited, and that, under the most plausible pretences, by La Fayette, who was his kinsman, and with whom he had been intimate from his infancy. But M. de Bouillé penetrated into the feeble and crafty character of this vain pretender to superiority in revolutions, and not only avoided a connection with him, but with every other political party which had a selfish view, derogatory to the true constitution of French government: he declared with honest magnanimity, "I am neither aristocrat nor democrat, I am a royalist."

But the efforts of the king's real friends received a fatal impediment from his visit to the assembly on the 4th of February, 1790, when, influenced by the advice of hypocritical traitors, he threw himself into the bosom of that rebellious body, and declared himself the head and protector of that revolution which had already deprived him of the best prerogatives, and his liberty, and was rapidly proceeding in those measures which hurried him to an untimely grave.

The distribution of arms among the populace, and the dissemination of jacobin principles among the soldiery, had already induced most of the commandants of provinces to resign, or to abandon the kingdom. M. de Bouillé, who had long contemplated with confidence the garrison under his command, as a resource for the royal family in the expected extremity, was now convinced no effectual use could ever be made of their services: he exerted himself with effect in maintaining order and quelling insurrection, but earnestly solicited leave to resign, and seek another country. This resolution he was induced to abandon by the king's own request: he took the constitutional oath, and permitted the federation of the national guards in his government with the troops of the line.

Having by these acts, in a certain degree, relinquished the line of conduct which his own principles would have dictated, M. de Bouillé endeavoured to serve the royal cause, as connected with the imaginary, and as yet unfounded, constitution, but in vain. The dissimulation of La Fayette, his folly, which gave a decided ascendancy to the jacobins, rendered all such attempts unavailing; and the troops who had been called to Paris to assist at the absurd ceremony of the confederation, spread anarchy and insurrection in every part of the kingdom. The garrison of Metz, in August, 1790, commenced a most dangerous insurrection, which was with difficulty suppressed; Nancy, in the same month, followed the example: the heroism of Desilles, who opposed his person to a loaded cannon, was insufficient to restrain the popular fury: M. de Bouillé, after essaying, without effect, every conciliatory measure, was reduced to the necessity of employing force, which he was authorized to do by a decree of the assembly; and, after an ob-

inate contest, reduced the insurgents, though not without great slaughter. For this timely effort he was assailed with all the virulence of jacobin vituperation; the ready pens of the Palais Royal were employed in aspersing his character, and the eager echoes of jacobin invention in other countries were prepared to repeat, with atrocious additions, the calumnies derived from that never-failing source. The Orleans faction, who could never forgive this check on their favourite projects, harassed the assembly with perpetual motions on the subject, and essayed all means to obtain the censure of the marquis, in which they were at length successful.

The contents of the various factions who pretended to give laws to France, tended only to one certain end, that of degrading the king, and making him miserable. La Fayette was become his gaoler, and with the office, adopted the manners of a turnkey. Worn out with repeated indignities, which were daily renewed and increased under various pretences, the king resolved to quit the capital, and seek refuge in one of the frontier towns, under the command of M. de Bouillé. Our limits do not allow a recapitulation of the negotiations with Mirabeau; the projects of various individuals; the causes which retarded the king's departure, and occasioned the final frustration of his plan. Throughout this critical emergency, which forms one of the most embarrassing crises of his life, Lewis displayed the utmost integrity of heart and goodness of disposition. M. de Bouillé, failing in all his efforts to secure the retreat of his sovereign, reluctantly secured his own safety by quitting a land which he considered irreparably dishonoured, and where the advantages of birth, fortune, long services, and unshaken loyalty, could no longer secure him an asylum. Still intent on rendering the latest service in his power to the king, M. de Bouillé wrote a letter to the national assembly, avowing himself the sole persuader and contriver of the king's flight, and endeavouring, by every means, to divert the force of popular fury from the king to himself: his efforts were insufficient to save the king; but the demagogues eagerly seized the opportunity of stigmatising a man whom they had long regarded as one of their most formidable enemies. The assembly passed a decree of accusation against him and his son, their estates were confiscated, and the national convention afterwards offered a reward to the man who would assassinate him.

M. de Bouillé, not seeing in the year 1791 any thing which denoted hostile preparations against France, offered his services to the empress of Russia, but being pressed by the king of Sweden, who was then at Aix-la-Chapelle, he accepted a commission in his service. Gustavus and Catherine had formed extensive and beneficial projects relative to France, which were however frustrated, partly by the backwardness of Austria and Prussia, partly by the inflexible neutrality of Great Britain, and finally by the assassination of the king of Sweden.

Soon after this event, M. de Bouillé quitted the service of Sweden. He had now, to use his own expression, connected his fate with that of two sovereigns, equally unfortunate, and henceforth resolved to secure himself from the frowns of Fortune by troubling her no longer. On the preparations in the year 1792 to invade France, he was offered a command of six thousand troops, but pecuniary difficulties prevented the intended arrangement, and he served as a volunteer under the prince of Condé. After the retreat of the allies, he took no public share in military or political transactions.

M. de Bouillé published in the year 1797 his memoirs relating to the French revolution, a work in which the most excellent principles are combined with a clear and ingenious narrative: and in which the author has the singular candour to

review his own conduct with frequent and decided disapprobation.

BOULAY (Cæsar Egasse du), in Latin *Buleus*, was born at St. Ellier, a village of Maine in France; and became professor of humanity at the college of Navarre, regiter, rector, and historiographer of the university of Paris. He died in 1678, after having published several works. The principal of them are, *A History, of the University of Paris*, in Latin, 6 vols. folio; and the *Treasure of Roman Antiquities*, in 1 vol. folio.

BOULTER (Dr. Hugh), was born in or near London, of reputable and wealthy parents. He was educated at Merchant-tailors' school; and, before the revolution, was from thence admitted a commoner of Christ-church in Oxford. Some time after, he was chosen a demy of Magdalen College, at the same election with Mr. Addison and Dr. Wilcox. From the merit and learning of the persons elected, this was commonly called by Dr. Hough, president of the college, the *golden election*. He afterwards became fellow of the same college; in which station he continued in the university till he was invited to London by Sir Charles Hodges, principal secretary of state, in the year 1700, who made him his chaplain, and recommended him to Dr. Tenison archbishop of Canterbury; but his first preferments were owing to the Earl of Sunderland, by whose interest and influence he was promoted to the parsonage of St. Olave in Southwark, and the archdeaconry of Surrey. Here he continued discharging very faithfully and diligently every part of his pastoral office, till he was recommended to attend George I. as his chaplain, when he went to Hanover in 1719. He had the honour to teach Prince Frederick the English language; and by his conduct he so won the king's favour, that he promoted him to the deanery of Christ-church, and the bishopric of Bristol, in the same year. As he was visiting his diocese five years afterwards, he received a letter from the secretary of state, acquainting him that his majesty had nominated him to the archbishopric of Armagh and primacy of Ireland. This honour he would gladly have declined; and desired the secretary to use his good offices with his majesty to excuse him from accepting it. Ireland happened to be at this juncture in a great flame, occasioned by Wood's ruinous project; and the ministry thought that the bishop would greatly contribute to quench it by his judgment, moderation, and address. The king therefore laid his absolute commands upon him: to which he submitted, but with some reluctance. As soon as he had taken possession of the primacy, he began to consider that country, in which his lot was cast for life, as his own; and to promote its true interest with the greatest zeal and assiduity. Accordingly, in innumerable instances, he exerted himself in the noblest acts of beneficence and public spirit. His charities for augmenting small livings and buying glebes amounted to upwards of 30,000*l.*, besides what he devised by will for the like purposes in England. In short, the instances he gave of his generosity and benevolence of heart, his virtue, his piety, and his wisdom, are almost innumerable, and the history of his life is his noblest panegyric. This excellent prelate died at London, on the 2d of June, 1742; and was interred in Westminster-abbey, where a beautiful monument of finely polished marble is erected to his memory.

BOURBON (Nicholas), a famous Latin poet in the 16th century, was a native of Vandeur near Langres, and the son of a wealthy man who was master of several forges. Margaret de Valois appointed him preceptor to her daughter Jane d'Albert of Navarre, the mother of King Henry IV. At length he retired to Condé, where he had a benefice, and died about the year 1550. He wrote eight books of Epigrams; and a

poem on the forge, which he has entitled *Terraria*. He had great knowledge of antiquity and of the Greek language. Erasmus praises his epigrams.

BOURBON (Nicholas), a celebrated Greek and Latin poet, was nephew of the preceding. He taught rhetoric in several colleges of Paris; and the Cardinal de Perron caused him to be nominated professor of eloquence in the Royal College: he was also canon of Langres, and one of the 40 of the French academy. At length he retired to the fathers of the Oratory, where he died in 1644, aged 70. He is esteemed one of the greatest Latin poets France has produced. His poems were printed at Paris in 1630.

BOURCHIER (John), lord Bemars, grandson and heir of a lord of the same name, who was descended from Thomas of Woodstock, duke of Gloucester, and had been knight of the Garter, and constable of Windsor-castle, under Edward IV. Our Lord John was created a knight of the Bath at the marriage of the Duke of York, second son of Edward IV., and was first known by quelling an insurrection in Cornwall and Devonshire, raised by Michael Joseph, a blacksmith, in 1495, which recommended him to the favour of Henry VII. He was captain of the pioneers at the siege of Therouenne, under Henry VIII., by whom he was made chancellor of the exchequer for life, lieutenant of Calais and the Marches, appointed to conduct the lady Mary the king's sister into France on her marriage with Lewis XII., and had the extraordinary happiness of continuing in favour with Henry VIII. for the space of 18 years. He died at Calais in 1532, aged 63. He translated, by King Henry's command, Froissart's Chronicle; which was printed in 1523, by Richard Pynson, the scholar of Caxton, and the fifth on the list of English printers. His other works were a whimsical medley of translations from French, Spanish, and Italian novels, which seem to have been the mode then, as they were afterwards in the reign of Charles II. These were, *The life of Sir Arthur, an Armoric knight*; *The famous exploits of Sir Hugh Bourdeaux*; *Marcus Aurelius*; and *The castle of love*. He composed also a book, *Of the duties of the inhabitants of Calais*; and a comedy entitled *Ite in Vincam*, which is mentioned in none of our catalogues of English plays. Anthony Wood says it was usually acted at Calais after vespers.

BOURDALOUE (Lewis), a celebrated preacher among the Jesuits, and one of the greatest orators France has produced, was born at Bourges, on the 20th of August, 1632. After having preached at Provence, he, in 1699, went to Paris; and there met with such applause, that the king resolved to hear him: on which he was sent for to court, and frequently preached before Lewis XIV. He assisted the sick, visited the prisons and hospitals, and was very liberal in giving alms. He died in Paris on the 13th of May, 1704. The best edition of his sermons is in octavo.

BOURMONT, a town of France, in the department of Upper Marne, and late province of Champagne, 22 miles from Chaumont. Long. ϵ . 43 E. Lat. 48. 14 N.

BOURTON-ON-THE-HILL, a village of Gloucestershire, on the side of a hill, with a fine prospect into Oxfordshire. There are two springs in this parish, one of which runs E. and empties itself into the Thames, and the other W. into the Severn. It is five miles from Stow, and 30 from Gloucester.

BOURTON-ON-THE-WATER, a village, about a mile from the preceding place, and near the Roman Foss; it is watered by a river that rises near it, which here spreads 30 feet wide, over which is a stone bridge, beside several others of wood at proper distances. It has many good houses and a tolerable trade. Adjoining to it is a quadrangular Roman camp, inclos-

ing 60 acres, now divided into 20 fields, where coins and other antiquities are dug up.

BOUSSAC, a town of France, in the department of Creuse and late province of Marche, with a castle, on an almost inaccessible rock, 25 miles N.E. of Gueret.

BOXHILL, a hill near Dorking, in Surrey, celebrated for its extensive prospects. It received its name from the box trees planted on the south side of it, by the Earl of Arundel, in the reign of Charles II.

BOXHORNIUS (Marc Zuerius), a learned critic, born at Bergen-op-Zoom in 1612, was professor of eloquence at Leyden, and at length of politics and history in the room of Heinfius. He published, 1. *Theatrum urbium Hollandiæ*. 2. *Scriptores historiæ Augustæ, cum notis*. 3. *Poetæ satyrici minores, cum comment.* 4. Notes on Justin, Tacitus: and a great number of other works. He died in 1653, aged 41.

BOXLEY, a village in Kent, a little to the east of Pinnerden Heath, near Maidstone; famous for an abbey of Cistercian monks, founded by William earl of Kent in 1146, the remains of which still exist. It was during his residence in this abbey that Edward II. granted the charter to the city of London, empowering them to elect a mayor from their own body. This abbey was also famous for the wooden figure, called the Rood of Grace; the lips, eyes, and head of which moved on the approach of its votaries. It was broken to pieces, at St. Paul's Cross, in 1538, by Hilsey bishop of Rochester, who shewed to the credulous people the springs and wheels by which it had been secretly moved.

BOYD (Mark Alexander), an extraordinary genius, was son of Robert Boyd, who was eldest son of Adam Boyd of Pinkhill, brother to Lord Boyd. He was born in Galloway on the 13th of January, 1662, and came into the world with teeth. He learned the rudiments of the Latin and Greek languages at Glasgow under two grammarians; but was of so high and intractable a spirit, that they despaired of ever making him a scholar. Having quarrelled with his masters, he beat them both, burnt his books, and forswore learning. While he was yet a youth, he followed the court, and did his utmost to push his interest there; but the fervour of his temper soon precipitated him into quarrels, from which he came off with honour and safety, though frequently at the hazard of his life. He, with the approbation of his friends, went to serve in the French army, and carried his little patrimony with him, which he soon dissipated at play. He was shortly after routed by that emulation which is natural to great minds, and applied himself to letters with unremitting ardour, till he became one of the most consummate scholars of his age. He is said to have translated Cæsar's Commentaries into Greek in the style of Herodotus, and to have written many Latin poems which were little inferior to the first productions of the Augustan age. He also left several manuscripts on physiological, political, and historical subjects, in Latin and French, which languages were as familiar to him as his native tongue. He could with facility dictate to three amanuenses at the same time, in different languages and on different subjects. He was also one of the best Scottish poets of the age. To all this we must add, that his personal beauty and accomplishments were equal to his mental superiority. He died at Pinkhill in Scotland, in 1691. The following works, which are all that have been printed, were published in the *Deliciæ Poetarum Scotorum*; Amstel. 1637. 12mo.: 1. *Epigrammata*, lib. ii. 2. *Heroïdum Epistolæ* XIV. lib. i. 3. *Hymni* XIV.

BOYLE (John), earl of Cork and Orrery, a nobleman distinguished by his learning, and genius, was the only son of Charles earl of Orrery, and was born on the 2d of January, 1707. He was educated at Christ-church College in Ox-

ford; but, as he himself declares, early disappointments, indifferent health, and many untoward accidents, rendered him fond of retirement, and of improving his talents for polite literature and poetry; of which last art he gave several excellent specimens. He also wrote a Translation of Pliny the Younger's letters, with various notes, for the service of his eldest son the Lord Boyle, in two volumes 4to. This was first published in 1751. The year following he published the Life of Dean Swift, in several letters, addressed to his second son Hamilton Boyle; and afterwards printed Memoirs of Robert Cary earl of Monmouth, a manuscript presented to him by a relation, with explanatory notes. He died in 1762.

BOYOLO, a town of Italy, in the duchy of Mantua, capital of a territory of the same name, subject to the house of Austria. It is fifteen miles S. W. of Mantua. Long. 10. 35. E. Lat. 45. 6. N.

BOYSE (Samuel), an English poet of some merit, but more worth recording as an example of the extreme distress consequent upon vice and folly in a literary character, was the son of the Reverend Joseph Boyse, a dissenting minister of eminence in Dublin. He was born in 1708; and after receiving his school education in his native city, he was sent to the university of Glasgow. Here his studies were interrupted by a love affair with the daughter of a tradesman in the place, as thoughtless as himself, whom he married before he reached his twentieth year. He took his wife and her sister to Dublin, and lived a dissolute life at his father's expence, till the death of this unfortunate parent. He then removed to Edinburgh, where in 1731 he published a volume of poems, which gained him reputation, and the patronage of some persons of rank; but a radical meanness of character, and fondness for low company and pleasures, prevented him from obtaining any solid advantages from the favour he acquired by his talents. On his removal to London, however, he carried with him recommendatory letters from the Dukes of Gordon and Lord Stormont, to Mr. Pope, the lord chancellor, and other persons of consequence; but his negligence and misconduct ruined every prospect. His talents, indeed, were merely those of a writer, and he was totally unfit to make his way by the powers of conversation, or any other mode of ingratiating himself with the respectable part of society. He soon fell into a state of extreme indigence, which he relieved as long as he could by begging with shameless importunity from the principal dissenters, and others to whom his father's name was known. What he obtained in this manner he squandered in selfish luxury, leaving his wife and child to starve at home. His industry was exerted in writing verses for the magazines, which he did with great facility, and for wretched pay. He pawned all his clothes, and even the sheets of his bed; and the manner in which at this period he courted the muse is thus described by an eye-witness: "He sat up in bed with the blanket wrapt about him, through which he had cut a hole large enough to receive his arm; and placing the paper on his knee, scribbled in the best manner he could the verses he was obliged to make." *Cibber, Lives of the Poets.* When he again appeared abroad, he occasionally supplied the want of a shirt by slips of white paper round his wrists and neck. Besides his poetry, he was employed in translating from the French, which he was capable of performing well; but it was his constant practice, after sending a sheet to the press, to pawn the original, and to repeat this as often as it was redeemed during the course of his work. Thus past his wretched and profligate life, in the vicissitudes of spunging-houses, garrets, and ale-houses. One of its principal changes was a residence

at Reading in 1745, on the invitation of Mr. D. Henry, proprietor of the Gentleman's Magazine, for the purpose of compiling an historical work on the events in Europe from the commencement of the Spanish war in 1739 to the rebellion in Scotland. Here his wife died, and he seems to have been reclaimed to a state of somewhat more decent manners and conduct. Indeed, the original impressions of a religious education were never effaced in him, and they aggravated the miseries of his life by the remorse with which his vicious indulgences were ever followed. He returned to London in declining health, married a second time a woman in low life, and died in May 1749, in obscure lodgings in Shoe-lane. His funeral was at the parish expence.

Boyse's poetical effusions, if collected from the periodical works, &c. in which they were inserted, would make several volumes; but this labour is certainly what they are not entitled to. A collection in two volumes was published during his life, but probably with little success. By much the most celebrated of his works is "Deity," a religious poem, probably first published about 1741. This was publicly praised by two very different writers: Harvey in his Meditations, and Fielding, in his Tom Jones; and it attracted notice enough to have passed through three editions in 1752. It is a piece without much plan or connection, but profuse in the splendid thoughts and images which belong to the subject, and generally harmonious and poetical in its diction, though with frequent inequalities. Boyse himself used to relate, that Pope, on being asked if he were not the author of it, disclaimed the work, but said there were many lines in it of which he should not be ashamed. Indeed, the style and versification seemed formed on that poet's manner, though certainly with very inferior powers. His other productions have a like mixture of poetical fancy and elevation with flatness and inaccuracy. The best of them are admitted into a very comprehensive collection of the poets of Great Britain, printed at Edinburgh, with biographical prefaces by Dr. Anderson. In Ogle's Canterbury Tales of Chaucer modernized, several appear under Boyse's name, and are executed with spirit.—We are indebted to the popular biographical work of Dr. Aikin for the foregoing particulars.

BRAAN, a river of Scotland, which descends from the hills of Perthshire, E. of Loch Tay, and falls into the Tay a little above Dunkeld. Upon this river is a grand scene, at a place called the Rumbling Bridge. Under an arch, thrown over a narrow chasm, between two projecting rocks, which almost meet, the whole waters of the river are precipitated in a fall of nearly fifty feet.

BRADESLEY, or BADESLEY, a village near Bromsgrove, in Worcestershire, where are the ruins of a superb abbey, founded by the Empress Maud, mother of Henry II.

BRADFORD (John), a divine, and martyr to the reformation, was born in the former part of the reign of Henry VIII. at Manchester in Lancashire. Being a remarkable penman and accountant, he became secretary to Sir John Harrington, who was several times employed by King Henry and his successor Edward VI. as paymaster to the troops abroad. Bradford at this time was a gay man, and to support his extravagance made free with the king's money; but being at last unable to support the reflection of his guilt, he determined to make restitution, and actually repaid the money. Quitting his employment of secretary, about the year 1547, he took chambers in the Inner Temple, and for some time studied the law; but finding in himself an inclination to preach the gospel, in the following year he removed to Catharine-hall in Cambridge, where he

applied with such uncommon assiduity to the study of divinity, that in a much shorter time than usual he was admitted to the degree of master of arts, and soon after made fellow of Pembroke-hall, Bishop Ridley, who, in 1550, was translated to the see of London, charmed with Bradford's application and zeal, now sent for him to the metropolis, ordained, and appointed him his chaplain. In 1553 he was also made chaplain to Edward VI. during which time he became one of the most popular preachers in the kingdom. Such a reformer was too dangerous to be suffered in the succeeding reign. Mary was hardly in possession of the crown, before Bradford's persecution began. He was first confined in the Tower for sedition, where he continued a year and a half; during which time he wrote several epistles that were dispersed in various parts of the kingdom. He was afterwards removed to other prisons, and at last brought to his trial before that infernal court of inquisition in which Gardiner sat as chief inquisitor, where he defended his principles to the last, in contempt of their utmost power. They condemned him to the flames; and he was accordingly burnt alive in Smithfield, on July 1, 1555. His works are: 1. Seventy-two letters, written to various people, whilst the author was in prison; printed in Bishop Coverdale's collection. 2. Ten letters, printed in Fox's acts and monuments. 3. Complaint of verity, 1559, 8vo. 4. Three examinations before the commissioners, and his private talk with the priests, with the original of his life, 1561, octavo. 5. Two notable sermons, 1574, octavo, 1631. 6. Godly meditations and prayers, 1614, 24to. 7. Treatise of repentance, 1622. With several translations and other pieces.

BRADSHAW (Henry), a Benedictine monk, was born at Chester, about the middle of the fifteenth century. Discovering an early propensity to religion and literature, he was received while a boy into the monastery of St. Werberg in that city; and having there imbibed the rudiments of his education, he was afterwards sent to Gloucester College, in the suburbs of Oxford, where for a time he studied theology with the novices of his order, and then returned to his convent at Chester; here, in the latter part of his life, he applied himself chiefly to the study of history, and wrote several books. He died in the year 1513, the fifth of Henry VIII. His poetry is not inferior to that of any of his contemporaries. His works are: 1. *De antiquitate et magnificentia urbis Eboracæ*. 2. *Chronicon*. 3. The life of the glorious virgin of St. Werberg. Printed Lond. 1521, 4to, in verse. The life of St. Werberg makes only part of this work; for it contains also a description of the kingdom of Mercia, life of St. Etheldred, the life of St. Sexburg, the foundation and history of Chester, and the chronicles of some kings. Possibly this work may include the two first. Bishop Tanner says, that he wrote a chronicle in English verse, extracted from Bede, Malmibury, Geraldus, and others. Probably this is the chronicle above mentioned.

BRADWARDIN (Thomas), archbishop of Canterbury, was born at Hartfield in Suffex, about the close of the thirteenth century. He was educated at Merton College, Oxford, where he took the degree of doctor of divinity; and acquired the reputation of a profound scholar, a skilful mathematician, and consummate divine. Authors are not agreed as to his first preferences. Pitts says he was professor of divinity at Oxford. They agree, however, in asserting, that from being chancellor of the diocese of London, he became a courtier and confessor to Edward III. whom he constantly attended during his war with France, assisting that victorious prince with his advice, animating the troops, and fervently praying for their success. After his return

from the war, he was made prebendary of Lincoln, and afterwards archbishop of Canterbury. He died at Lambeth in the year 1349, forty days after his consecration; and was buried in St. Anselm's chapel, near the south wall. His works are: 1. *De causa Dei*, printed in London, 1618, published by J. H. Savil. 2. *De geometria speculativa*, &c. Paris, 1495, 1512, 1530. 3. *De arithmetica practica*, Paris, 1502, 1512. 4. *De proportionibus*, Paris, 1495, Venice, 1505, folio. 5. *De quadratura circuli*, Paris, 1495, folio.

BRADY (Robert), born in Norfolk in 1643, was master of Caius College, Cambridge, regius professor there, and twice representative of that university in parliament. In 1685 he was made keeper of the records in the Tower, and was physician in ordinary to James II. He wrote, *An introduction to the Old English history*; *An history of England, from the time of the Romans, to the end of the reign of Richard II.*; and, *A treatise on English boroughs*. He died in 1700.

BRALLA, a town of Turkey in Europe, in Walachia, on the Danube. It has a castle, taken by the Russians in 1711; but afterwards restored.

BRALIO, a lofty mountain of the Alps, in the country of the Grisons. It separates the valley of Munster from the county of Bormio; and this part of the Alps is supposed to be the same which Tacitus mentions under the name of Jura Rhaetica.

BRAMHALL (Dr. John), archbishop of Armagh, was born of an ancient family at Pontefract in Yorkshire, about the year 1593. He was invited over to Ireland by the Lord-deputy Wentworth; and soon after obtained the archdeaconry of Meath, the best in that kingdom. In 1634 he was made bishop of Londonderry, which see he improved very much; but the greatest service he did to the church of Ireland, was by getting, with the deputy's assistance, several acts passed for abolishing fee-farms, recovering impropriations, &c. by which and by other means he regained to the church in the space of four years 30,000 or 40,000 l. a-year. In the convocation he prevailed upon the church of Ireland to unite in the same faith with the church of England, by adopting the thirty-nine articles of that church; and would willingly have introduced the English canons, but could only prevail on their accepting such as they deemed proper. Articles of treason were exhibited against him in the Irish parliament; and at the treaty of Uxbridge in 1644, the English parliament made it a preliminary article, that Bishop Bramhall, with Archbishop Laud, and others, should be excepted from the general pardon. He went abroad; but on the restoration was appointed archbishop of Armagh, primate and metropolitan of all Ireland, and was chosen speaker of the House of Lords. He died in 1663; and was the author of several works, which are collected in one volume folio.

BRAMPTON, a village in Herefordshire, one mile S. of Ross. Here are the ruins of a magnificent castle; and the gatehouse, which is entire, is a very curious structure.

BRAN (*Encycl.*) The scarcity of bread which has occurred of late years has led to many important experiments and discoveries. One of these is, that bran contains a very large portion of what is nutritious in wheat. The advantages to be derived from kneading flour for baking with bran-water instead of common water, were first made public in the following copy of a letter from the reverend Francis Haggitt, prebendary of Durham, to the lord bishop of Durham, dated Nuneham, February 18, 1800.

"If you were surprised, my lord, at receiving from me a

loaf of bread, your surprise will cease when I explain my reason for lending it; in doing which, I must enter into some details which, I am persuaded, will be far from uninteresting to your lordship. In the course of reading an old work of Rural Economy, I lately met with the following assertion, viz. that flour kneaded with bran-water will produce a more *substantial* bread, and a *greater quantity* of it, than is obtained by the common mode of baking. As the author says nothing more upon the subject, I conclude he wrote in a time of plenty; but the information (if it should prove correct) appeared to me of vast importance in these days of scarcity, and I determined to make the experiment without delay. Accordingly I caused four bushels of wheat (nine-gallon measure) to be ground, and nothing but the coarse bran taken out: the produce was four bushels and a half of flour, and 22 lb. of bran. About ten days ago, I boiled some of the bran, and kneaded a due proportion of the flour with the strained liquor, and the result of the experiment was so highly satisfactory, that I resolved to repeat it with the most strict attention, and the most scrupulous exactness. The details of this second experiment I am now about to communicate to your lordship; and I thought proper to send you also some of the bread produced by it, that you might form a judgment of its excellence. Yesterday I took 5 lb. of bran, boiled it, and with the liquor strained from it kneaded 56 lb. of flour, adding the usual quantity of salt and yeast. When the dough was sufficiently risen it was weighed, and divided into loaves; the weight, before being put into the oven, being 93 lb. 13 oz., or about 8 lb. 10 oz. more than the same quantity of flour kneaded in the common way; it was then baked two hours, and, some time after being drawn, the bread was weighed, and gave 83 lb. 8 oz.—loss in baking 10 lb. 5 oz. The same quantity of flour kneaded with common water loses about 15 lb. 11 oz. in the baking, and produces only 69 lb. 8 oz. of bread;—gain by my method 14 lb.; that is, a clear increase of one-fifth of the usual quantity of bread from a given quantity of flour. This increase, which at first appears astonishing (since only 5 lb. of bran were boiled), seems to depend on a combination of three causes;—first, the water in which the bran is boiled weighs half a pound more per gallon than plain water; secondly, owing to its glutinous consistence, it is less subject to evaporation by heat; thirdly, and principally, a greater quantity of it is necessary to make the dough; a bushel (or 56 lb.) of flour requires three gallons (i. e. 27 lb.) of plain water; but it imbibes three gallons and three quarts of bran-water, weighing 35 lb. 10 oz. The bran, after being used in this way, is equally fit for many domestic purposes, and I suspect even more nutritious for pigs and poultry than if given to them raw. I had the curiosity to weigh it after the liquor was strained off, and found that it had gained 12 lb. and if water incorporates with it in the same manner as it does with rice, why may not its nutritive power be increased in the same manner? The conjecture accords, at least, with Count Rumford's principle. But to return to my experiment: I have amused myself with the following calculation, which perhaps will make your lordship smile. The increase of bread, by this method, being a fifth from a given quantity of flour, the consumption of flour would be saved by it every sixth day, or sixty days in a year. Supposing then that the practice were universally adopted, and taking the consumption of flour in this kingdom at 200,000 bushels per day, the *annual saving* would amount to twelve millions of bushels, which, at the present price, would cost about ten millions sterling, and in ordinary times about four millions. Of the wholesomeness of the bread there can be no doubt;

of its flavour you will judge by the specimen I have sent you; and I can add from experience, that it keeps very well. After my *first* batch had been baked ten days, I put a loaf which remained of it into my oven for about twenty minutes, and, being suffered to grow cool again, it was cut, and had every appearance of new bread; nay, we even thought it better than it was at first. I am," &c.

This was published by the society for bettering the condition of the poor in London, but as the trials of this method fell short in some instances, it was followed by these "curatory observations on the use of bran in making bread."

"Most of the objections to the use of bran in the making of bread, appear to be founded on a presumption, that no mode of preparation will make any difference in the degree of nutriment to be derived from food. Though the subject is as yet but little understood, still we have gone far enough to ascertain the fact, that in most kinds of grain, some increase of the ordinary nutritive power may be produced by culinary process. The very making bread affords an example of this increase. In rice it is very great; and in barley-meal, particularly when used in soup, its increased power of nutriment may be extended to a surprising degree. It is now well known that rice, when increased by water to a solid substance of five times its original weight, or by the addition of milk to eight times what it originally weighed, is converted from a hard indigestible grain into a wholesome nourishing food.

"It appears from chemical experiments, and particularly from those made by a very able man, the late Dr. Anderson, the minister's father, and mentioned in the House of Commons, that wheat contains 'an essential oil of a most beneficial quality; and that *almost the entire of the oil is confined to the BRAN.*' These words are copied from the account given in the public papers, with a view of suggesting to the reader's mind, whether (if we can be persuaded that the result of these chemical experiments is just, and that there really is a *very nutritious essential oil in the bran* of wheat) that circumstance alone will not at once explain the cause of the increase, and demonstrate the value of the discovery.

"The use and application of Mr. Haggitt's process is now considerably extended, by the addition of the whole of the boiled bran to the dough. This has been adopted, for the last month, in some families, in the making of all their bread for common use; and the bread so made is perfectly good and sweet, and (as far as one may at present judge) quite as *wholesome and nourishing* as any other bread.

"The fact seems to be, that the boiling of the bran softens it, and divests it of its dry husky quality; thus preparing the nutritive part, the *essential oil*, for food. The increase in the quantity of bread by the addition of bran to 56 lb. of flour, is from 34 lb. to 36 lb. of bread beyond what is produced in the common mode. In one instance, the 56 lb. of flour with 14 lb. 14 oz. of bran, has produced 106 lb. and a half of bread, weighed the next day when cold; above half as much again as what is commonly made, and about twice the quantity that is produced from a bushel of wheat when merely the fine white flour is used. This improvement (if adopted only in the families of gentlemen and farmers, and in public institutions) would have an instantaneous effect in reducing the price of flour, and in baffling the arts of the *speculator*; and if universally adopted throughout the whole kingdom, the saving from it would be equal to one-third of our consumption; or to the annual amount of as much wheat as, with the same economy, would supply the whole kingdom for six months;—of as

much wheat as one thousand ships would import to our shores, if the rest of Europe were glutted with grain, and the millions which it would cost were no object of expenditure.

"There is not the most distant idea of pressing upon the poor any variation in their habits; particularly with respect to bread, now become their chief article of subsistence. But it is conceived, that, in the present crisis, the rich are *inexcusable*, if they neglect to attend to every practicable saving that can be made in the consumption of wheat corn. Whether the high price of bread is occasioned by actual scarcity, or by baneful monopoly, or whether (as some think) it owes its existence to both causes, it is one of our first duties to adopt every just and legal expedient to keep down the price of corn, and to husband this essential article of life for the benefit of our poor and necessitous brethren. Something has been already done, and with great and good effects: but it is hardly possible to conjecture what the price of bread would have been at this day, and how insupportable might have been the pressure upon the poor, if no measures had been taken for their relief and protection. When, therefore, we find any persons openly opposing those measures, or clandestinely endeavouring to diminish their effects, it is not very easy to divest the mind of the idea, that they have an interest in the increase of the evil, and are taking advantage of a public calamity."

BRANCASTER, a village of Norfolk, to the E. of the promontory of St. Edmund's-chapel, was anciently Brano-dunum, a considerable Roman city, where ancient coins have been frequently dug up.

BRANDELS, a town of Bohemia, on the river Elbe, 10 miles N. E. of Prague. Long. 14. 45. E. Lat. 50. 15. N.

BRANDT (Gerard), a learned divine of the reformed religion, was born at Amsterdam in 1626, and was successively minister in several places of the Netherlands. He wrote some works which are esteemed, particularly *The History of the Reformation of the Netherlands*, 4 vols. 4to.; and *The Life of Admiral Ruyter*; both written in the Flemish tongue. He died at Rotterdam in 1685.

BRASSA, a small island to the N. of Scotland, one of the Shetland islands. Between this and the principal island, called the Mainland, is the noted Brassa Sound; where a thousand sail may at once find commodious mooring.

BRATTON-CASTLE, on the E. side of Wexbury, in Wilts, the remains of a strong fortification, where the Danes held out against the English twenty-four days. It is seated on a hill, and is encompassed by two ditches, within which several pieces of old iron arms have been dug up.

BRAUBACH, a town of Germany, in Weteravia, with a castle, seated on the Rhine, eight miles S. of Coblenz.

BRAUN (George), in Latin *Braunius*, archdeacon of Dortmund, and dean of Notre Dame in Gradibus, at Cologne. He published a Latin oration against the priests guilty of fornication; he also wrote the *Life of Jesus Christ*, that of the Holy Virgin, and a controversial treatise against the Protestants; but his chief work is the *Theatrum Urbium*, in several volumes folio.

BRAY, a village of Berkshire, famous in song for its vicar, who, having been twice a Papist, and twice a Protestant, in the reigns of Henry VIII., Edward VI., Mary, and Elizabeth, and therefore taxed with being a turncoat, said, he always kept to his principle, which was, to live and die vicar of Bray. It is seated on the Thames, one mile from Maidenhead.

BRAZIL, erroneously spelt BZAZIL in our original article. See BRASILE.

BREAD (*Encycl.*) The following we add to our original article; viz. a method of fermenting a large body of flour with a small quantity of yeast, invented by Mr. James Stone, of Amport, in Hampshire. Suppose you want to bake a bushel of bread, and have not more than one tea-spoonful of yeast; put the flour into a kneading-trough, and take about three quarters of a pint of warm water, and the tea-spoonful of yeast, which if thick and steady the better; put it into the water, and stir it until it is thoroughly mixed; then make a hole in the middle of the flour large enough to contain two gallons of water; pour in your small quantity of yeast, mixed with water as above; then take a stick about two feet long, and stir in some of the flour until it is as thick as you would make batter for a pudding; strew some of the dry flour over it, and let it rest for about an hour, for in that time you will find this small quantity raised so that it will break through the dry flour which you shook over it; then pour in about a quart more of warm water, and stir it with your stick as before, and leave it for two hours more; you will find it rise, or break through the dry flour again; then add three quarts or a gallon more of warm water, and stir in the flour again; and in about three or four hours mix up the dough, and cover it warm. In four or five hours more you may put it in the oven, and you will have as light bread as though you had used a pint of yeast. It does not take above a quarter of an hour more time than the usual way of baking; for there is no time lost but that of adding water three or four times. When you find your body of flour sponged large enough, before you put in the rest of the water you should, with both hands, mix that which it sponged and the dry flour altogether, and then add the remainder of warm water, and your dough will rise the better and easier. The author asserts, that he constantly bakes this way: in the morning, about six or seven o'clock, he begins his first operation; in an hour's time he adds more water, in two hours more a greater quantity, about noon he makes up the dough, and about six in the evening it is put into the oven; and that he has always good bread, never heavy nor bitter. He adds, that the cause of heavy bread is not owing to the smallness of the quantity of yeast used, but to its not being used properly, for yeast is to flour what fire is to fuel—a spark of the latter will kindle a large body by only blowing it up, so a thimble full of the former, by adding warm water to it, will raise or sponge almost any quantity of flour.

This heavy bread is not owing to a deficiency in the quantity of yeast used, but to a deficiency of fermentation; for, if the dough be put into the oven before it is ripe, heavy bread is the natural consequence. In regard to the difference of seasons, he prescribes that in summer the water should be blood-warm, and in cold frosty weather as warm as you can bear your hand in it without making it smart; taking care in winter to cover up your dough.

In the British Magazine for 1800, we are taught how to make bread without yeast, as practised in Hungary.

Boil two good handfuls of hops in four quarts of water; pour this upon as much wheat bran as the liquor will moisten. To this add four or five pounds of leaven: mix the whole together, so as to unite the parts. Put this mass into a warm place for twenty-four hours; then divide it into pieces about the size of an hen's egg, which should be dried in the air, but not in the sun, and then will keep six months.

For six large loaves, six good handfuls of this broken small, and dissolved in eight quarts of warm water, and poured through a sieve into one end of the bread-trough; and three quarts more of warm water are poured through the

sieve after it, and what remains in the sieve well pressed out. This liquor must be mixed up with as much flour as will make a large loaf. This to be strewed over with flour, the sieve with its contents put upon it, and the whole covered up warm. When its surface begins to crack, fifteen quarts of warm water, in which six handfuls have been dissolved, must be poured through the sieve upon it, and the necessary quantity of flour added, and mixed and kneaded with the leaven; this must be covered up warm and left about an hour, then made up into loaves, which are kept in a warm room half an hour, and after that put into the oven till sufficiently baked.

"The leaven," says Mr. Holt, of Walton near Liverpool, who relates this process, "may be made in large quantities. By large loaves, I find by enquiry, in our own practice, is meant twelve pounds of flour, and to which four ounces of leaven in a dried state is a proper quantity."

The following account of *substitutes for flour or bread* we extract from an excellent contemporary work, entitled *The Domestic Encyclopædia*.

We have, in the preceding analysis, as well as on former occasions, mentioned various substances which might advantageously be employed in the manufacture of this indispensable article of human sustenance; independently of the different kinds of grain and roots that are already made subservient to this beneficial purpose. In order to exhibit a distinct view of the most promising substitutes, whether indigenous or exotic, and especially such as have actually been used, on the authority of credible evidence, we shall here divide them into three classes, having, in the course of the work, given a more particular account of each article, in its alphabetical order.

I. *Farinaceous Seeds*:—Wheat-grafs, or *Triticum Spelta*; millet, or *panicum milaceum*; common buck-wheat, or *polygonum fagopyrum*; Siberian buck-wheat, or *polygonum tataricum*; wild buck-wheat, or *polygonum convolvulus*; wild Fescue-grafs, or *Festuca fluitans*; Maize, or Indian Corn, the *Mays Zea*; Rice, or *Oryzafativa*; Guinea Corn, or White Round-seeded Indian Millet; the *Holcus Sorghum*, L.; Canary-grafs, or *Phalaris Canariensis*; Rough Dog's-tail Grafs, or *Cynofurus echinatus*; Water Zizany, or *Zizania aquatica*; Upright Sea Lime-grafs, or *Elymus arenarius*; Sea-reed, Marram, Helme, or Sea Mat-weed, the *Calamagrostis*, or *Arundo arenaria*.

The following mealy fruits, however, deserve a decided preference over many of the preceding: viz. Water Caltrop, or the fruit of the *Trapa natans*, L.; Pulse of various kinds, such as Peas, Lentils, Beans, and the seeds of the Common Vetch, Fetch, or Tare-acorns, and especially those of the *Quercus cerris* and *scutulus*; the seeds of the White Goose-foot, Common Wild Orange, or the *Chenopodium album*; the seeds and flowers of the Rocket, or *Brassica eruca*; the seeds of the Sorrel, or *Rumex acetosa*; of the different species of Dock, or *Lapathum*; of the Yellow and White Water-lily; or the *Nymphaea lutea* and *alba*; of the Corn-spurrey, or *Spergula arvensis*; of the Spinnage, or *Spinachia oleracea*, L.; of the Common Gromwell, or Graymill, the *Lithospermum officinale*; of the Knot-grafs, or *Panicum ariculare*; the Beech-nut; and even the husks of the Linseed, &c.

II. *Farinaceous Roots*: namely, those of the Common and Yellow Bethlehem Star, or *Ornithogalum luteum* and *undellatum*; of the well-known Yellow Asphodel; of the Wake Robin, or *Arum maculatum* (after being properly dried and washed); of the Pilewort, or Lesser Celandine, the *Ranunculus ficaria*; of the Common Dropwort, the *Spiraea filipendula*; of the Meadow-sweet, or *Spiraea ulmaria*;

of the White Bryony, or *Bryonia alba*; of the Turnip rooted Cabbage, or *Napobrassica*; of the Great Bistort, or Snake-weed; likewise of the Small, Welch, or Alpine Bistort; of the Common Orrobis, or Heath-pea; the Tuberous Vetch; the Common Reed; both the Sweet-smelling and Common Solomon's Seal; the Common Corn-flag, or *Gladiolus communis*; the Salt-marsh, Club-rush, or *Scirpus maritimus*, &c.—Indeed, some authors also include in this list the roots of the *Mandragora*, *Colchicum*, *Fumaria bulb*, *Helleborus acconitifol*, and *nigr*. *Lilium bulbif*, and many others; but for these last mentioned we have not sufficient authority.

III. *Fibrous and less juicy Roots*: viz. those of the Couch-grafs, or Creeping Wheat-grafs; the Clown's, or Marsh Wound-wort; the Marsh Mary-gold, or Meadow Bouts; the Silver-weed, or Wild Tansey; the Sea Seg, or *Carex arenarius*, &c.

Having thus stated the various substitutes for bread, which either have already been adopted with success in this country, or which might, in times of real scarcity, be easily converted into proper nutriment, we cannot better conclude this article than in the words of Arthur Young, esq. who, in his Observations on the late Royal Proclamation, recommending frugality in the consumption of corn, as one of the surest and most effectual means of alleviating the present pressure of the times, expresses the cause of the unfortunate poor, nearly in the following words: Every master or head of a family is in duty bound to second, without compulsion, the humane views of the legislature. Hence, bread made of the whole produce of the wheat, excepting only seven pounds of the bran in each bushel, and adding one-fourth or third part of a substitute, would probably be the most effective saving. If the consumption of the whole kingdom be computed at 8,000,000 of quarters in twelve months, this saving on all the wheat consumed in nine months would be 700,000 quarters, which would feed 875,000 persons, at the ordinary consumption of one quarter a head per annum; and probably be equal, under the present restrictions, to afford food to 1,000,000 of people for the next nine months. Further, if the saving of oats to the supposed number of 500,000 horses of luxury, be calculated at one bushel per week, this would, in nine months, amount to 18,000,000 of bushels; or sufficient to support 1,000,000 of persons for the same period of time, allowing to each not less than twenty-five bushels per annum. With due deference to Mr. Young's statistical information, however, we beg leave to doubt whether 500,000 fat horses, crammed on the food of man, move about the kingdom; though it must be acknowledged, that *pleasure horses* are spectacles of envy to the starving poor—abominable and scandalous spectacles, which, in times like these, ought to be removed from the view of those whose miserable children might be fed on the corn thus saved."

BREMENWOERD, a town of Germany, in the duchy of Bremen; formerly a fortified town; but, since the year 1683, the fortifications have been demolished. It is 27 miles N. of Bremen. Long. S. 45. E. Lat. 53. 33. N.

BRENT, a river of Somersetshire which rises in Selwood Forest, on the edge of Wilts, and receiving several rivulets, particularly one from Shepton-Mallet and Wells, falls into Bridgewater Bay.

BRENTE, a river which has its source in the bishopric of Trent, and falls into the gulph opposite Venice.

BRESLE, a river of France that has its source above Amale; separates the late provinces of Normandy and Picardy, waters Eu, and then falls into the English Channel.

BRESSUIRE, a town of France, in the department of

the two Sevrès and late province of Poitou, with a college, 35 miles N.W. of Poitiers.

BRETAGNE, a late province of France, 150 miles in length, and 112 in breadth. It is a peninsula, united on the E. to Anjou, Maine, Normandy, and Poitou. The air is temperate, and it has large forests. It is formed into five of the new departments of France; namely, the North Coast, Finistère, Ille and Vilaine, Lower Loire, and Morbihan.

BRETEUIL, a town of France, in the department of Lower Seine and late province of Normandy, seated on the river Iton, 15 miles S.W. of Evreux. Long. 1. o. E. Lat. 48. 56. N.

BREWING (*Encycl.*). In March, 1783, Mr. W. Ker, of Kerfield, Tweeddale, received the king's patent for his improvement in brewing ale, beer, porter, and other malt liquors, so as to have a considerable portion of hops, to produce the liquors of a superior flavour and quality, and render them less liable to become acid or putrid. The steam which arises from the boiling copper, is known to be strongly impregnated with the essential oil of the hops, in which their flavour consists. Instead, therefore, of allowing it to escape and evaporate, as it does in the common mode of brewing, Mr. Ker contrives to preserve and condense it, by means of a winding-pipe fixed to the copper, similar to the worm of a still, or by a straight pipe passing through cold water, or any other cooling medium. The oil and water, thus obtained, are returned into the worts, when boiled; or the oil, after being separated from the water, along with which it had been exhaled, is returned into the worts after they are boiled; and the watery part, which, after the oil is separated, still continues impregnated with the aromatic taste and bitter of the hop, is returned into the next copper or boiling vessel, and so on, from one copper or boiling vessel into another. By this process, a considerable part of the hop and flavour, which is lost in the ordinary mode of brewing, is preserved; the flavour of the liquor is improved by the preservation of the finer parts of the aromatic oil; and the ale and beer are better secured from any tendency to acidity or putrefaction, and therefore must be fitter for home consumption and exportation.

In June 1790, Mr. John Long, of Ireland, obtained a patent for an improvement, which he calls *an entire new method, in all the essential parts of brewing good malt liquor*. Though his method, in one respect, is similar to that adopted by Mr. Ker, yet, as it comprehends the whole process of brewing, we shall lay it before our readers, nearly in the words of its author.

1. For the better extracting the virtues of malt, place near a mash-tun a shallow copper, or other vessel, that will readily heat, the curb of which to be on a level with the run, and to contain from two to six hogheads, according to the dimensions of the tun, more or less; and, at the lower end of the copper, have a cock, from two to five inches in diameter, to conduct the heated liquor from the copper into a tube, which passes down the external part of the tun, and enters it through an aperture about six inches from the bottom; then forming two revolutions, more or less, through the body of the tun, and communicating its heat to the wort as it passes through the tube; and then, at a convenient distance from the place where it first entered, it runs from the tun into a cistern or tub, situate as near as convenient to the copper or heating-vessel. In the tub or cistern is to be placed a pump, for the purpose of conveying the cooler liquor back to the copper or heating-vessel again, there to receive the heat of 208 degrees, more or less (which it will require after the first half hour), and then convey it through

the mashing-tun, as before, and in the same manner, as long as the working-brewer may think necessary, to raise the mashing-tun to any degree of heat required. By adhering to the foregoing process, the first liquor may, with the greatest safety, be let upon the malt, from 20 to 30 degrees lower than the present practice; by which means it operates with gentleness, opens and expands the malt, and prepares it for the reception of sharper or warmer liquor, so as to extract the whole of the saccharine quality from the malt. By the foregoing method, the mashing-tun, instead of losing its first heat (which it does by the present practice), continues to increase in heat every moment, by conveying the heated liquor through the tube into the tun; by which means, at the end of two hours, the working-brewer can have the tun brought to any degree of heat he shall think best suited to the different qualities of the malt. Persons who would wish to save expence, may heat their mashing-tun at the side or bottom, by a large piece of metallic substance made fire-proof, and fixed therein; which, in some degree, will answer the end proposed, but with great trouble and delay.

2. To prevent the wort from receiving a disagreeable flavour, while in the under-back, a tube must be placed at the cock of the mashing-tun, to receive the wort as it comes off, and convey it to a great cistern, or refrigerator, which is supplied with a stream of water. The wort, passing through that medium in a spiral tube, soon loses that heat which so often proves prejudicial to the brewer in warm weather: it is then poured from the tube into a vessel in which pumps are placed, to return the wort into the copper, for the purpose of boiling off.

3. As the great object of long boiling the wort is remedied, by this invention of taking the extract from the hops in a separate manner from the worts, Mr. Long boils the latter no longer than from fifteen to twenty minutes; and by pursuing that method, he saves much time and fuel, and regulates the length of time accordingly.

4. He steep his hops the preceding day to which they are to be used, in a copper or other vessel, with as much fluid, blood warm, as will cover the hops; where it is to remain over a slow fire at least fourteen hours, close covered; the copper, at the tenth hour, not to be of a greater heat than 175 degrees, continuing slow until the last hour. Then he brings the copper gradually to a simmer, or slow boil; in which state he suffers it to remain about ten minutes, and then runs off the fluid; and this he does at the same time the first wort is boiled off, that they may both pass together through the refrigerator, into the fermentation or working-tun. After the foregoing operation, he covers the hops again with other liquor, brings the copper to boil as soon as convenient, and lets it remain in that state a considerable time, until the second worts are boiled off. Then he passes the hop-fluid with the wort, the same as in the first instance; and, if there is a third wort, he boils the hops a third time with small worts, and drains off the liquid as before; by which means he gradually obtains the whole of the essential oil and pleasant bitter from the hops, which is effectually preserved in the beer.

5. When the wort is boiled off, it is conducted from the cock of the copper or boiler into a tube of a proper dimension, which passes the wort from the cock to the large cistern or refrigerator, and there performs several revolutions, in a spiral manner, through the same tube; which is immersed in a constant supply of cold water, where it loses the greatest part of its heat in a short time, and thence continues a straight course through the tube, a little elevated, and some suitable length, placed in brick-work, until it meets a small

refrigeratory, supplied with colder water from a reservoir made for that purpose, at the head of the works; whence a continual stream runs on the surface of the tube down to the great refrigeratory, cooling the wort as it passes, in order to enable the working-brewer to send it into the backs, or working-tuns, at whatever degree of heat he may think proper. The tube may be made of lead, or any other metallic substance.

6. To enable him to brew in the warm summer months, Mr. Long sinks the backs, or working-tuns, at least to a level with the ground, but if deeper the better, and covers them closely by an arch made of bricks, or other materials, that will totally exclude the atmospheric air. He then places them as near as possible to a spring or sand-drain, as their depth will naturally draw the water thence, which must be so contrived as to pass or flow round the backs or tuns. Next, he introduces a large tube, which passes through the tuns, and keeps the wort several degrees lower than can possibly be done by the present practice; by which means he produces a complete fermentation, even in the dog-days.

7. In cold or frosty weather, if the tun and backs should lose the first heat, intended to be conducted through the process by the foregoing method, a supply of warm or boiling water may be conveyed by the tube, which passes through the body of the backs or tun, communicating its heat, which rises to any degree the working-brewer shall think proper: by pursuing this method, in the coldest season, a fermentation may always be procured.

In February 1798, Dr. Richard Shannon obtained a patent for his method of improving the processes of brewing, distilling, boiling, evaporating, raising, applying, and condensing steam or vapour from aqueous, spirituous, saccharine, saline, and other fluids. The principle of his invention consists chiefly in the following arrangement: By covering and making the mash-tun air-tight, and casing it round, under and over, with a steam-tight casing, so that, during the mashing and soaking of the malt and grain used, the heat may be preserved, or raised and regulated to any pitch, by the application of steam, both in and between the casing of the mash-tun; by which contrivance, the whole of the *farina* and substance of the grain may be as effectually extracted in one, or at most in two mashings, as is now done in three or four. The steam, conducted by a proper tube or pipe, is to be also employed for sweetening and cleansing all the brewing, distilling, and vinegar-making utensils, and casks employed in each, &c. so as in future to prevent furring, foxing, &c. even in the inmost crevices.

In June 1798, the same patentee, in partnership with Mr. Robert Burnett, of Vauxhall, procured another patent, for the discovery of a principle and invention of a method of improving the process of fermentation, by which porter, beer, ale, malt and molasses wash, wine, cyder, and all other saccharine and fermentable fluids, may be conducted with certainty through the vinous process of fermentation in mild, warm, hot, and cold weather, without being materially injured as heretofore, by the different changes of the atmosphere, &c. But as these improvements depend on the application of an expensive *pneumatic apparatus*, which does not appear to us adapted to the use of families, we refer the reader to the tenth and fourteenth volumes of the *Repository of Arts and Manufactures*, where he will find a detailed specification of both patents.

The last patent we shall mention, is that of Mr. Thornton, of East Smithfield; which, being dated April 15, 1778, is earlier than either of the preceding, and does not strictly relate to the process of brewing, as his invention consists in a new method of *reducing malt and hops* to an essence or ex-

tract, from which beer may be made either at sea or in distant countries. The whole is managed by the transmitted heat of compressed vapour of boiling water, and a proper apparatus for that purpose. This apparatus may be made of iron, tin, or copper: it consists of a boiler of any dimensions, a double vessel, and conducting tubes. The double vessel consists of one vessel placed within another, and fitted tight at their rims. The upper vessel forms the upper part of the under vessel, and contains the liquor to be evaporated. The under vessel is every-where inclosed, except at an aperture communicating with the boiler, and at another aperture communicating with the conducting tubes; and is constructed so as not to allow any part of the vapour condensed into drops within it to escape, except back again into the boiler: it is not so extensive as to act as a common refrigeratory, and yet is capacious enough to prevent the liquor boiling over. The aperture communicating with the boiler is large enough to freely admit the vapour from the boiler into the under vessel; and the aperture communicating with the conducting tubes is of a proper size to allow of the vapour in the under vessel being compressed, to a degree capable of transmitting to the liquor to be evaporated a proper heat, and at the same time to serve as a passage for more heat than is necessary to keep up that degree of compression. The conducting tubes are to convey this superfluous heat or vapour, to be used for farther purposes, or immediately out of the building.

Those of our readers who are desirous of further information on the subject, may consult the last edition of *Philosophical Principles of Brewing*, by Mr. Richardson, of Hull; a work of acknowledged merit, and practical utility.

BRICKS (*Encecl.*). In addition to what has been said under that article, it is necessary briefly to notice the patent of Mr. Sandford, of Hartford, in Connecticut, North America. On the 20th of January, 1800, he received the king's patent for a method communicated to him by Dr. A. Kinley, of the same place, for manufacturing bricks, tiles, and pottery-ware in general, and for discharging the moulds used therein. The principle of this invention is amply detailed in the specification, a copy of which is inserted in the 13th volume of the *Repository of Arts*, &c. p. 148, and following, illustrated by a plate. From the subjoined extract, however, the reader may form a tolerable idea of the nature and utility of this invention, which chiefly consists in a newly-contrived apparatus, for expediting the tedious process of making bricks, and other earthen-ware. The moulds used in this machine may be various, either with false or fixed bottoms, sides, or ends; or open at top, bottom, sides, or ends: but such as are used by the original inventor, Dr. Apollon Kinley, are the most convenient, and contain from one to six bricks in each mould, according to their size. Each frame, or mould, has a fixed bottom; and when more than one brick is moulded in the same frame, or mould, the division between them is made in three parts. The middle piece is made a little tapering, and serves as a wedge to confine the other two parts in their places, while the mould is filling; and, when discharged, the wedge or middle part is lifted out, which liberates the other two: by that means the moulds are discharged with ease. Moulds for large single bricks and ornaments, have one side, bottom, or end, taken off by means of steady pins, joints, or cramps, which will confine them while filling, and may be opened in any way that will allow them to discharge. The moulds may be made of metal, or of wood and lined with metal. The foot of the spindle may stand in, and be supported by a bar, made fast to the platform, at the bottom of the tub; or it may be supported by a collar, inclosing the spindle above the semi-circular sections, and made fast to the tub; by that mean the whole space under the forcers will be open, and free to form

bricks and ornaments of any size or shape. The friction-rollers are placed in a frame which may be raised or lowered by screws, according to the thickness of the bricks or ornaments: and, by means of the screws, the moulds may be liberated from any foul matter that may obstruct their passage through the machine. Clay for bricks, ornaments, potters-ware, and tiles, of all descriptions, may be tempered and moulded, of any size or shape, in the above-described apparatus. The clay being put into the tub is, by the action of the sections, perfectly tempered and moulded at the same time, &c.

The reasons why the modern bricks are so very inferior to those made by the ancients; which, in their monuments, after having withstood the ravages of time for many centuries, are still in perfect preservation, appear to be principally the following: in the present expensive state of society, the price of manual labour, though far from being adequate to the pressure of the times, is so considerable, that the manufacturer is under a kind of necessity to make choice of those materials which are the cheapest and most easily procured: thus, a mixture of the most improper earths and clay is often employed in the manufacture of bricks, without reflecting that two bodies specifically different in their nature, must necessarily require different degrees of heat in the kiln, in order to produce an uniform hardness, and an intimate combination of parts. On the contrary, the ancients not only selected the very best sort of clay, but combined it with other ingredients well adapted to form the most complete cement, such as coarsely powdered charcoal and old mortar added to the clay. Of this description, likewise, were the bricks which Professor Pallas, on his last journey through the southern provinces of Russia, discovered in the stupendous Tartar monuments, and which would scarcely yield to the force of a hammer. Another advantage peculiar to the bricks and tiles manufactured by our forefathers, arose from their method of burning them uniformly, after being thoroughly dried. There is no doubt, that if all the defects before pointed out were removed, and modern brick-makers were to pay more attention to their art, by digging the clay at proper seasons, working it better than is done at present, bestowing more care on the burning of them, and particularly by making them much thinner than what is prescribed by the standard form, we might produce bricks of an equal strength and durability to those of our less enlightened, but more provident and industrious, ancestors.

BRIDGE (*Encycl.*). A patent was granted to Mr. Nath. of Dover-street, in 1797, for an invention somewhat similar to that across the Wear. He provides hollow masses of cast or wrought iron, which are to be filled with earth, sand, &c. and have the appearance of solid bodies. According to this plan, the arch of the bridge is formed by hollow frames, or boxes, each consisting of four sides and a bottom. These boxes, after being properly arranged in the manner fitted by the patentee, are then to be filled with sand, stones, &c. by which means the arch becomes like one solid body cased with iron. A further explanation of this invention may be seen in the 6th volume of the *Repertory of Arts and Manufactures*.

The latest patent for bridges, was that granted in June 1800, to Mr. Samuel Wyatt, of Chelsea College, for his invention of a new method of constructing bridges, warehouses, &c. without the use of wood, as a constituent part. The principle of his discovery consists in the combination of pipes, tubes, or hollow pieces of cast-iron, in a longitudinal direction, and plates or pieces of the same material, having sockets in them to receive the ends or shoulders of the pipes, placed transversely, and extending from one side of the bridge to the other, so that when the requisite number of pipes, &c. are put together, they form the arch so firmly as not to re-

quire the aid of screws, bolts, cramps, or any iron fastening whatever; but the joints should be closed with lead or cement.

When applied to warehouses and other buildings, Mr. Wyatt's invention consists in forming arched ceilings of cast-iron, and supporting them and the floors by hollow pillars, or cylinders, of the same material. It ought to be remarked, that the number of sockets in the transverse iron plates, should always correspond with the number of ribs in the arch.

BRIDGE-END, a town of Glamorganshire, with a market on Saturday. It is seated on the river Ogmere, which divides it into two parts, joined by a stone bridge. It is seven miles W. by N. of Cowbridge, and 178 W. of London. Long. 3.38 W. Lat. 51.30. N.

BRIENTZ, a lake of the canton of Bern, in Switzerland, three leagues long and one broad. It is well stored with fish; with a very delicate kind especially, which is peculiar to this lake, and which is salted and dried like red-herrings. The river Aar runs through the whole extent of this lake, and unites it to that of Thun. Beside the Aar, the lake of Brientz receives the Lutschinen. See *LUTSCHINEN*.

BRIEY, a town of France, in the department of Moselle and late province of Lorraine, seated near the river Manie, 30 miles N.E. of St. Michael.

BRIGANTIA, or **BRIGANTIUM** (anc. geog.), a town of Vindelicis; now *Bregentz*, in Tyrol, at the east end of the lake of Constance. Another *Brigantium* in the Alpes Cottiae; which last is probably Briançon, a town on the borders of Dauphiny.

BRIGANTINUS LACUS (anc. geog.), a lake of Rhatia, or Vindelicis, which Tacitus includes in Rætia. Ammian calls the lake *Brigantia*. It took its name either from the Brigantii, the people inhabiting on it, or from the adjoining town. Now the lake of *Constance*, or *Bodensee*.

BRIGANTINUS PORTUS (anc. geog.), a port of the hither Spain; so called from Flavius Brigantium. Now *El Puerto de la Coruña*, commonly the *Groynne*.

BRIGGS (William), an eminent physician in the latter end of the 17th century, was the son of Augustin Briggs, esq. four times member for the city of Norwich, where our author was born. He studied at the university of Cambridge; and his genius leading him to the study of physic, he travelled into France, where he attended the lectures of the famous anatomist M. Vieuissens, at Montpellier. After his return, he published his *Ophthalmographia* in 1676. The year following he was created doctor of medicine at Cambridge, and soon after was made fellow of the College of Physicians at London. In 1682 he quitted his fellowship to his brother; and the same year, his *Theory of Vision* was published by Hooke. The ensuing year he sent to the Royal Society a continuation of that discourse, which was published in their Transactions; and the same year he was, by King Charles II., appointed physician to St. Thomas's hospital. In 1684 he communicated to the Royal Society two remarkable cases relating to vision, which were likewise printed in their Transactions; and in 1685 he published a Latin version of his *Theory of Vision*, at the desire of Mr. Newton, afterwards Sir Isaac, professor of mathematics at Cambridge, with a recommendatory epistle from him prefixed to it. He was afterwards made physician in ordinary to King William, and continued in great esteem for his skill in his profession till he died, September 4th, 1704.

BRIMPSFIELD, a village of Gloucestershire, on the river Stroud. Here are the foundations of a castle long destroyed. It had also a nunnery. The river Stour rises here, and the turnpike road from Gloucester to Cirencester (the Ermine-street of the Romans) extends along the side of this parish, and divides it from Cowley. It is seven miles from Gloucester.

BRINN, a strong town of Moravia, where the assembly of the states meet. It was invested by the Prussians in 1742; but they were obliged to raise the siege. It is seated at the confluence of the Zwittia and Swart, 53 miles N. of Vienna, and 27 S.W. of Olmütz. The castle of Spielberg is its principal defence, and is seated on an eminence. Long. 16. 49. E. Lat. 49. 6. N.

BRISSAC, a town of France, in the department of Maine and Loire and late province of Anjou, seated on the river Angre, 13 miles S. of Angers. Long. 6. 27. W. Lat. 47. 20. N.

BRISTOL (*Encycl.*). The "crops" described in that article as "standing in the College Green," should not have been mentioned. It was removed several years ago, and is now in the garden of Sir Richard Hoare, at Sturton.

BRITAIN, New, an island to the north of New Guinea. By whom this land was first discovered is uncertain. Dampier first failed through the strait which separates it from New Guinea; and Captain Carteret, in 1767, failed through another strait which divides it into two islands, the northernmost of which he called *New Ireland*. New Britain lies in long. 152. 49. E. and lat. 4. 0. S. The shores of both islands are rocky, the inland parts high and mountainous, but covered with trees of various kinds, among which are the nutmeg, the cocoa-nut, and different kinds of palm. The inhabitants are black, and woolly-headed, like negroes, but have not their flat noses and thick lips.

BRITANNICA, in botany, the trivial name of the *rumex* aquatics. See *RUMEX*.

BRITANNICUS, son to the Emperor Claudius by Messalina, was excluded from the empire after his father had married Agrippina; who put her son Nero on the throne, and caused Britannicus to be poisoned, A.D. 55.

BRITANNICUS, an Italian, one of the best humanists of the 15th century, was born at Brescia. He published notes on Perſius, Juvenal, Terence, Statius, and Ovid. He died in 1510.

BRIVA ISARÆ (anc. geog.), a town of Gallia Belgica on the river Hara or Oyse: now *Poyntouffe*.

BRIVATES (anc. geog.), a part of Gallia Celtica: now *Bress*, in Britany.

BRIXIA (anc. geog.), a town of the Cenomani in the Regio Transpadana: now *Brescia*, capital of the Bresciano.

BRIZEN, or **BRIZZEN**, a town of Germany, in the Middle Marche of Brandenburg, seated on the river Adah, 12 miles N.E. of Wirtemberg.

BROAD-TENNESSE, a noble river of N. America, which rises in N. Carolina, and crosses the parallel of 35°. N. lat. into the state of Georgia; just before it passes through Cumberland or Laurel Mountains. Its passage through these mountains occasions a remarkable whirl. The stream, which a few miles above is half a mile wide, is here compressed to the width of about 100 yards. Just as it enters the mountain, a large rock projects from the northern shore, in an oblique direction, which renders the bed of the river still narrower, and causes a sudden bend: the water of the river is thrown, consequently, with great rapidity, against the southern shore, whence it rebounds around the point of the rock, and produces the whirl, which is about 80 yards in circumference. Canoes have been often carried into this whirl, and escaped unhurt. Near a mile below, the river spreads into its common width, and, except the interruption of some muske shoals, flows in a beautiful and placid stream, till it mingles with the Ohio; before it reaches which, it is called the *Cherokee river*.

BROD-NEMEKEI, or **TREUTCH-BROD**, a town of Bohemia, on the river Sozawa, 20 miles S. by E. of Czaſlaw. Long. 15. 40. E. Lat. 49. 33. N.

BRODZIEC, a town of Lithuania, on the river Berezina, 100 miles S. of Poloczki. Long. 28. 5. E. Lat. 54. 8. N.

BROEK, a town of Germany, in the circle of Westphalia, and duchy of Berg; the capital of a county of the same name, seated on the river Roer, 11 miles N. of Duffeldorp. Long. 6. 53. E. Lat. 51. 23. N.

BROEK, in North Holland, six miles from Amsterdam, one of the most singular and picturesque villages in the world. "The inhabitants," says Madame de Sillery (late Countess de Genlis), "though peasants only, are all rich. The streets are paved in mosaic work, with variegated bricks, and display the greatest neatness. The houses are painted on the outside, and are as fresh and bright as if quite new. Each has a garden and terrace, inclosed by a low railing, that permits every thing to be seen. The terrace is in the front of the house, and from this we descend into the garden, which forms the separation between each house. The streets on both sides are laid out in the same manner. The gardens are adorned with china vases, grottoes of shell-work, trees, and flowers; with borders composed of minute particles of glass of different colours, of a dazzling brightness, and disposed into a variety of forms. There are likewise other borders formed of small shells, and arranged with as much skill and care as those in a museum. Behind the houses and gardens are extensive meadows, full of cattle grazing. The outhouses are likewise behind; so that waggons, carts, and cattle, never enter these neat streets. The floor of the houses are paved with shining stones, in equal squares, commonly black and yellow. The principal apartments are waincotted. This waincot is of its natural colour, ornamented with the prettiest sculpture imaginable. In the best room is a large buffet, with glass folding-doors, through which are seen the most beautiful china, and quantities of plate perfectly bright. One would imagine, from their uniformity, that the fortunes of the respective owners were equal. In every house are two doors, one of which is called *the door of ceremony*, being never opened but for the event of marriage or death. The new-married couples enter at this door, and never pass through it again but to their graves: in the interval it is constantly shut up. They have also a chamber, which is never made use of but on their wedding-day; and it is ever after considered as a temple, in which it would be a profanation to sleep. This chamber is more splendid than the others, and the bed is profusely ornamented with lace. On a table is a pretty basket, which contains the finery worn by the bride on her wedding-day. In a word, they never enter this sacred retreat but to adorn it with vases of flowers, or to shew it to strangers. The dress of the men is very plain, and that of the women as studied. They wear the most beautiful silks, the finest linen, and many trinkets of gold and pearls. A hood of white cambric conceals their hair, fastened on the two sides by large gold pins set with fine pearls. Many servants are dressed in this manner: their mistresses excel them only in finer necklaces, rings, and more expensive linen. The manners of these people are irreproachable: they live together in perfect harmony; but are very uncivil to strangers. The moment they see such arrive, they shut themselves up, and refuse to open their doors; but they have a natural gallantry, or, to speak more properly, a certain respect for women, that makes them behave very differently to them. They no sooner see them, than they hasten to shew them every mark of politeness; and although the fair strangers were accompanied by men, this would not prevent their conducting them to the houses, and shewing them every thing. Their wives never stir from Broek, and a young woman would find it difficult to marry, if she went to another village a small distance from it. Amsterdam is as little known to them as London or Constantinople. They

find their happiness at home; Broek is the whole world to them; and they preserve, in course, their manners and their virtue. They marry invariably among themselves. Many nobles of this country have been desirous of espousing young women of Broek, on account of their riches; but the overtures of none have proved successful. The inhabitants pride themselves in their simplicity, and in their states as peasants. They lead a frugal life. To adorn their houses is the greatest pleasure they know: to live in peace the only happiness they court. Handsome as the natives are throughout all Holland, they are particularly so at Broek. The children are all charming; the men robust; and the women tall, well-made, and generally pretty, with a surprising freshness of complexion. In a word, this village exhibits a very singular picture. Every thing in it delights the eye and heart: not one disagreeable object appears to spoil the piece. Not only not a single beggar is to be seen, but not a person, moreover, who is not perfectly at ease; not a cripple, not one infirm old person, nor a single decayed house. Health; all that affluence can with; the elegance of industry and neatness; simplicity, humanity, virtue, and happiness; these are the inestimable advantages, these the delightful objects that we find at Broek; and which, added to the striking singularity of their dress, their houses, and their manners, render it altogether a very extraordinary place."

BROKEN BAY, a bay of New South Wales, on the E. coast of New Holland. It is formed by the mouth of a great river called the Hawkebury. Long. 151. 27. E. Lat. 33. 34. S.

BROMPTON, a populous village, in the parish of Kenington, in Middlesex. Here is the public botanical garden and library of Mr. William Curtis, the author of *Flora Londinensis* and other botanical works.

BROMPTON, a village in Kent, delightfully situated on an easy ascent from Chatham, and containing the fine barracks for the accommodation of the military of that garrison.

BROOM-GALL (*Encycl.*), in natural history. This gall is of a very singular kind: it is round and prickly; the stalk of the broom always grows directly through it, as if thrust through its middle; and, when nicely examined, the whole gall appears to be formed of a congeries of leaves much larger than those of the broom naturally are, and twisted into a sort of horns or cornets, ending in a point: these leaves are all hollowed in the middle; and are so thick set and nicely fixed to one another, that they make up the substance of the gall, which is nevertheless a considerably hard one, and their points make the appearance of spines or prickles on the outside. Sometimes there is a sort of fleshy or pulpy substance within it, which supports the leaves; and the worms are sometimes found in this, sometimes in the hollows of the leaves, and sometimes between them: they are so numerous, that there are often some hundreds of them in one gall. The origin of this gall is not from the eggs of the parent animal lodged in the tree; but they are deposited on the surface of the branches, and the young worms, while very small, almost as soon as hatched from them, go in company to some bud on the side of the branch: they get into the folds of this bud, and wounding it in several parts, cause a wrong derivation of the juices into it; the consequence of which is, that instead of forming a branch shooting out from the other, it only yields a congeries of leaves which everywhere surround it. These galls are of various sizes, the largest seldom exceeding that of a nut; and there are often three or four of them seen on one branch, placed at an inch or a little more distance from one another.

Broom, Loch, a great lake and arm of the sea, in Ross-shire, on the W. coast of Scotland. It has long been noted

for herrings of peculiar excellence, and is esteemed one of the best fishing stations on the coast.

BRORA, a seaport of Scotland, on the E. coast of Sutherlandshire. Here is a coal mine, which was lately worked, and the coal was used in the manufacture of salt. But this coal cannot be exported, or carried to any distance, as it takes fire on being exposed to the air. The lime-stone quarry, above this place, is an interesting fund of speculation: the variety of shells contained in the heart of the stone is equally surprising and beautiful. Brora is forty miles N. by E. of Inverness.

BRORA, a river of Scotland, in Sutherlandshire, which issues from a beautiful lake of the same name. Above Brora, it forms several fine cascades; and below that village it falls into the British Ocean. Many precipices on the banks of this river are full of shells, as in the lime-stone quarry near it.

BROUCA, a town of Sicily, on the S. side of the gulf of Catania; fifteen miles S. of Catania. Long. 15. 30. E. Lat. 37. 25. N.

BROUCKE, a town of Switzerland, in Argow, of which it is the third free city. It is seated on the river Aar, over which is a handsome bridge. There is likewise a college, with a public library. It is twenty-two miles S.E. of Basil. Long. 8. 4. E. Lat. 47. 21. N.

BROWNE (William), an old English poet of considerable excellence. As the peculiar fate of unmerited oblivion which attended this great genius precludes any minute disquisition, for his entire history may be compressed in a very small space; and it will be scarcely credited that we can find no trace of an edition of his works (excepting one) since the usurpation of Cromwell, although he had been highly commended by the learned Selden, and was an adopted favourite of the proud, but judicious, Ben Jonson. Mr. Dermody relates the particulars of our poet's life and writings in the following terms:

"William Browne, says he, was born at Tavistock in Devonshire, in the year 1590; his father, according to Prince, in his *Worthies of Devon*, being probably of the knightly family of Browne, of Browne's-Ilath, in the parish of Langtree, near Great-Torrington. After he had passed through the grammar-school, we find him at Exeter College in the university of Oxford, about the beginning of the reign of King James the First, where he became celebrated for classical erudition, and for his knowledge in the belles-lettres nearly unequalled; from thence, however, before he had taken any academical degree, he removed to the Inner-Temple, London, where he more assiduously devoted himself to the muse. In the beginning of the year 1624, he returned again to the college, was appointed tutor to Robert Dormer, who was afterwards Earl of Carnarvon, and lost his life at Newbury fight, on the 20th of September, 1643. On the 25th of March, 1624, our author received permission to be actually created a master of arts, although the degree was not conferred upon him till the November following. In the public register of the university he is styled thus: *Vir omni humanâ literaturâ, et bonarum artium cognitione instructus*.

"After he had left college with his pupil, he was gladly received into the family of the munificent Earl of Pembroke, who entertained a great regard for him, and in that situation he made his fortune so well, that he had it in his power to purchase a comfortable independence. The precise period of his death cannot be ascertained, but according to Wood, author of the *Athenæ Oxonienses*, it may be ascribed with most certainty to the year 1645.

"His *Shepherd's Pipe* consists of seven eclogues, among

which is an admirable monody, entitled *Philarète*, written upon the death of his friend Mr. Thomas Manwood, which, whether equally excellent or not, was certainly the model from which Milton did not disdain to borrow the charming idea of Lycidas, one of the most beautiful pieces of pastoral poetry that, perhaps, ever appeared in any language. There is another production of Browne, *The Inner Temple Masque*, to which I imagine the world of taste may esteem themselves equally indebted for the birth of *Comus*. Even this very distinction ought to have placed Browne in a more favourable light, for, assuredly, the divine framer of *Paradise Lost* would not condescend to copy an indifferent original at any time.

"But as I mean to confine myself more particularly to the notice of this author's chief performance, *Britannia's Pastorals*, I shall waste no speculation upon such miscellaneous pieces as occur, but just take the liberty of recommending them, indiscriminately, to the attention of the reader, and pursue my main subject with less deviation from the regular rules of criticism. The design, then, of those pastorals is original and perfect in the highest degree; they profess no imitation of any ancient or foreign writer; and are meant solely as a compliment to our own country, which is set in happy competition with that famous haunt of demi-gods, Arcadia itself. The style is harmonious and flowing, diversified with a pleasing assemblage of new and captivating imagery; and even the measure is sometimes changed, not for the worse, as it administers a kind of metrical relaxation, that relieves the fancy by variety without violence.

"To exemplify this assertion, I must beg leave to transcribe a few passages, which, considering the time they were composed, will be found not destitute of elegant thought, and polished verification. The following address to a river deity contains both those requisites, in my humble opinion:

— May first

(Quoth Marine) swaines give lambs to thee;
And may thy flood have seignorie
Of all floods else; and to thy fame
Meete greater springs, yet keep thy name.
May never euet, nor the toade,
Within thy bankes make their abode!
Taking thy journey from the sea,
Maist thou ne'er happen in thy way
On niter or on brimstone myne,
To spoil thy taste! this spring of thine
Let it of nothing taste but earth,
And salt conceived, in their birth
Be ever fresh! let no man dare
To spoile thy fish, make locke or ware,
But on thy margent fill let dwell
Those flowres which have the sweetest smell:
And let the dust upon thy strand
Become like Tagus' golden sand,
Let as much good betide to thee,
As thou hast favour shew'd to me.

Booke I. Song 2.

Nor do I think this other short extract inferior to any of our old poets in point of conception:

Near to this wood there lay a pleasant meade,
Where fairies often did their measures treade,
Which in the meadow made such circles greene,
As if with girlands it had crown'd beene,
Or like the circle where the signs we tracke
And learned shepheards call't the zodiacke:

Vol. X.

Within one of these founts was to be seene
A billocke rise, where oft the faire queene
At twilight fate, and did command her elves,
To pinch those maides that had not swept their selves;
And further if by maidens over-light,
Within doores water were not brought at night:
Or, if they spread no table, let no bread,
They should have nips from toe unto the head:
And for the maid that had performed each thing,
She in the water-pale bade leave a ring.

Ibid.

"The fulblimity of this exclamation will be a sufficient excuse for its insertion.

What muse! what powre! or what thrice sacred herse,
That lives immortal in a wel tun'd verse,
Can lend me such a sight that I might see
A guilty conscience true anatomic;
That wel kept register wherein is writ
All his men doe, all goodnesse they omit?
His pallid feares, his sorrowes, his affrightings,
His late wifd had-I-wits, remorseful bringings:
His many tortures, his heart-renting paine:
How were his griefs compos'd in one chaine,
And he by it let downe into the seas,
Or, through the center, to the antipodes,
He might change climates, or be barr'd heav'n's face,
Yet finde no false, nor ever change his case.

Ibid.

The preceding extracts are intentionally quoted to convey some idea of the general tenor of the work, we shall next introduce a few unconnected sketches of more than ordinary beauty; and then presume on no further intrusion, but a cursory critique, written in the most concise manner. A musical concert of birds is thus most fancifully, though quaintly, depicted:

Two nights thus past: the lilly-handed morne
Saw Phœbus stealing dewe from Ceres' corne,
The mounting lark (daie's herald), got on wing,
Bidding each bird chuse out his bough and sing:
The lofty treble sung the little wren;
Robin the meane, that best of all loves men;
The nightingale the tenor, and the thrush
The counter-tenor sweetly in a bush:
And that the musicke might be full in parts,
Birds from the groves flew with right willing harts:
But (as it seem'd) they thought (as do the swaines,
Which tune their pipes on sack'd Hibernia's plaines)
There should some drooning parrot be, therefore willd
Some bird to flie into a neighbouring field,
In embasie unto the king of bees,
To aide his partners on the flowres and trees:
Who condescending gladly flew along
To beare the bafe to his wel tuned song.
The crowe was willing they should be beholding,
For his deepe voice, but being hoarse with foulding,
He thus lends aide, upon an oake doth clime,
And nodding with his heade, so keepeth time.

Booke I. Song 3.

"No mind, susceptible of the charms of natural description, but will coincide with my sentiments on the excellence of the subsequent two very opposite, but equally well-delineated, landscapes.

These pitchy curtains drew 'twixt earth and heaven,
And as night's chariot through the air was driven,

5 R

Clamour grew dumb, unheard was shepherde's song,
And silence girt the woods ; no warbling tongue
Talk'd to the echo ; satyres broke their dance,
And all the upper world lay in a trance.
Onely the curled streams lost chidings kept,
And little gales that from the greene leaf swept
Dry summer's dust, in fearfull whipp'ings stir'd,
As loath to waken any singing bird.

Booke II. Song 1.

The muse's friend (grey cyde Aurora) yet
Held all the meadows in a cooling sweat,
The milk-white gossamores not upwards frow'd,
Nor was the sharpe and useful steering goad
Laid on the strong-neckt ox ; no gentle bud
The sun had dryde ; the cattle chew'd the cud
Low level'd on the grasse ; no flies quicke Ring
Inforc'd the stone-horse in a furious ring
To teare the passive earth, nor lash his taile
About his buttocks broad ; the slimy snayle
Might on the waincot (by his many mazes
Winding meanders and selfe-knitting traces)
Be follow'd, where he stucke, his glit'ring slime
Nor yet wipt off. It was so early time
The carefull smith had in his footy forge
Kindled no coale ; nor did his hammers urge
His neighbour's patience : owles abroad did flye,
And day as then might plead his infancy.

Ibid. Song 2.

"These are only the *disiecta membra poetarum*;" for, indeed, to do any diffuse performance, proper justice, it should be never taken by piecemeal, or exposed to public inspection by lines and sentences; yet as there is no other method, at first, of rescuing its merit from immediate obscurity, even this mode of selecting a few specimens may be not unworthy of approbation. The good taste of the present day has been highly favourable to those pieces executed in the simple style of pastoral, as the liberal reception which *The Farmer's Boy* has deservedly received very amply testifies. It contains a profusion of exquisite images, enriched with the highest colouring, though perfectly chaste, and never distorted by a gaudy extravagance. I may be suspected by many of having a whimsical turn for hypothesis; but I declare I have fancied various instances of a corresponding genius between William Browne and Robert Bloomfield, not forgetting this one material difference and advantage, that the former was a profound and accomplished scholar. But what I remark as a coincidence in both promiscuously, is an unaffected felicity of calling forth new objects from the level scene of life; and an harmony of style and expression peculiarly fortunate. The poets of Elizabeth's reign down to that of James, piqued themselves on a pompous display of learned acquisition, nearly approaching to pedantry; it was an established custom to bring in the heathen mythology on every occasion; and even so late as Waller and Lonsdowne, we can trace the progress of this absurd fashion, which, in the infancy of English poetry, was more pardonable. Now, in our enlightened era, a person who should crowd his pages with a motley texture of Grecian demi-gods and heroes, would justly merit the derision of the judicious; and even the frequent invocation of the muse, a being whom we acknowledge merely ideal, having lost its primary attraction, though not yet entirely discarded, is unnatural and unhappy; unnatural, from the improbability it casts on any grave subject; and unhappy, from the obsolete insipidity of the fiction.

"Browne's pastorals are not very faulty in this respect;

the ancient fables which he does, at times, allude to, are not the most hackneyed, and his main story is, at any rate, as I mentioned before, entirely his own. His allegories are not so intricate as those of his contemporaries; they are picturesque without perplexity, and favour more of the school of Tasso than that of Spenser. Yet two of his imaginary personifications would not, perhaps, disgrace the sublime pencil which dashed out the wild horrors of the Cave of Despair; namely, Riot, in Book I. Song 4; and Limes, or Famine, in Book II. Song 1. We there defy all the bold and poetical conceit of Ovid, in the favourite parts of his *Metamorphoses*, without those minute and laborious touches which seldom come from the hand of a very great master. Salvator Rosa might have here satiated the luxury of his imagination, without restraining his enthusiasm. It is certain that our most inspired children of fancy did not dwell in patient apathy on the niceties of composition. What can be more fervid and engaging than the irregular graces of Collins, who was a profest admirer of our old bards, who made them his chief study, and even forfeited the estimation of all but the congenial few through a desire of indulging in these rapturous excursions! There are some, and those by far the most delicious of his odes, which to a common plodding reader would appear verging closely on the confines of absolute insanity; but I am mistaken much, if they appear so to the man whose "eye in a fine frenzy rolling, glances from heav'n to earth, from earth to heav'n!" I have likewise to assert, that one of the most exquisite little poems we can boast, entitled *A Hymn to May*, was written by William Thompson, whose fancy was fed with the pure honey of Browne, and who revised the only modern edition of his works. This hymn, so much deserving the notice of every elegant reader for the voluptuous tenderness of its language, although composed after the ancient model, is to be found in the *Poetical Calendar*, published periodically, some time ago, by Fawkes and Woty; wherein some other pieces of considerable value are included.

"I know of no two productions more worthy of revival by some man of influence and fortune, than this, which I have attempted to draw into a fainter degree of observation from its long unmerited darkness of recess; and *The Piscatory Eclogues* of Phineas Fletcher, whose *Purple Island*, though inferior, has been favourably regarded by some late commentators of literary eminence. I am conscious this slight effusion of applause, secretly nourished since my earliest days, is both desultory and incorrect; yet I wished to discover a mine to which I have been indebted for much intellectual treasure; and the rich ore extracted from which source, I have so publicly prefixed as the very motto to my first poetical exertion.

"I quit my talk thus, far from being finished, with particular regret, transferring it to the care and abilities of some abler hand, with another concluding quotation.—

Looke as a lover with a lingering kisse,
About to part with the best half that's his;
Faine would he stay but that he feares to do it,
And cursefeth time for so fast hastning to it;
Now takes his leave, and yet begins anew
To make lesse voves than are esteemed true
Then sayes he must be gone, and then doth finde
Something he should have spoke that's out of minde,
And whilst he stands to looke for't in her eyes,
Their fid sweet glance so tyie his faculties,
To thinke from what he parts, that he is now
As farre from leaving her, or knowing how
As when he came; begins his former strain,
To kisse, to vow, and take his leave againe.

Then turnes, comes backe, fighes, parts; and yet doth goe, Apt to retire, and loath to leave her fo.

BRUCHUS (*Encycl.*). To that article add the words, "See Plate 61."

BRUGGE, or **BRUGEN**, a town of Germany, in the circle of Lower Saxony and bishopric of Hildesheim, six miles from the city of that name. Long. 10. 5. E. Lat. 52. 6. N.

BRUNETO, an episcopal town of Italy, in the territory of Genoa, at the foot of the Apennines, thirty-five miles south-east of Genoa. Long. 9. 30. E. Lat. 44. 15. N.

BRUN (Anthony le), an ambassador of Spain, famous for his skill in negotiating, was of an ancient and noble family, and born at Dole in the year 1600. He was attorney-general in the parliament of Dole; during which time he had a hand in all the state negotiations which concerned the provinces. He was sent afterwards by Philip IV. to the diet of Ratisbon, and from thence to the court of the emperor Ferdinand III. He was one of the plenipotentiaries of his Catholic majesty, at the conferences of Munster held in 1643; where, though all the other plenipotentiaries took place of him, yet it is said that he far exceeded them all in capacity. The king of Spain was particularly beholden to him for the peace which the Dutch made at Munster, exclusively of France; and the intriguing turn which he shewed upon this occasion made him dreaded ever after by French ambassadors. He was a man of letters, as well as of politics; and therefore employed his pen, as well as his tongue, in the service of his master. He died at the Hague, during his embassy, in the year 1654.

BRUNDISIUM, or **BRUNDISIUM** (anc. geog.), a town of Calabria, with the best harbour in Italy. It was a very ancient town, and belonged originally to the Salentines; but was taken by the Romans about 256 years before Christ. Now *Brindisi*; which see.

BRUNETTO, a strong and important place in Piedmont, near Susa, which it defends.

BRUTII, an ancient people of Italy, inhabiting the country now called *Calabria Ultra*; different from the ancient Calabria, or *Messapia*, to the east on the Adriatic or Ionian sea.

BRUTUS (Lucius Junius), the avenger of the rape of Lucretia, and founder of the Roman republic, flourished 509 years before Christ.

BRUTUS (Marcus), the passionate lover of his country, and chief conspirator against Cæsar, slew himself on losing the battle of Philippi, forty-two years before Christ.

BRUTUS (Stephen Junius), the disguised author of a political work in titled *Vindicia contra tyrannos*.

BRYENNIUS (Nicephorus), a prince distinguished by his courage, probity, and learning, was born at Orestia in Macedonia; where his father by rebellion provoked the emperor to send his general Alexis Comnenus against him, who ordered his eyes to be pulled out: but being charmed with his son Bryennius, he married him to Anne Comnenus his daughter, so famous by her writings. When Alexis came to the throne, he gave Bryennius the title of *Cæsar*; but would not declare him his successor, though solicited to it by the empress Irene; and was therefore succeeded by his son John Comnenus, to whom Bryennius behaved with the utmost fidelity. Being sent about the year 1137 to besiege Antioch, he fell sick; and returning, died at Constantinople. This prince wrote the *History of Alexis Comnenus*, which he composed at the request of his mother-in-law the empress Irene.

BÜCHORN, a free and imperial town of Germany, in

the circle of Suabia, on the lake of Constance, 18 miles E. of Constance. Long. 9. 42. E. Lat. 47. 41. N.

BUEN RETIRO, a palace of the king of Spain, on the E. side of Madrid: it is a perfect square, and at each angle is a pavilion. It is generally the residence of the king in the spring, and part of the summer.

BUCK-BEAN (*Encycl.*), read *Buck-BEAN*.

BUILDING (*Encycl.*). From the description given in the 493d number of the *Philosophical Transactions*, by Mr. ARDERON, it appears that the ruins of two old towers, belonging to the Roman camp at Caistor, in Norfolk, were built in the following ingenious manner: they began first with a layer of bricks, laid flat as in pavements; on that they placed a layer of clay and marl mixed together, and of the same thickness with the bricks; then a layer of bricks, afterwards of clay and marl, then of bricks again; making in the whole three layers of bricks, and two of clay. Over this were placed bricks and lime twenty-nine inches, the outside being faced with bricks cut in squares; then brick and clay alternately, as high as the old ruins now remain standing. He adds some remarks on the hardness of the mortar, and durability of the bricks, the length of which last is found to be 17,4-tenths inches, or a Roman foot and a half; their breadth 11,6-tenths inches, or precisely a Roman foot; and their thickness only 1,3-tenths of an inch.

Many compositions have, with more or less success, been devised for making mortar impenetrable to moisture. The following we believe is one of the most simple and effectual: mix thoroughly one-fourth of fresh unslaked lime with three-fourths of sand; and let five labourers make mortar of these ingredients, by pouring on water, with trowels, to supply one mason, who must, when the materials are sufficiently mixed, apply it instantly as cement or plaster, and it will become hard as stone. This recipe is given by Mr. R. DOSSETT, in his second volume of "Memoirs of Agriculture and other Economical Arts," 1771. The author, on this occasion, observes that the lime used should be stone-lime; that previous to its use, it should be preserved from the access of air or wet, and the plaster screened for some time from the sun and wind. He justly remarks, that its excellence arises from the particular attraction between lime and sand; which would be destroyed by slackening the lime. Skimmed milk (says he) is preferable to water; and for the similarity of this mortar to that of the ancients, he refers us to Pliny, Vitruvius, &c.

Another very durable and cheap cement in building, which is particularly designed as a handsome coping of walls, is that of the late P. Wych, Esq. Take four or five bushels of such plaster as is commonly burnt for floors about Nottingham (or according to Mr. Dossie, a similar quantity of any tarras, plaster, or calcined gypsum); beat it to fine powder; then sift and put it into a trough, and mix with it one bushel of pure coal ashes, well calcined. Pour on the water, till the whole becomes good mortar. Lay this in wooden frames of twelve feet in length on the walls, well smoothed with common mortar and dry, the thickness of two inches at each side, and three inches in the middle. When the frame is moved to proceed with the work, leave an interval of two inches for this coping to extend itself, so as to meet the last frame-work.

In December 1780, Dr. R. Williams obtained the king's patent for his invention of a mortar or stucco for the purpose of buildings. As the term of the exclusive privilege of using this composition is now expired, we shall give the following particulars: take of sharp, rough, large grained sand, sifted, washed, dried, and freed from all impurities; of well-burnt lime, slaked and finely sifted; of curd, or cheese, pro-

duced from milk; (the first, fresh made and strongly pressed, to divest it of its whey; the second, whilst perfectly sound, raised into powder with a grater, or brought into a very light substance with scrapers, or fine-toothed planeirons, in a turner's lathe); and lastly, of water in its natural state, in the following proportions, viz. of the cheese, or curd, four pounds; the lime twelve pounds; the sand eighty-four pounds; the water ten pounds. If the sand is not thoroughly dried, or the lime has got damp from the air, the quantity of water must be less than the above proportion; and, on the contrary, when the lime is used immediately, it may require more; so that the proper stiffness of the mortar, under those circumstances, will regulate the making of the composition.

As the goodness of this mortar depends on the preservation of the natural properties of the cheese, or curd, made use of, all those parts the least tainted or rotten must be rejected; and as the cheese, like the curd produced from skim-milk, is divested of its buttery and oily particles, and on that account possesses a powerful cohesive quality, which makes it better for this work than that made of milk in its rich and pure state; it is at all times to be bought of the wholesale cheese-mongers at a lower price than any other; and being more convenient than the curd, as that will require frequent making, is to be preferred to it, as well as to every other sort of cheese; for less of it is sufficient, only four pounds being allowed to the nett hundred weight of all the solid ingredients; more than which might make mortar too lively to keep in its place without bagging, but less should not be used; as that, on the other hand, would endanger its drying loose and gritty within its surface, hinder it from adhering properly to the walls, and thus reduce it to the level of common mortar. Many tedious and trivial rules are stated by the patentee, relative to the manner of applying this cement, and its preservation in boxes for ready use. Those who wish to acquire additional information concerning this subject, may find the specification of the patent, at full length, in the third volume of the "Repertory of Arts and Manufactures."

In July, 1796, Mr. H. Walker, of Thurmaston, Leicestershire, procured a patent for his invention of a method, by which houses and other buildings, of any description or dimensions, might be erected in one entire mass or body, at a much easier expence, especially in the articles of timber, lime, and workmanship, and which would be equally as durable in themselves, and less liable to accidents by fire, than buildings erected upon the common construction. His process is as follows:

1. The patentee takes an argillaceous earth or natural clay, which he purifies by the usual well-known methods, and compounds it with sand, or broken or pounded pottery or brick, coal-ashes, charcoal, or, in short, with any other of those substances which are adapted to form a good, firm, and durable brick, when properly baked; and he varies the composition according to the nature of the component parts themselves, and the purposes which they are intended to answer; but, for common constructions, he uses the same proportions as brick-makers in general. He then proceeds to mix, knead, and incorporate the said materials, till they are brought to the requisite firmness and tenacity for building; which is nearly such, that the parts of any lump or mass of the same may be readily incorporated with, or joined to, any other similar mass, by moderate blows with a wooden mallet, and the occasional addition of a very small portion of water: this composition he calls the prepared material.

2. He constructs floors, walls, and all other buildings, according to this invention, in such a manner that the power of fire, from wood, coal, charcoal, coak, or other

combustible matters, may be applied to the external and interior surfaces of the floors, walls, and other parts, by means of fires maintained in cavities left within, which he calls by the name of furnaces.

3. With respect to the particular forms, dimensions, and relative positions of the said floors, walls, and other parts of buildings, and the furnaces left or formed within the same, together with the apertures or communications, for the purposes of ventilating the fires, of suffering the volatile matters to escape, and of converting the whole into one entire mass of brick, by a due communication and continuance of heat, Mr. Walker says, the ground must be rendered solid, and the foundation laid in the usual manner; after which he applies a quantity of the prepared material before alluded to, and beats, rams, or presses it down to the thickness of about six inches; and in width, corresponding with the intended dimensions of the wall, regulated by boards or framing. He then plants upright, at a distance of about thirty inches asunder, in the said layer or bed of prepared material, a number of cylindrical pieces of wood, of about nine inches in diameter each, and eighteen or more inches in length, to serve as moulds for the cavities of the furnaces; and between each of such moulds he places, in the longitudinal direction of the wall, a number of pipes of wood, or other materials, or rods, of combustible or incombustible matter, for the purpose of forming communications between all the several furnaces, or as many of them as he thinks proper. Then he proceeds to form another layer or bed of the material, to the same height, namely, about six inches, and disposes a number of such pipes, or rods for the purpose of forming similar communications. In this manner he constructs the whole, or so much of the wall as he apprehends, all the time, may be conveniently formed, in the raw or unburnt state; taking care, as the work advances, to raise the wooden cylinders, or moulds, that a sufficient portion of them may remain above the surface of the work to admit the reception and proper fashioning of each subsequent layer; or he forms the communications between the furnaces, by perforating the wooden moulds, in various places, at right angles to their respective axes; and through the said perforations he passes a bar of iron, or other material, which serves to connect three or more of the said furnace-moulds, and being afterwards withdrawn, as the work proceeds, leaves cavities of communication, similar to those formed by pipes, rods, &c. in the manner before described. Further, he opens such a number of horizontal or oblique apertures, or flues, into all the furnaces, and likewise into all the cavities, as may be requisite for admitting, on all sides, the excess of atmospheric air. In some instances, he forms horizontal or oblique apertures or flues, by disposing, along with the pipes, a suitable number of taper rods, which are afterwards extracted.

4. When the wall is built, he either suffers it spontaneously to dry, or promotes this effect by moderate fires in the furnaces. Sometimes by increasing the heat within, and at others by suitable applications of fire externally, he converts the whole into one entire mass of brick. By occasional closing or opening of the furnaces at top, or any of the other apertures, in various parts, the intelligent operator will easily understand how to regulate the progress, communication, and effect of the heat, that the conversion into brick may be uniform through the entire mass.

5. The dimensions of the furnaces, the positions and relative distances of the pipes of communication and lateral apertures, and the thickness of the layers of the prepared material, are each susceptible of great variation, according to the nature of this preparation, the activity of the fuel, the proposed solidity or figure of the work, &c.

6. He then forms the remaining parts of the wall, or edifice, by applying additional portions of the prepared material in contact with that already baked; while he also avails himself of proper and suitable external and internal moulds, supports, frames, and other occasional contrivances, well known to builders, for sustaining works, or forming arches, or determining the figure and positions of soft plastic substances.

7. The ground-floor is likewise formed of the prepared material, leaving hollow spaces between the supports beneath, for making fires, ventilated by side apertures, which are provided with numerous holes. When the floor is of considerable thickness, it will require the construction of furnaces in every respect similar to those before described.

8. The first above the ground floor is made upon suitable temporary framing, in such a manner that the upper surface shall be plane, and the lower concave, so that it may, when baked, support itself upon the principle of a low arch.

9. and 10. The patentee constructs, bakes, or burns other floors above the first, and also the roof, &c.; he closes the apertures, fills up the furnaces, amends the deficiencies, adorns the walls, floors, ceilings, or other parts, with his prepared material, according to the taste and direction of the proprietor.

Various plans have lately been devised for securing buildings, and ships, against fire. We shall, however, mention only that of David Hartley, Esq. who, in April, 1773, obtained a patent for his invention of applying plates of metal and wire, varnished or unvarnished, to the several parts of buildings or ships, so as to prevent the access of fire, and the current of air; securing to the several joints by doubling in, over-lapping, folding, rivetting, or in any other manner closing them up; nailing, screwing, sewing, or otherwise fastening, the said plates of metal in, to, and about, the several parts of buildings, and ships, as the case may require.

BULAM, or BULAMA, as it is more usually called, forms part of the Archipelago, or cluster of Islands, lying on the western or windward coast of Africa, and known by the name of the *Bissaos* or *Bissagos*, which are supposed to have been celebrated by the ancients under the appellation of the *Hesperides*. It is situated at the mouth of the Rio Grande, in 11° N. Lat. and 15° W. Long. from the meridian of London; and is between seventeen and eighteen leagues long, and from four to five broad.

This island has become an interesting object to the inhabitants of Great Britain, in consequence of its having been purchased in the year 1792 by a society instituted for the same humane purposes with those which gave rise to the *Sierre Leone* Company. The Bulam association was formed towards the latter end of the year 1791; and they were induced to pitch upon that island as the most eligible tract for their intended colony, in consequence of the flattering description given of its climate, soil, and harbours, by M. Brue, formerly director-general of the French African companies.

The original trustees for managing the concerns of the association at home were, Paul Le Mesurier, M.P.; James Kirkpatrick, Esq. George Hartwell, Esq. Moses Ximenes, Esq. Sir John Riggs Miller, Bart. and David Scott, Esq. M.P.; and for establishing the colony, and conducting the affairs of the society abroad, the following gentlemen were nominated, viz. Messrs. H. H. Dalrymple, John Young, Sir William Halton, Bart. John King, Philip Beaver, Peter Clutterbuck, Nicholas Bayly, Francis Brodie, Charles Drake, John Paiba, Richard Hancorne, Robert Dobbins, and Isaac Ximenes.

A sum of 5000*l.* being quickly subscribed for the establishment of the intended colony, this committee failed from

Spithead in three ships on the 11th of April, 1792; and landing in due time at Bulama, they purchased that island from the kings of Canabac, who claimed it as their property. They purchased likewise from the kings of Ghinala the neighbouring island Arcas, and the adjacent land on the continent; and these several purchases being taken possession of in the usual form, a body of settlers, consisting of forty-nine men, thirteen women, and twenty-nine children, were left at Bulama under the superintendence of Mr. Beaver, with a temporary supply of provisions, stores, plantation-tools, and merchandize, for trading with the neighbouring natives. It is from the dispatches of these settlers, after having lived some time in Bulama, that the following account of the island was drawn up by Mr. Johanfen.

"The climate, on the whole, may be deemed salubrious, and will become more so in proportion to the increase of cultivation. The mornings and evenings are temperate and pleasant; the middle of the day is hot, but the fine sea breeze which then sets in tends greatly to cool and refresh the air. The heat of the sun is not either too excessive or intolerable as has been generally supposed; indeed nature has most admirably adapted our mechanical and physical qualities to the exigencies of different regions; and man, who is the inhabitant of every climate, may, in some measure, render himself indigenous to every soil. Here the only danger arises from too sudden an exposure to the operation of the vertical rays of the sun, or an excess of labour; both of which the first settlers ought most studiously to avoid.

"It appears from Mr. Beaver's observations at noon, between the 20th of July, 1792, and the 28th of April, 1793, that the thermometer, when lowest, was at seventy-four; the medium heat eighty-five; and that it never exceeded ninety-six, except at one time when it rose to 100, during a calm that occurred in the interval between the north-east breeze in the morning, and the south-west in the evening of the 19th of February, 1793. The difference between the heat of noon and that of the morning and evening is from twenty to thirty degrees. On the 23d of October, 1792, hail of the size of a pin's head fell during two minutes, although not a cloud was to be seen during this phenomenon. The mercury in the thermometer then stood at eighty-five; the wind was at north-east in the morning, and south-west in the evening.

"Immediately after sun-set a dew constantly begins to fall, which induces some to light a fire in their houses; they at the same time put on warmer clothing. There is little or no twilight; and night and day are nearly equal: the earth has therefore time to cool during twelve hours absence of the sun.

"None of those terrible and destructive hurricanes so frequently experienced in the West Indies are to be met with here. The *tornadoes*, which arise chiefly from the eastern point of the compass, are but of short duration, seldom lasting above an hour, and may be readily foreseen some time previously to their commencement. They occur at the beginning and close of the wet season, and are highly beneficial, as they purify the air, and dispel the noxious vapours with which it would otherwise abound.

"The rains set in about the latter end of May or the beginning of June, and discontinue in October or November. They do not fall every day, for there is often a considerable interval of clear weather, during which the atmosphere is beautifully serene; the showers in the first and last month occur but seldom, and are far from being violent; while, on the other hand, they sometimes resemble torrents, more especially towards the middle of the season. During the whole of this period, Europeans should, if possible, confine themselves to their habitations, as the rains prove injurious to health,

more especially if those exposed to them neglect to wipe their bodies dry, and to change their clothes immediately on their return home. It is deemed prudent also not to dig the earth until the expiration of a month after the return of fair weather, as this is considered to be unhealthy.

"During the continuance of the dry season, a dew falls during the night, in sufficient quantity to answer all the purposes of vegetation.

"Every stranger is generally here, as well as in the West Indies, subject to a fever or *jaquining* on his arrival. This is not infectious; it proceeds perhaps from an increased perspiration and a sudden extension of the pores of the human body, in consequence of the heat, by which means it is rendered more liable to imbibe the abundant exhalations that arise from the animal, vegetable, and mineral kingdoms; but even this, slight as it is, might doubtless be avoided by means of a proper regimen, and a short seclusion from the full action of the open air, more especially at noon, and during the evening, until the climate has been rendered familiar.

"Bulama is admirably adapted for all the purposes of an extensive commerce, being not only happily situated at the mouth of the Rio Granda, but in the vicinity of several other navigable rivers; so that a trade with the internal parts of Africa is thereby greatly facilitated. The landing is remarkably easy and safe, there being no surge; the ebb and flow is regular, and there is an increase of sixteen feet of water at spring tide. The bay opposite the Great Bulama is adorned with a number of islands, covered with trees, and forms a most excellent harbour, sufficiently capacious to contain the whole navy of Great Britain, which might ride there in safety. The settlement in general is well supplied with water. A number of springs have lately been discovered in different places; and besides a draw-well in the fort, which was erected for the defence of the colony, there is a small stream, which runs into Elewis Bay, near the new settlement called Heper Elewis: this is admirably situated for the supply of shipping.

"The island is beautifully surrounded, and interspersed with woods: lofty fruit and forest trees, mostly free from underwood and brambles, form a verdant belt, in some places two or three miles broad, which entirely encircles it, in such a manner as to represent a plantation artificially formed around a park. Within this the fields are regularly divided by trees, so as to resemble the hedge-rows in England. The beach has in some places the appearance of gravel walks; it is fringed with mangrove trees, which forming a line with the high-water mark, dip their branches into the sea, and thus afford nourishment to the oysters that often adhere to their extremities.

"Several parts of Bulama have been occasionally cultivated by the neighbouring blacks, though they did not constantly reside on it.

"The land in general rises gradually towards the middle of the island, where the highest spot is from sixty to 100 feet above the level of the sea. The small hill on which the fort is situated is nearly of the same altitude.

"The soil is abundantly rich and deep; stones do not here impede the labours of the farmer; and indeed none have hitherto been discovered, but a small fort, resembling pieces of ore, which are to be met with on the shore. There are many *jacannas* or natural meadows, so extensive that the eye can scarcely discern their boundaries. These are admirably adapted for the rearing of stock and feeding of cattle of every kind.

"Cotton, indigo, rice, and coffee, grow spontaneously on this coast; the sugar-cane is indigenous to many parts of

Africa, and might be cultivated here by the labour of freemen, in equal perfection, and to much greater advantage, than in the exhausted islands of the West Indies. All kinds of tropical productions, such as pine-apples, limes, oranges, grapes, plums, cassia, guava, Indian wheat, the papaw, water-melon, musk-melon, the pumpkin, tamarind, banana, and numbers of other delicious fruits, all flourish here. The adjoining territories produce many valuable sorts of spices, gums, and materials for dyeing: all of which, it is but fair to suppose, might be readily cultivated in a kindred climate and a congenial soil.

"The neighbouring seas abound with a variety of fish, highly agreeable to the palate. The lion, tyger, jackall, &c. are natives of the continent; but in Bulama no animals have been discovered, the wolf, some buffaloes, a few elephants, and a species of the deer excepted.

"The woods abound with doves, guinea-fowls, and a variety of birds, celebrated for the beauty of their plumage.

"The natives of this part of Africa, like all savages, are entirely under the dominion of their passions: hence the violence of their attachment to their friends, and the excess of their resentment against their enemies. Their notions of property are very obscure and confused: they have no idea of any right arising from occupancy or improvement. What they want, they either receive or take wherever they may happen to meet with it, and they permit others to do the same. They have been taught by experience, that the Europeans will not agree to this: against them therefore they employ every artifice that it is in the power of cunning to suggest.

"The colonists need not fear any attack on the part of the negroes, provided their own conduct be just and peaceable: for Mr. Beaver, who was indeed admirably calculated by nature and habit for the station he occupied, could insure both safety and respect when the settlers under him were reduced to four white men, although the neighbouring nations knew that he was in possession of commodities, for the acquisition of which many of them had become day-labourers. He often kept from twenty to forty gronittos, or black cultivators in pay, at that very period, at about four or five bars each per month. A bar is about the value of three shillings and six pence. These are easy to be procured, to almost any number that can possibly be wanted.

"Until a sufficient quantity of stock and provisions can be raised in the company's settlements, the adjacent islands will furnish abundance of cattle, hogs, fowls, &c. at a very cheap rate. A horse may be purchased at Goree for *tl.* 10s. a bullock may be had from 12s. to 18s. sterling: provisions of all kinds are equally reasonable. Honey is also to be procured in great plenty, and bees-wax may be rendered an advantageous object of commercial speculation.

"In short, the acquisition of Bulama, Arcas, and the adjacent territories, presents the fairest opportunity of furnishing Europe with many valuable articles that have hitherto been brought from more remote countries, with much greater hazard, and at an increased expence. The intercourse with England is easy, safe, and expeditious; for the voyage may be performed in the space of three or four weeks: and by the terms of the first subscription, a settler on Bulama might purchase 500 acres of land for 30*l.* sterling, by the terms of the second, which we suppose are the terms at present, he might purchase on the islands of Bulama and Arcas, or on that part of the adjacent coast which was ceded to the society by the kings of Ghinala, 200 acres for 50*l.* sterling.

"The colonization of Africa opens a noble and extensive field to nations and to individuals. To people those fertile territories, despoiled of their inhabitants by the slave-trade; to

year the productions of the climes between the tropics, by the assistance of free men; to give ample scope to the industry and exertions of those who may be inclined to remove from Great Britain; and to extend the commerce and the manufactures of our native country—these are subjects which have excited the attention of the Bulama association, and now claim the assistance of the ingenious, the support of the rich, and the concurrence and good wishes of all."

BULLER (Sir Francis), one of the judges of the court of Common Pleas, long celebrated for the extent and correctness of his judicious knowledge, was the second son of James Buller, Esq. member of parliament for Cornwall, by his second wife Jane, daughter of Allen, Earl of Bathurst.

Sir Francis Buller received a classical education at a private school in the west of England, and having elected the law for his profession, was entered in the Temple, under the pupilage of Mr. (afterwards judge) Ashurst. He was early distinguished for great depth of knowledge, and professional accuracy; and for some years before he was called to the bar, practised with great success as a special pleader. Fashion, and the indiscriminate use of a phrase which is little understood, have occasioned somewhat of contempt to be attached to the reputation of a special pleader: by some, special pleading is understood to mean nothing more than a proficiency in the science of chicane, and a facility of exerting technical knowledge in enabling iniquity and injustice to triumph over candour and good faith; by others it is considered as a mere accumulation of jargon without any exact meaning, and without any other result than the increase of expence, and the delay of justice. Those who make these applications of the term, speak from the abuse against the science. Special pleading, or rather the art of drawing pleas, is founded on the strictest, and, at the same time, most liberal rules of logic. It implies not only a correct and minute, but a vigorous and comprehensive, mind; not only a talent for perceiving the shades of difference which are found between the extremes of right and wrong, but a great degree of readiness in applying them to a particular case. The nervous exercise of vigorous and manly eloquence obtains greater applause, and produces a more perceptible effect on the minds of juries; but in vain does the advocate obtain a verdict at *Nisi Prius*, if the correctness of the special pleader has not laid the foundation on which the superstructure of ultimate success must be raised; nor is the support of the throne of justice, and the final adjudication of the law, ordinarily committed to those orators whose talents have been most admired at *Nisi Prius*, but to those who, by their skill in special pleading, have evinced that laborious attention and precise information, without which justice may be perverted, and the judgment led captive by the imagination.

While Mr. Buller practised as a special pleader, Mr. Erskine was numbered among his pupils. In Easter term, 1772, he was called to the bar, and in the same year published his "Introduction to the Law of *Nisi Prius*;" a work which reflects the greatest honour on his learning, judgment, and ability; it still remains in high repute, and although Mr. Espinasse has published a very laborious and successful work on the same subject, Buller's *Nisi Prius* is, and perhaps always will be, a book in great demand and high estimation.

Mr. Buller's progress at the bar was extremely rapid: he is said to have owed much of his success to parliamentary connection; but this appears to be one of those fictions by which dunces attempt to depreciate genius when it has met its due reward. Mr. Buller was never in parliament, nor was he ever a conspicuous supporter of any ministers or their measures. Lord Mansfield, though an active and able politician, was not subject to be biased on the judgment-seat by his political pre-

dilections; at least, not in such a way as make coincidence a motive of personal preference. In Michaelmas term, 1777, he was honoured with a silk gown, and in three days after his promotion (27th November) made second judge of Cheffer. In the ensuing Easter term, a vacancy arising by the death of Sir Richard Ashton, Mr. Buller was, at the express and earnest recommendation of Lord Mansfield, advanced to the bench.

In this court, judge Buller sat for sixteen years, and his conduct abundantly verified the high hopes entertained of his abilities. Lord Mansfield supported his early exertions with all the weight of his authority, all the persuasion of his irrefragable eloquence: and when in the evening of his days that truly great character was frequently obliged to seek a temporary respite from the fatigues of his station, his place was supplied by Judge Buller, with a degree of ability and integrity which left little room for regretting the absence of the principal. Lord Mansfield was so entirely convinced of his ability, that he is said to have exerted all his influence, and to have even held his office after the power to execute its functions had ceased, for the purpose of obtaining the succession to Sir Francis Buller.

His efforts failed, but this was not the only instance in which a marked predilection was shewn for Buller's talents: he was often deputed by Lord Thurlow to sit in the Court of Chancery; and during the interval between the resignation of Lord Thurlow and the appointment of Lord Loughborough, Judge Buller was one of the commissioners of the great seal.

In Trinity term, 1794, finding the business of the court of King's-bench too multifarious for his state of health, he exchanged situations with Sir Soulden Lawrence, who had recently been made a judge; and sat in the court till the end of his days.

Sir Francis was always celebrated for his ready perception of the real point in a cause, his penetration in detecting the fallacies of advocates, and the equivocations of witnesses, and his clearness in explaining his opinions to the jury. His integrity is not commended, because no British judge has been known since the revolution to want that quality. The detractors of Buller, and detractors every man in an exalted situation must expect, have imputed to him somewhat too much of severity in criminal cases; but this insinuation is not founded on any cogent proof: one case alone is cited, but the public seems long since to have acquiesced in the justice of Donnellan's sentence. In the year 1785, Judge Buller encountered much obloquy on account of an altercation with Mr. Erskine, on the trial of the Dean of St. Asaph; but the heat of political dispute had considerable effect, and the judge was unfairly balanced in the public mind against an able and popular advocate in a popular cause. In 1798 he was at the head of the commission for trying the state prisoners at Maidstone, and conducted himself with the most exemplary dignity, prudence, and moderation. This was the last conspicuous act of his public life. He died on Wednesday, the 4th of June, 1800.

In private he was amiable, gay, and benevolent; in person remarkably handsome, his complexion florid, his eye brilliant, and replete with sagacity and penetration. His health, during his latter years, was undermined by continual attacks of the gout; and at the time of his death, he intended to have resigned his situation of judge in a few days. His death was remarkably sudden; he fell from his chair while playing a game at picquet, and expired instantaneously. He was in his 55th year.

BULNESS, a village in Cumberland, at the end of the Picts wall, on the Solway Frith, whence Antoninus began his Itinerary, and whence the people say a paved causeway ran formerly along the shore of Elenborough, of which, though few tokens appear, yet tracks of streets, pieces of old

walls, and Roman coins, are often discovered in ploughing the fields.

BUNDELA, or **BUNDELCUND**, a territory of Hindoostan Proper, on the S.W. of the river Jumna, and separated from it by a narrow tract of low country. It is inhabited by a tribe of Rajpoots, and is surrounded by the dominions of Oude, Benares, and the Mahrattas. It was formerly subject to a rajah of the name of Hindooput, but is now equally divided among his sons, or their descendants. It is a mountainous tract, of more than 100 miles square, and contains the celebrated diamond mines of Panna, or Purna, with some strong fortresses. Chatterpou, which is reckoned the capital, lies in the parallel of 25° N.

BUNGO, a kingdom of Japan, in the island of Ximo, whose capital is Lunay. The king of this country was converted to Christianity, and sent an embassy to pope Gregory, in 1683; but there is not now one Christian in all Japan.

BUNIVA, a mountain of Greece, between Janna and Achaia, extending as far as the gulf of Zeiton. The ancient name was Eta; and it is famous for the narrow pass of Thermopylae (so called from the hot baths in the neighbourhood) where Leonidas, and his gallant 300 Spartans, resisted, for three days, the whole Persian army. This is the place, feigned by the ancients to be the scene of the death of Hercules.

BURAGRAG, a river of Barbary, in the kingdom of Fez, which falls into the Atlantic ocean, at the town of Sallee.

BURGAUW, a town and castle of Germany, in the circle of Suabia, capital of a margravate of the same name. It belongs to the house of Austria, and is 26 miles W. of Augsburg. Long. 10. 15. E. Lat. 48. 28. N.

BURG-CLERE, a village of Hampshire, situated on the W. of King's-Clere, at the foot of a hill, which has a military camp on the top, and an extensive prospect.

BURGH-UPON-SANDS, a village of Cumberland, near Solway Frith, where the victorious Edward the First died, in 1307, as he was preparing for an expedition against Scotland. It is five miles N.W. of Carlisle.

BURHANPOUR, a city of Hindoostan, in the Deccan, the capital of Candesh, and, at one period, of the Deccan also. It is still a flourishing city, situated in the midst of a delightful country, 225 miles E. by N. of Surat. Long. 76. 19. E. Lat. 21. 25. N.

BURKE (Edmund), a writer, orator, and statesman, of superior eminence, was born at Dublin on January 1, 1730. His father was an attorney of reputation, of the protestant persuasion. Edmund received the early part of his education under Abraham Shackleton, a quaker, who kept a school or academy at Ballyore near Carlow. If in this seminary he did not acquire that exactness of classical instruction, which is the pride of the public schools, it is probable that he was indebted to it for the rudiments of a larger plan of intellectual pursuit, which is often the advantage of a private institution. It is to the honour both of the master and the scholar, that for near forty years, the latter, in his visits to Ireland, used to travel many miles to pay his respects to the former, who lived to an advanced age. In 1746 Edmund entered at Dublin College as a scholar of the house. It does not appear that he distinguished himself in the studies and exercises of the place; but his mind was by no means unoccupied. He closely pursued a plan of study of his own choice, of which the principal objects were logic, metaphysics, morals, history, rhetoric, and composition. He seems to have left Dublin College after taking a bachelor's degree in 1749; and it has been commonly reported that he finished his studies in the Jesuits' College at St. Omer's. This circumstance, which has liberally been made a sort of charge against him, has been denied, apparently

on good grounds, by his biographers. Nothing, however, is recorded of him about this period of his life, but that he made an unsuccessful application for the vacant professorship of logic at the university of Glasgow. In 1753 he first entered upon the great theatre of London, as a law-student at the Temple. He soon became the wonder of his acquaintance for the brilliancy of his parts, and variety of his acquisitions; but, like many other nominal students of the law, he directed the force of his mind rather to general literature, than to studies properly professional. Indeed it appears probable that he was obliged to depend upon his pen for a support; for, soon after his settling in London, he became a regular writer in newspapers and magazines, which was a drudgery his genius would scarcely have submitted to, but for its emoluments. He was always industrious, and never wasted his time or spirits on the pursuits of fashionable dissipation. Yet he was not so much a recluse as to be a stranger to the societies of the gay and polite; and an intimacy with the celebrated actress Mrs. Woffington, whose conversation was at that time courted by men of wit as well as by men of pleasure, contributed to form his manners and expand his social talents. A state of ill health, into which assiduous application threw him, rendered him a guest in the house of Dr. Nugent, a physician, and was eventually the cause of his marriage with the doctor's daughter. This lady retained his esteem and affection during the whole of a long union. As she was a Roman-catholic, additional force was given by that connection to the prevailing notion of Mr. Burke's good-will towards that communion.

His first avowed work appeared in 1756. It was a pamphlet entitled, "A Vindication of natural Society; or, a View of the Miseries and Evils arising to Mankind from every Species of artificial Society; in a Letter to Lord ***," by a late noble Writer." This supposed noble writer was Lord Bolingbroke, whose manner of writing and reasoning Mr. Burke in this piece ironically imitated, in order to show, as he afterwards asserted, that the same arguments from abuse, with which that nobleman had attacked religion, might be equally employed against all civil and political institutions: and thereby to infer their fallacy. In so serious and forcible a strain, however, did Mr. Burke argue upon the evils of society, proceeding from the tyranny, injustice, and ambition of kings and governors, that the irony to many eyes was invisible; and the work has actually been republished in late times for the purpose of aiding the cause of a radical reform in human institutions. Whatever the author really meant by it, he certainly displayed great powers of writing and extensive knowledge; yet the work excited little notice, and it is only his subsequent fame that has made it an object of curiosity. For this disappointment, however, he was fully compensated by the reception of his next literary performance, the "Essay on the Sublime and Beautiful," published in 1757. The elegance of its language, and the spirit of philosophical investigation it displayed, at once raised its author to the first class among writers on topics of taste and criticism. The hypothesis he maintained concerning the objects of his enquiry was, that the principal source of the sublime is terror, or some sensation analogous to it; and that beauty is that quality, or the result of those qualities in objects, by which they excite love, or some similar affection. This theory is supported with much acuteness, and felicity of illustration; and though, like many other ingenious men, he has shewn too great a propensity to generalizing, it is certain that many of his observations are not less solid than elegant. The fame acquired by this work soon introduced the author to the best literary acquaintance. He became intimate in the house of Reynolds, afterwards Sir Joshua; and this connection, which lasted for life, was equally serviceable to the reputation of the one, and the pecuniary circumstances of the other.

Even the great Johnson courted his society, and there was no man of whose exalted talents he was more sensible. "Burke," said he, in his strong manner, "is one, with whom if you were to take shelter from a shower under a gateway, you would say you had been in company with the most extraordinary man you had ever seen." This praise implies not only uncommon qualifications, but as uncommon a readiness of displaying them; which, in fact, was one of Burke's striking distinctions. It is also said, that Johnson would more readily bear contradiction in opinion from Burke than from any other person; and that if he did not fear him, he was at least held by him in respect. In 1758 Burke suggested to Dodsley the bookfeller the plan of that valuable and entertaining work, the "Annual Register," and he took upon himself the writing of the historical part, which he continued for a number of years, greatly to the credit of the publication. It is allowed, that in no periodical work the narrative of the current transactions was ever given in a manner so nearly approaching to the dignity and consequence of history.

He was thus gradually forming for a statesman and orator; and his career may be said to have commenced in 1761, when he went over to Ireland as confidential friend to Mr. Hamilton, secretary to the lord-lieutenant, Lord Halifax. That gentleman, commonly known by the name of *single speech*, from a brilliant but sole display of his oratorical powers in the English House of Commons, was possessed of less industry than ability; and Mr. Burke is thought to have rendered him and the ministry some useful political services in Ireland, which were rewarded with a pension of 300*l.* on the Irish establishment. Soon after his return from that country in 1765, he was introduced by Mr. Fitzherbert to the Marquis of Rockingham, then appointed first lord of the treasury, who made him his private secretary; and through the interest of Lord Verney, he was elected representative for the borough of Wendover. The marquis, resolving durably to attach to himself a man of such first-rate talents, raised him at once to affluence by a nominal loan, but real gift, of a large sum, with which he was enabled to clear off incumbrances, and to purchase the elegant seat near Beaconsfield, where he thenceforth constantly resided. Mr. Burke was thus completely enlured into party, under an aristocratical influence, but at that time exerted in favour of popular measures. Before his political conduct is more particularly considered, it will be candid to furnish the reader with a kind of clue, which is contained in the character given of him by his early friend Mr. Hamilton: "Whatever opinion Burke, from any motive, supports, so ductile is his imagination, that he soon conceives it to be his right." This may be supposed chiefly applicable to the earlier part of his political life; yet it is sufficiently evident that his imagination had a great sway over his judgment to the last moment of his existence.

At this period the rising discontents in America were the great objects of interest to the nation. The stamp-act, imposed by the Grenville ministry, had kindled a flame among the colonists which threatened very serious consequences. Mr. Burke's first speech in parliament was on this subject, and it was much admired as a piece of eloquence. It was from his advice that the Rockingham administration took the middle and indecisive course of repealing the stamp-act, and passing a declaratory act, asserting the right of Great Britain to tax America; thus getting rid, indeed, of the present difficulty, but leaving to their successors the temptation of renewing a project which it was evident would be attended with a renewal of all the hazard and contention. The repeal, however, was an extreme popular measure at the time; and the ministry proceeded to other popular acts, as the repeal of the excise-tax, and the resolution against general warrants, when, after a

very short reign, they were turned out to make room for a new administration under the auspices of Mr. Pitt. It is allowed that Burke, though exhibiting great splendor of talents, was at this time too speculative and refined for real practice. He had, indeed, gone through a very different course of preparation for public life from that usually pursued. He had taken a wide range through all the studies which teach the nature, fortune, opinions, and principles, of mankind, and had employed himself in laying up those rich stores of knowledge, which he afterwards poured forth in such astonishing profusion. It was about this period that the character drawn for him by the poet Goldsmith, in the set of imaginary epigrams compiled for the several members of their celebrated literary club, appear to have been particularly applicable:

Here lies our good Edmund, whose genius was such,
We scarcely can praise it or blame it too much;
Who born for the universe, narrow'd his mind,
And to party gave up what was meant for mankind.
Though fraught with all learning, yet fraining his throat
To persuade Tommy Townsend to lend him a vote;
Who too deep for his hearers still went on refining,
And thought of convincing, while they thought of dining;
Though equal to all things, for all things unfit;
Too nice for a statesman; too proud for a wit;
For a patriot too cool; for a drudge disobedient;
And too fond of the right to pursue the expedient,
In short, 'twas his fate, unemployment or in place, fir,
To eat mutton cold, and cut blocks with a razor.

It is not intended in this biographical sketch to enter minutely into the political transactions of the time; it will suffice for our purpose to give a succinct view of the principles supported by Mr. Burke in that long warfare of opposition to ministerial measures in which he passed his best days. After concluding his official labours by a Short Account of a late short Administration, written with force and simplicity, he took his station, along with his discarded brethren, as a guardian of the people's rights and the public welfare, and a vigilant censor of the conduct of his successors. In the proceedings against Mr. Wilkes, and the case of the Middlesex election, Burke found large scope for blaming and ridiculing the policy of ministers; and he strenuously joined his efforts to those of the remonstrants against the violation of the rights of electors. About that time he published one of his most remarkable political works, entitled, *Thoughts on the Causes of the present Discontents*, which contains a large and explicit declaration of his ideas of the English constitution, and the mode by which power should be administered. He attributes all the evils and misgovernment of the reign to a plan formed by the court for governing by the private influence of its favourites, thus establishing a secret cabinet, always controlling the operations of the ostensible ministers, and dismissing them when not compliant with its designs. He shews in strong terms the incompatibility of such a secret influence with the principles of a free state; and supports some extremely popular notions concerning the House of Commons, which he says was originally designed as a "control, issuing immediately from the people, and speedily to be resolved into the mass whence it arose." Democratical as these sentiments may appear, his proposed remedy for the prevailing evils was perfectly aristocratical; since it consisted essentially in placing the government in the hands of the great whig families which had been the supporters of the revolution, and its consequent measures;—in other words, the Rockingham party. This narrow conclusion from enlarged principles gave great offence to many friends of freedom; and the celebrated Mrs. Macaulay wrote a pamphlet expressly in answer

to it, in which with much force and spirit he maintained her speculative notions on the great ends of government, and the equal rights of all citizens to participate in it. If it be of importance to acquit Mr. Burke of the charge of ever having been inclined to democracy in practice, certainly this publication may be confidently adduced as a proof of very different views. He was uniformly, however, the supporter of liberty, and the causes connected with it; freedom of the press, the rights of juries, and religious toleration: nor would his sincerity in these points ever have been questioned, had he not in his last years appeared as the champion of principles supposed directly adverse to them.

But the most lasting, as well as the strongest and noblest, of his parliamentary exertions, was his opposition to the train of ministerial measures antecedent and consequent to the American war. The whole powers of his eloquence, and the whole resources of his political wisdom, were employed first to prevent, and then to heal, the fatal breach between the mother country and her colonies; and to expose the misconduct and imbecility of those whom he considered as the authors of the calamity. And as this period comprised the full maturity of his oratorical abilities, it seems the proper place to describe the peculiar character of his oratory.

In all the records of eloquence an example probably is not found of a speaker so full of mind as Burke. Ideas and images crowd in upon him from all quarters. On every topic he not only takes in the whole compass of matter belonging to it, but makes excursions to a vast variety of subjects connected by the slightest associations. His diction is equally rich and varied with his matter. Figure rises after figure, image after image, in endless profusion; often splendid, sublime, and beautifully illustrative; not seldom coarse, disgusting, and puerile; for the rapidity of the current allowed him no time to select or purify. When he got up, it was scarcely possible for the audience to divine whither he would carry them; but they were sure of hearing nothing trite or common-place, and generally repaid for a patient attention, by striking and original sentiment, or deep and ingenious observation. From his speeches may be collected masterly discussions of almost every point interesting to human society, together with a great fund of historical narration and delineation of eminent characters. In argument he is often close and cogent, sometimes lax and sophistical. In praise and invective he is equally fervid and exuberant, exhausting all the tropes and epithets of language. In him feeling and fancy were alike potent, and daring vigour was allied with playful ingenuity. But oratory, as it was his forte, was also his foible. He loved too much to talk, and got the habit both of rising too often and staying up too long. His copiousness degenerated into prolixity; and after charming and convincing hearers with the beginning of his speech, he would tire them with the end. His vivacity and irritability rendered him not enough master of himself for a senatorial debator. He was sometimes hurried into violations of prudence and decorum, and said rash things in heat which he could not recal, and which could not be forgotten. His own party trembled to see him rise, and on many occasions would have preferred his silence to his aid. On the whole, he was not the most effective speaker of the house, though certainly the greatest genius. It may be added, that his manner was little in his favour; his voice was harsh, his tone natural, his action forcible, but strained and inelegant.

Mr. Burke's principles were supposed to be favourable to liberty, that in 1774 he was chosen member for Bristol, by the zealous and spontaneous efforts of the whigs and dissenters of

that opulent city. It does not appear, however, that, even in the great American contest, he ever explicitly declared himself concerning the fundamental rights of men in society. He was accustomed expressly to shun all such abstract questions, which he seemed to think dangerous and incapable of positive decision; and his attacks upon the measures of ministers were chiefly directed against their inexpediency, severity, and partial injustice. He very early proposed conciliation on the ground of renouncing future taxation, without discussing the question of right; though indeed he argued strongly against the assumed right of taxing *British subjects* who were unrepresented. It is needless here to say, that all the efforts of Burke and his friends were ineffectual. The war even became popular, and Burke seemed to lose ground in the public esteem by his opposition to it. He further gave offence to many, particularly his Bristol constituents, by his support of the Irish petitions for a free trade, and of a bill for taking off some hardships and penalties to which the Roman-catholics were exposed. He, however, recovered a large share of popularity by his famous bill of reform in the national expenditure, introduced in February 1780. In the framing of this bill, it was wonderful what minute accuracy of research he had employed; thus usefully proving, as he also did by the general tenor of his life, that the most brilliant imagination is not in the least incompatible with plodding industry. His speech on the bill was likewise remarkable by an extraordinary mixture of wit and humour with financial detail; an alliance no one but himself could or would have made. But though the idea of retrenchment was very grateful to the nation, it was not likely to be so to ministers and courtiers; and Burke's proposed bills were rejected.

In March 1782, an end was put to the ministry of Lord North, which was succeeded by the return of the Marquis of Rockingham and his party to power. Burke in this change obtained the lucrative post of paymaster to the forces, and a seat at the council-board. One of the first measures was the re-introduction of his reform bill, which passed, though not without considerable modifications. The death of the marquis, however, very soon put a period to this ministry; for upon the appointment of Lord Shelburne to succeed him as head of the treasury, instead of the Duke of Portland, several of the duke's friends resigned, and among them Mr. Burke. The Shelburne administration did not long survive the peace; and it was succeeded by that known by the name of the *Coalition*, as being composed in part of those former ministers who had been the objects of such a long and violent opposition, and in part of that opposition itself. The coalition was projected by Burke, who appears little to have calculated the effect upon the public mind of such a violent shock to all ideas of sincerity and consistency. It was, however, conformable enough to his old notion of governing by great families, and certainly still further absolves him from the charge of democratical principles. This association of power was dissolved by Mr. Fox's India bill, which had the warm support of Burke, but united against it both king and people. Mr. Pitt succeeded to the helm, and dissolved the parliament. This measure was attacked by Burke with great acrimony, and he moved a set of representations to the crown on the subject, one of which seems to go further in asserting the right of innovating upon established constitutions, than his usual latitude. He says, "Necessary reformation may hereafter require, as they have frequently done in former times, limitations and abridgments, and, in some cases, an entire extinction in some branch of prerogative." The grand desideratum of so many friends of freedom, parliamentary reform, was not however a species of alteration which he approved; and he opposed the plan for that purpose introduced by Mr. Pitt in 1785. Such a conduct was

consistent enough with the partisans of an aristocracy of borough-holding nobles.

The impeachment of the celebrated East-India governor, Mr. Hastings, was one of the great events of Burke's public life. He was the original promoter of it; and private motives of resentment were thought to have united with a regard to public justice in his pursuit of that national cause. He employed uncommon industry in collecting and arranging the materials of the charge, and followed it up with distinguished perseverance and ardour. His principal speech in support of the charge, was remarkable for violence and exaggeration; and upon the whole he was no gainer in the public estimation by this memorable impeachment, though perhaps the enormous length of the proceedings contributed more to render it unpopular than any well-grounded conviction of the innocence of the culprit.

The settling of the regency on the king's malady in 1788 was another subject in which Burke took a warm and active part. He contended vigorously against the minister's purpose of limiting the powers of the regent (the Prince of Wales), and his principle that the regency was elective and not hereditary. It is well known that the efforts of the opposition on this occasion were neither successful nor popular; and Burke expostulated himself to particular censure in consequence of some very unfeeling and irreverent expressions concerning the king, which escaped him in the vehemence of debate.

The last great act of Burke's political life was the part he took with respect to that mighty event, the French revolution. Though it might be supposed that one who had so long acted with the avowed friends of liberty at home, and had shewn such countenance to subjects whom oppression had driven into actual rebellion, would applaud the efforts of a great nation to found a free constitution out of the wrecks of absolute monarchy; yet, on the other hand, his constant unwillingness to resort to first principles, his reverence for established forms, and all the honours and splendors of civilized society, his contempt for the vulgar, and, it may be fairly added, his strong feelings of justice and humanity, might reasonably be expected to cause him to regard first with suspicion, and then with detestation, a revolution which soon betrayed symptoms of violence and a profligate spirit. He early manifested his dislike to it; and in February 1790, on a debate in the House of Commons concerning the reduction of the army, in which Mr. Fox recommended a generous confidence of this country towards the new rulers of France, he broke out into a virulent declamation against the original principles and the conduct of the French revolutionists, renounced personal friendship with Mr. Fox and those who supported the same opinions, and took his decided stand of hostility against every thing connected with the new order of things. From that time he sat down to the composition of his famous *Reflections on the Revolution in France*; on which he bent the utmost powers of his mind. It appeared in October, and no work perhaps ever excited more attention, or produced more effect. It is, in reality, a performance of wonderful vigour, displaying every characteristic excellence of the writer, and not a few of his defects. A liberal antagonist will not deny that it contains much justness of argument, much profundity of observation, with extraordinary beauties of language; while a judicious advocate will confess that it is not free from sophism and misrepresentation, and betrays a heated and ungoverned imagination. The most reprehensible circumstance is, that the writer, in his zeal to deviate as far as possible from principles which he thinks hurtful, uses arguments which would be applicable to the defence of the most tyrannical establishment, and to the condemnation of every struggle in favour of liberty. This work had a sale

almost unprecedented; and its author received the most unbounded praise from all those who were engaged in the support of establishments, and from many others, who were convinced by his arguments, and with him were shocked by the character the French revolution was daily assuming. On the other hand, it met with severe and formidable critics, and affixed, in the opinion of a numerous party, the stain of *apology* on the writer. It produced, among other replies, Paine's celebrated *Rights of Man*, which, for a time, seemed fully to balance its effects; but in the end, events, and the efforts of power and property, threw the preponderance in the scale of Burke; and it is not doubted that the turn he gave to the national opinions was an efficacious preparative to the ensuing war. He followed up his attack on the French principles, with *A Letter to a Member of the National Assembly*, in 1791; *An Appeal from the New Whigs to the Old*; *Letter to a noble Lord on the Subject in Discussion with the Duke of Bedford*; and *Thoughts on a Regicide Peace*; with several Memorials, &c. privately circulated; in all of which he displayed unabated powers of mind, together with such an earnest and inflamed zeal in the cause, as must remove all doubts of his sincerity. Indeed, enmity to the French revolution became the leading passion of his soul. He could not hear it named without violent irritation, and its success certainly embittered and disquieted all the concluding years of his life. Yet it must be allowed that his zeal was also invigorated by emolument. His hospitable disposition, and carelessness with regard to expence, had always rendered him a needy man; and the large pensions which were conferred upon him by the crown doubtless animated his love of royalty. These pensions were made a subject of severe animadversion in parliament, but he defended himself on their account with great vigour and spirit in his *Letter to a noble Lord*, above mentioned. The only other political object which occupied him during this period, was the emancipation of the Roman-catholics in Ireland from the disabilities they lay under, which he urged in *A Letter to Sir Hercules Langrishe, on the Propriety of admitting the Roman-catholics to the Elective Franchise*, 1792. He withdrew from parliament in 1794, and his seat for New Malton was occupied by his only son, a rising young man, whom his father viewed with the highest admiration as well as affection. The death of that son, soon after, was a most severe stroke upon him, and hastened the decline of nature he was beginning to feel. This, by gradual approaches, brought on a tranquil termination of his life on July 8, 1797, in the sixty-eighth year of his age. He preserved his senses to the last, and a few hours before his death caused to be read to him Addison's paper in the *Spectator*, on the immortality of the soul.

Mr. Burke was a very admirable man in private life, exemplary in his domestic and social relations, and greatly beloved by his friends, from several of whom he received substantial tokens of regard. His conversation was delightful, when not exasperated by inflammatory topics. He loved praise to a degree of weakness, and was not sparing in returning it. He had a very elegant taste for the fine arts, and was much attached to rural improvements, and the pursuits of agriculture. He was highly charitable and benevolent in his private capacity, and promoted many beneficent plans in his neighbourhood. The stream of his bounty latterly was directed to the relief of the sufferers from the French revolution, and he founded a school for the children of emigrants, the permanent support of which seems to have been one of his latest cares.

In addition to his literary exertions, it should be mentioned, that one of his biographers has asserted with the greatest confidence, that he was the real writer of Sir Joshua Reynolds's

Academical Discourses, that great artist having only contributed to the general plan, and the professional observations; and indeed the finished excellence of the composition, together with the great pecuniary favours he received from his friend, might render the supposition probable; yet it is strenuously denied by other authority. It is more certain that he had a great share in the composition of an admired account of the European settlements in America, undertaken by his cousin William Burke. The celebrated Letters of Junius were by many ascribed to Edmund Burke, at least as a leading associate in the design, and plausible arguments have been adduced for the opinion: but this literary mystery is yet untravelling. Other anonymous pieces of the political kind are known to have employed the masterly pen of Burke, as a principal or an auxiliary.—We are indebted to the popular work of Dr. Aikin, for the foregoing particulars.

BURKHAUSEN, a town of Germany, in Lower Bavaria, on the river Saltz, twenty-seven miles N. by W. of Saltzburg. Long. 12. 50. E. Lat. 40. 17. N.

BURMAH, an extensive kingdom of Asia, to the E. of the Ganges; sometimes, but erroneously, called Ava, from the name of its capital. It is bounded by Pegu on the S. and occupies both sides of the river Ava, as far as the frontiers of China. On the W. it has Aracan; and on the E. Upper Siam. This country, which is very little known to Europeans, produces some of the best teak timber in India. Ships built of teak, upward of forty years old, are no uncommon objects in the Indian seas, while an European-built ship is ruined there in five years. The forests which produce this valuable wood (which may be styled the *Indian oak*), are situated between the W. bank of the river Ava, and the country of Aracan, and are only 250 miles from the sea, by the course of the river.

BURNS (Robert). Scarcely any of the *self-taught* poets in any country have displayed so much real genius, or attained so much excellence, as the subject of the present article, who was the son of a gardener and small farmer, a native of the northern part of Scotland, but finally settled in the county of Ayr. Near the town of Ayr, Robert was born on January 29, 1759. He was brought up to rustic labour; but such a destination was not thought incompatible with that degree of literary education which is so general among the natives of Scotland. It appears that his father, a man of superior understanding, as well as of uncommon worth, exerted himself extraordinarily to procure instruction for his children; for, joining with some other heads of families of his own station, they engaged a master of considerable ability, under whom Robert became a very good English scholar, well grounded in the grammar, and possessed of a remarkable copiousness of words and expressions. His memory was retentive; and his love of reading, in proportion as proper objects were presented to him, became ardent. There was no great variety or choice among the books he first procured, nor does it appear that poetry was his earliest taste. The *Life of Hannibal*, and the *History of Sir William Wallace*, were his first favourites; and even polemical divinity, a topic of peculiar interest among his countrymen, was not without its attractions to him. In the mean time his imagination received a vigorous though homely food; from the conversation of an old woman resident in the family, who was plentifully stocked with the popular stories of fairies, witches, ghosts, and goblins, all which the piously believed. His father's circumstances did not permit Robert to enjoy a regular and unbroken course of instruction. It was interrupted by the necessity of early and hard labour; which, with poor diet, and melancholy prospects, fixed upon him a hypochondriacal tendency, that found its speediest cure in society and dissipation. The sum of direct instruction he received, included a smattering

ing of the French language, and some lessons in practical mathematics; but his own strong sense, with the aid of observation and casual reading, was continually making important additions to his mental stock. As he grew towards manhood, some of the best English poets came under his perusal; and he derived very essential benefit from a collection of letters by the most eminent writers, which by a lucky mistake fell into his hands, instead of a common introduction to the art of letter-writing.

His first poetical inspirer was Love, a passion of which he was ever singularly susceptible, and which formed much of the pleasure and pain of his life. A harvest companion gave him at fifteen the earliest impressions of this delicious emotion. She had several successors; but for a considerable time no other consequences ensued than the change of a topic for his verses. As he began to be known in the neighbourhood for strength of understanding and powers of conversation, his company was courted, and he too soon became initiated into riotous conviviality, though the love of company was long more prevalent over him than the love of drink. He has justly remarked, that his great misfortune at this period was the want of a fixed aim in life. His spirit rose above the meanness of his station. Though active in body, he could not submit to the thought of passing his whole existence in corporeal labour; yet no mode of elevating his condition presented itself. He made a trial at manufacture, and associated himself with a flax-dresser in the neighbouring town of Irvine; but the scheme ended in nothing but giving him a stronger relish for a town life. His reception among the fraternity of free-masons was an additional step towards his acquisition of convivial habits. After his father's death he joined his second brother in a small farm; but a course of bad seasons caused it to prove a losing concern, and they were obliged to give it up with the loss of their stock. During this period, he formed a connection with a young woman, which his circumstances, or his roving disposition, prevented him from improving into a legal union. When consequences ensued which could not be concealed, he endeavoured to ease his partner's mind by giving her an acknowledgment of a private marriage, which, upon information of his ruined condition, her parents induced her to resign. Poor Burns, now driven to utter despair, and having in prospect the horrors of a gaol, resolved to quit his native country, and actually engaged himself as assistant-overseer to a plantation in Jamaica. But he had for a considerable time been known in his neighbourhood as a maker of verses, and his compositions had become popular. Of these, some of the first were satirical effusions against the rigid Calvinistic clergy of the district, which, while they rendered the writer suspicious to the godly, were favourably received by those of a freer cast. Other pieces, humorous, descriptive, tender, and bacchanalian, were handed about and admired, and Burns himself began to think that he might lay some claim to the envied title of a poet. With the double view, therefore, of obtaining fame, and some pecuniary supply for his necessities, he resolved before his departure to publish a collection of such of his poems as he most approved; and in 1786 he printed a small volume at Kilmarnock, of which about 350 copies were subscribed for. When it is known that Halloween, the Address to the De'il, the Field Mouse, Mountain Daisy, and, above all, the Cotter's Saturday Night, were in this collection, it will not be wondered at, that they not only excited rustic admiration, but were perused with wondering applause by persons of the most refined taste. The local success was prodigious. The Ayrshire plowman became the pride of the country; and the labourer and maid-servant were impatient to convert a portion of their hard-earned gains into a copy of the delightful productions of the Scottish muse.

Burns, however, persisted in his purpose of quitting his native land; and with part of the sum his publication yielded, actually paid for his passage to the West Indies in a ship from the Clyde. "I had taken," says he, "the last farewell of my few friends; my chest was on the road to Greenock; I had composed the last long I should ever measure in Caledonia, 'The gloomy night is gathering fast;' when a letter from Dr. Blacklock to a friend of mine, overthrew all my schemes, by opening new prospects to my poetic ambition." That amiable poet, in common with some other persons of taste in Edinburgh, had been struck with the extraordinary merit of Burns, and had given his opinion that a visit to that capital would prove highly advantageous to him. Burns embraced the proposal with rapture, and posted to Edinburgh in November, 1786, relying solely on his fame, as he did not possess a single acquaintance in the place. His reception surpassed his most sanguine hopes. He was introduced to men of the first rank in letters, and to others of title and fortune; he was invited to all parties, praised, caressed, feasted, and more solidly encouraged by large subscriptions for a new edition of his poems. An ingenious periodical paper, entitled *The Lounger*, being about to conclude, one of its last numbers was devoted to a critique on the poetry of Burns, in which their peculiar excellences were amply displayed. In this new scene Burns exhibited a fund of manly sense and enlarged understanding, which rendered the man as much the object of admiration, as his *works* had been. The strength, purity, and fluency of his language in conversation, were thought particularly remarkable in one of his rank and education. His manners were simple and independent; he was above all the affected singularities of pretenders to genius: and though he sufficiently displayed a consciousness of his value, he was neither vain nor assuming. Nature had given him a countenance expressive and dignified, and a free cast of sentiment had taught him to hold up his head in the presence of his fellow-men; so that strangers who thought they were going to confer an honour on the peasant by their notice, were involuntarily awed by the first interview. The firmness of his mind, however, was not proof against the temptations to excess which assailed him from every quarter at Edinburgh. His social propensities were under continual stimulation, and the world of company obtained as easy a possession of him as the best. He passed the bounds of moderation in all his enjoyments, and his abode of two winters in the Scotch metropolis irretrievably fixed his unfortunate habits.

In February 1788, he found himself master of 500*l.* the fruits of that extraordinary encouragement which his new edition of poems had met with. Of this sum he advanced 200*l.* to his brother, the farmer; and with the remainder he took a considerable farm of a gentleman in Dumfriesshire, upon terms intended to be much in his favour. But it is evident that he himself at this time suspected that he should be unequal to the constant attention and industry which are absolutely requisite to produce success in the laborious and anxious occupation of agriculture. As a kind of *dernier resort*, he had employed all his interest to procure an appointment to the humble post of an exciseman, the highest, it seems, which the favour of the great could obtain for him. We may be surprised that a man of his character should be ambitious of an office which could not but hurt his generous feelings in its exercise, and completely destroyed his independence; and the fact can only be attributed to his melancholy forebodings with respect to the other plan. But his proposed union of the two employments was an absurdity which he obviously led to ruin, that his friends should have interferred to prevent it. Before settling, he took the honourable step of legalising, by a declaration of marriage, his connection with the female above men-

tioned, who had been absolutely turned out of doors by her father.

Burns for a time seemed to enjoy his rural and domestic pleasures, and worked cheerfully at his plough; but his fame and his habits drew him too often from his solitude to convivial company, and the unhappy excise business gave him too good a plea to quit his farm, and take up his abode at ale-houses. After three years and a half, he found it necessary to resign his lease into his landlord's hands, and remove to a small house in the town of Dumfries as a mere exciseman. One of the first troubles that followed him was a charge of diloyalty. Like most other ardent and ingenious spirits, he had been warmed to admiration of the beginning of the French revolution, and to concurrence in the principles on which it was founded. These he expressed with his usual freedom of speech, and his incautious language was reported to the board. This offence was much more heinous than the jacobinism of his younger days, which, indeed, was no more than a harmless play of romantic sentiment. A supervisor was appointed to enquire into his delinquency; and it was not without the intercession of a respectable friend, and promise of more guarded behaviour, that he was suffered to retain his situation. He afterwards wiped off all stain of diloyalty, so as to be placed on the list of expecting supervisors, though he did not live to attain his advancement. It would be painful to dwell upon the poor remnant of his life, in which he sunk into the habitual, forgetful of reputation, health, virtue, and the claims of those who ought to have been dearer to him. Even in this state of degradation; however, he exhibited admirable powers of the imagination, and his mind was vigorous while his body was daily becoming more feeble and diseased. He retained, too, a principle of honour in pecuniary matters, which preserved him from meanness even when oppressed with poverty. He was jealous of all offers of assistance, and long declined even the fair recompence of literary services. The latter years of his life were much occupied in lyric compositions, which he undertook at the request of a Mr. Thomson in Edinburgh, who was making an ample collection of Scottish song tunes, to many of which there existed either no words, or poor and improper ones. Burns engaged with ardour in this national work, waving all proposals of remuneration; and he poured forth a surprising number of pieces, many of them exquisite specimens of descriptive and sentimental beauty, clothed in language of touching simplicity and delicacy. He continued also to write to his correspondents letters full of fancy and energy. Several of these contain expressions of the keenest remorse for the faults he was daily committing; though neither that compunction, nor the religious sentiments with which he was permanently imbued, had power to overcome the force of habits, now become part of his nature. With respect to religion, though his mind had been early shocked with the horrors of the calvinistic faith, and he had been thrown into a state of doubt concerning revelation, yet he always cherished the hope and belief of a future life, as the only true solace under poverty and adversity; and many noble and pathetic declarations to this purpose are to be found in his letters. After much suffering from pain and depression, he died of the consequences of irregularities, in July 1796, in his thirty-eighth year. He left his wife and four children with no other provision than the interest inspired by a name endeared to the lovers of poetry, by performances never to be forgotten. This provision has proved not unfruitful. A considerable sum was raised for his family by subscription soon after his death; and Dr. Currie, an eminent physician at Liverpool, generously undertook to prepare for their benefit a complete edition of his works, which appeared in 1800, in 4 vols. 8vo. enriched with an ample account of his life, and

a criticism on his writings, with some observations on the character and condition of the Scottish peasantry; the whole forming a highly valuable addition to English literature.

The poems of Burns consist of pieces, none of considerable length, upon a great variety of subjects, and in very different styles. Most of them are written in the old Scottish dialect, and in figurative measures, of which he found the examples in Allan Ramsay's works. The best of them possess a vigour of imagination, a warmth of feeling, a happy simplicity and force of expression, that render them irresistibly engaging. It is difficult to determine whether he excels most in the sublime, the tender, or the humorous. In fact, in all these modes he drew his ideas immediately from nature, and animated them with the fire of genius. Though he can only rank among the minor poets, he will continue to be read and admired as long as poetry is relished, unless his productions should be prematurely hurried into oblivion by the use of an obscure and decaying dialect. His letters will by many be thought as extraordinary proofs of literary talents, superior to his situation, as his poems. They are in general written with a purity and command of language which would be admired in any condition; and they abound with passages of elegance, variety, and vigour, which genius alone could produce. With one of these, which may serve as a sketch of his own character drawn by himself, we shall conclude this article: "Take a being of our kind, give him a stronger imagination and more delicate sensibility, which between them will ever engender a more ungovernable set of passions than are the usual lot of man; implant in him an irresistible impulse to some idle vagary, such as, arranging wild flowers in fantastic nosegays, tracing the grasshopper to his haunt by his chirping notes, watching the frisks of the little minnows in the funny pool, or hunting after the intrigues of butterflies; in short, send him adrift after some pursuit which shall eternally mislead him from the paths of lucre, and yet curse him with a keener relish than any man living for the pleasures that lucre can bestow; lastly, fill up the measure of his woes by bestowing on him a spurning sense of his own dignity;—and you have created a wight nearly as miserable as the poet."—We are indebted to the popular biographical work of Dr. AIRIN, for the foregoing particulars.

BURNT ISLAND, a borough of Scotland, on the Frith of Forth, in Fifeshire. It has an excellent harbour, in form of a basin, where ships sometimes perform quarantine. It has a sugar-house, and some beginning manufactures. Near this place are found stones that appear to have been thrown out by a volcano. It is seated under a stupendous rock, ten miles N.W. of Edinburgh. Long. 3. 5. W. Lat. 56. 8. N.

BURRAMPOOTER, a river of Asia, which rises near the head of the Ganges, in the mountains of Thibet. Of these two rivers it is remarkable, that, issuing from opposite sides of the same ridge of mountains, they direct their course towards opposite quarters, till they are more than 1200 miles asunder; meeting in one point beyond the sea, after it has performed a winding course of more than 2000 miles. From its source, the Burrampooteer proceeds easterly

through Thibet, where it is named Sanpoo, or Zancin, that is, the *River*. After washing the border of the territory of Lassa, it takes a south-easterly course, and approaches within 220 miles of Yunan, the westernmost province of China. It then turns suddenly to the W. and proceeding through Aflamp, assumes the name of Carampooteer. It enters Bengal on the N. E. makes a circuit round the western point of the Garrow Mountains, and then, altering its course to S. meets the Ganges about forty miles through Bengal. This river bears so intimate a resemblance to the Ganges, except in one particular, that the same description might serve for both. The exception is, that during the last sixty miles before its junction with the Ganges, it forms a stream which is regularly from four to five miles wide; and, but for its freshness, might pass for an arm of the sea.

BUTRAGO, a town of Spain, in New Castille, formerly a bishop's see. It is seated on the river *Lozoya*, thirty miles N. by E. of Madrid. Long. 3. 5. W. Lat. 40. 46. N.

BUTTERMERE-WATER, a lake in Cumberland, about eight miles S. W. of Kelwick. It is two miles long, and not quite one broad. On the W. side it is terminated by a mountain, called, from its ferruginous colour, the Red Pike. A strip of cultivated ground adorns the E. shore. A group of houses, called Gategarth, is seated on the S. extremity, under a very extraordinary amphitheatre of mountainous rocks. Here Homister Crag is seen rising to a vast height, flanked by two conical mountains, Fleetwith on the E. and Scarf on the W. side. A hundred mountain torrents form never-failing cataracts, that thunder and foam down the centre of the rock, and form the lake below. Here the rocky scenes and mountain landscapes are diversified and contrasted with all that aggrandize the object in the most sublime style. This lake is called the Upper Lake; and, near a mile from it, to the N. E. is the Lower Lake, called also Cromack-water. The river Cooker flows through both these lakes to Cockermouth.

BYRON'S ISLAND, an island in the S. Pacific Ocean, discovered by Commodore Byron in 1765. It is low, full of wood, and very populous. On his approach to the island, several natives put off to the ship. After gazing at it some time, one of them suddenly sprung out of his canoe, into the sea, swam to the ship, ran up the side like a cat, and sitting down, when he got on deck, burst into a violent fit of laughter; then starting up, he ran all over the ship, attempting to steal whatever he could lay his hands upon, but being quite naked, he was always foiled. The seamen put a jacket and trowers on him, which caused great diversion, as he displayed all the antics of a monkey; at last he leaped overboard in this dress, and swam to his canoe. His success led several others to swim to the ship, and whatever they could seize they carried off with astonishing agility. These people are tall, well proportioned, and clean; their features good, and their countenance expressive of a surprising mixture of intrepidity and cheerfulness. Long. 173. 46. E. Lat. 1. 18. S.

BYZANTIUM. See CONSTANTINOPLE.

C A E

CABALLINUM (anc. geog.), a town of the Ædii in Gallia Celtica: now *Chalon sur Saone*, which see.

CABALLINUS (anc. geog.), a very clear fountain of mount Helicon in Boeotia; called *Hippocrene* by the Greeks; because opened by Pegasus on striking the rock with his hoof, and hence called *Pegafus*.

CABALLIO, or **CABELLIO** (anc. geog.), a town of the Cavares in Gallia Narbonensis, situated on the Druentia. One of the Latin colonies, in the Notitiae called *Civitas Cabellivorum*. Now *Cavaillon* in Provence. See *CAVAILLON*.

CABRERIA, a small island in the Mediterranean, about seven miles to the S. of Majorca. It has a large harbour, defended by a castle.

CABUL, the capital of the province of Cabul, and of the dominions of the king of Candahar, situated near the foot of the Indian Caucasus, not far from the source of the Attock, which runs near it. Its situation is spoken of by the Indian historians in terms of rapture; it being no less romantic than pleasant; and having within its reach, the fruits and other products both of the temperate and torrid zone. It is considered as the gate of India toward Tartary, as Candahar is with respect to Persia. It is 680 miles N. W. of Delhi. Long. 68. 58. E. Lat. 34. 36. N.

CACACA, a town of Africa, in the kingdom of Fez, near Malilla. The moors retook it from the Spaniards in 1534; and it has a fort upon a rock. Long. 2. 55. W. Lat. 35. 2. N.

CACERES-DE-CAMARINHA, a town of Asia, in the file of Luconia, with a bishop's see, subject to Spain. Long. 124. 0. E. Lat. 14. 35. N.

CACONGO, a small kingdom of Africa, on the river Zaïre, whose inhabitants are great traders. Their manners, religion, and government, are the same as in Loango. It lies in Lat. 5. 0. S.

CACORLA, a town of Spain, in Andalusia, on the rivulet Vega, between two mountains. It belongs to the Archbishop of Toledo, and is fifteen miles E. S. E. of Ubeda. Long. 2. 55. E. Lat. 37. 40. N.

CADURCI, **CADURCUM**, *Cadurcus*, and *Cadurx* (anc. geog.), a town of the Cadurci, a people of Aquitania; situated between the rivers Oldus running from the north, and the Tarnis from the south, and falling into the Garumna: now *Cahors*, capital of the territory of the Querci, in Guienne. A part of the Caduci, to the south next the Tarnis, were called *Eleutheri*.

CADURCI (anc. geog.), a people of Media Atropatene, situated to the west in the mountains, and reaching to the Caspian sea; between whom and the Medes perpetual war and enmity continued down to the time of Cyrus.

CÆRE (anc. geog.), a town of Etruria, the royal residence of Mezentius. Its ancient name was *Argyllæ*. In Strabo's time not the least vestige of it remained, except the baths called *cæretana*. From this town the Roman censor's tables were called *cæretis tabulae*. In these were entered the names of such as for some misdemeanor forfeited their right of suffrage, or were degraded from a higher to a less honourable tribe. For the people of Cære hospitably receiving those Romans who, after the taking of Rome by the Gauls, fled with their gods and the sacred fire of Vesta, were, on the

C A L

Romans recovering themselves from this disaster, honoured with the privilege of the city, but without a right of voting.

CAERWENT, a village of Monmouthshire, famous for a beautiful mosaic pavement, discovered in 1777; and asserted to be superior to any such discovered on this side of the Alps, and equal to those preserved by the king of Naples at Portici.

CÆSAR Augusta, or *Cæsarea Augusta* (anc. geog.), a Roman colony situated on the river Iberus in the hither Spain, before called *Salduba*, in the territories of the Edetani. Now commonly thought to be *Saragosa*. See that article.

CÆSARODUNUM (anc. geog.), a town of the Turones in Celtic Gaul: now *Tours*, the capital of Touraine. See *TOURS*.

CÆSAROMAGUS (anc. geog.), a town of the Trinobantes in Britain; by some supposed to be *Chelmsford*, by others *Brentford*, and by others *Burset*.

CÆSENA (anc. geog.), a town of Gallia Cispadana, situated on the rivers Iapis and Rubicon: now *Cæsa*, which see.

CÆSIA SYLVA (anc. geog.), a wood in Germany, part of the great Sylva Hercynia, situated partly in the duchy of Cleves, and partly in Westphalia between Wesel and Kessel.

CÆTOBRIX (anc. geog.), a town of Lusitania, near the mouth of the Tagus on the east side; now extinct. It had its name from its fishery; and there are still extant fish-ponds on the shore, done with plaster-of-Paris, which illustrate the name of the ruined city.

CAIETA (anc. geog.), a port and town of Latium, so called from Æneas's nurse; now *Gaeta*, which see.

CAIN, eldest son of Adam and Eve, killed his brother Abel; for which he was condemned by God to banishment and a vagabond state of life. Cain retired to the land of Nod, on the east of Eden; and built a city, to which he gave the name of his son Enoch.

CAIRNGORM, a mountain of Scotland, in the east of Invernesshire; the lofty top of which is patched with snow. It is famous for its beautiful rock-crystals of various tints. They are much esteemed by lapidaries; and some of them, having the lustre of fine gems, bring a high price.

CALAGORINA, or **CALAGURIS**, distinguished by the surname *Nafica* (anc. geog.), a city of the Vascones in the hither Spain: now *Calahorra*.

CALAMATA (*Encycl.*). Erroneously spelt *CALAMATA*. **CALAMIANES**, three small islands of Asia, between Borneo and the Philippines, and N. of Parago. They are famous for their edible bird-nests. Long. 118. 5. E. Lat. 11. 0. N.

CALAURIA (anc. geog.), an island of Greece in the Saronic bay, overagainst the port of Troezen, at the distance of forty stadia. It was thirty stadia in compass, and had a temple of Neptune held in great veneration. It was also an asylum, and the place of the convention or assembly of the seven cities of the Amphictyons. To this place Demosthenes went twice into banishment.

CALBEN, a town of Germany, in the Old Marche of Brandenburg, with a good castle, thirty-two miles N. of Magdeburg.

CALES (anc. geog.), a municipal city of some note in

Campania, at no great distance from Casilinum. The epithet *Caleans* is by Horace and Juvenal applied to a generous wine which the territory produced.

CALETES (anc. geog.), a people of Gallia Celtica, on the confines of Belgica, situated between the sea and the Sequana. Now called *le Pays de Caux*, in Normandy.

CALLE (anc. geog.), a town of Hither Spain, situated on an eminence which hangs over the river Durus; whose port was at the mouth of the river. Now *Porto, Oporto*, or *Port a Port*. See **Oporto**.

CALLIRHŒ (anc. geog.), surnamed *Emecacrunos*, from its nine springs or channels; a fountain not far from Athens, greatly adorned by Pifistratus, where there were several wells, but this only the running spring. Callirhoe was also the name of a very fine spring of hot water beyond Jordan near the Dead Sea, into which it empties itself.

CALORIMETER, an instrument or apparatus, invented by the celebrated Lavoisier, for measuring the escape of heat. See **CHEMISTRY**, pages 376 and 480.

CALVADOS, a department of France, including part of the late province of Normandy. It is so called from a rock of the same name. Caen is the capital city.

CALVARY MOUNT, a hill near Jerusalem, on which **JESUS CHRIST** was crucified.

CALYDON (anc. geog.), a town of Ætolia, situated seven miles and a half from the sea, and divided by the river Evenus; the country was anciently called *Æolis*, from the Æolians its inhabitants. This country was famous for the story of Meleager and the Calydonian boar.

CAM, or GRANTA, a river which rises in Hertfordshire, runs N.E. by Cambridge, and N. to the Isle of Ely, where it falls into the Ouse.

CAMARAT, a sea-port of France, in the department of Finistère and late province of Brittany. In an expedition against Brest in 1694, the English landed here, and lost a great number of men. It stands on a bay of the same name.

CAMBERWELL, a fine village of Surrey, two miles S.E.E. of London. Its parish includes the villages of Dulwich and Peckham.

CAMPBELL (Archibald), earl and marquis of Argyle, was the son of Archibald earl of Argyle, by the Lady Anne Douglas, daughter of William earl of Morton. He was born in the year 1598; and educated in the profession of the Protestant religion, according to the strictest rules of the church of Scotland, as it was established immediately after the reformation. During the commonwealth he was induced to submit to its authority. Upon the restoration, he was tried for his compliance; a crime common to him with the whole nation, and such a one as the most loyal and affectionate subject might frequently by violence be induced to commit. To make this compliance appear the more voluntary and hearty, there were produced in court, letters which he had wrote to Albemarle, while that general governed Scotland, and which contained expressions of the most cordial attachment to the established government. But, besides the general indignation excited by Albemarle's discovery of this private correspondence, men thought, that even the highest demonstrations of affection might, during jealous times, be exacted as a necessary mark of compliance from a person of such distinction as Argyle; and could not, by any equitable construction, imply the crime of treason. The parliament, however, scrupled not to pass sentence upon him, and he suffered with great constancy and courage.

CAMPBELL (Archibald), earl of Argyle, son to the former, had from his youth distinguished himself by his loyalty, and his attachment to the royal family. Though his father was head of the covenanters, he himself refused to concur in any of

their measures; and when a commission of colonel was given him by the convention of states, he forbore to act upon it till it should be ratified by the king. By his respectful behaviour, as well as by his services, he made himself acceptable to Charles when that prince was in Scotland; and even after the battle of Worcester, all the misfortunes which attended the royal cause could not engage him to desert it. Under Middleton he obstinately persevered to harass and infect the victorious English; and it was not till he received orders from that general, that he would submit to accept of a capitulation. Such jealousy of his loyal attachments was entertained by the commonwealth and protector, that a pretence was soon after fallen upon to commit him to prison; and his confinement was rigorously continued till the restoration. The king, sensible of his services, had remitted to him his father's forfeiture, and created him Earl of Argyle; and when a most unjust sentence was passed upon him by the Scots parliament, Charles had anew remitted it. In the subsequent part of this reign Argyle behaved himself dutifully; and though he seemed not disposed to go all lengths with the court, he always appeared, even in his opposition, a man of mild dispositions and peaceable deportment.

A parliament was summoned at Edinburgh in the summer of 1681, and the duke was appointed commissioner. Besides granting money to the king, and voting the indefeasible right of succession, this parliament enacted a test, which all persons possessed of offices, civil, military, or ecclesiastical, were bound to take. In this test the king's supremacy was asserted, the covenant renounced, passive obedience assented to, and all obligations disclaimed of endeavouring any alteration in civil or ecclesiastical establishments. This was the state of the test as proposed by the courtiers; but the country party proposed also a clause of adherence to the Protestant religion, which could not with decency be rejected. The whole was of an enormous length, considered as an oath; and, what was worse, a confession of faith was there ratified which had been imposed a little after the reformation, and which contained many articles altogether forged by the parliament and nation. Among others, the doctrine of resistance was inculcated; so that the test being voted in a hurry, was found on examination to be a medley of absurdity and contradiction. Though the courtiers could not reject the clause of adhering to the Protestant religion, they proposed, as a requisite mark of respect, that all princes of the blood should be exempted from taking that oath. This exception was zealously opposed by Argyle; who observed that the sole danger to be dreaded for the Protestant religion must proceed from the perversion of the royal family. By insisting on such topics, he drew on himself the secret indignation of the Duke of York, of which he soon felt the fatal consequences.

When Argyle took the test as a privy-counsellor, he subjoined, in the duke's presence, an explanation which he had beforehand communicated to that prince, and which he believed to have been approved by him. It was in these words: "I have considered the test, and am very desirous of giving obedience as far as I can. I am confident that the parliament never intended to impose contradictory oaths: therefore, I think no man can explain it but for himself. Accordingly I take it as far as it is consistent with itself and the Protestant religion. And I do declare that I mean not to bind myself, in my station, and in a lawful way, from wishing and endeavouring any alteration, which I think to the advantage of church or state, and not repugnant to the Protestant religion and my loyalty: and this I understand as a part of my oath." The duke, as was natural, heard it with great tranquillity: no one took the least offence: Argyle was admitted to sit that

day in council : and it was impossible to imagine that a capital offence had been committed where occasion seemed not to have been given so much as for a frown or reprimand.

Argyle was much surprised a few days after, to find that a warrant was issued for committing him to prison ; that he was indicted for high-treason, leasing-making, and perjury ; and that from the innocent words above mentioned an accusation was extracted, by which he was to forfeit life, honours, and fortune. It is needless to enter into particulars, where the iniquity of the whole is so evidently apparent. Though the sword of justice was displayed, even her semblance was not put on ; and the forms of law were preferred to sanctify, or rather aggravate, the oppression. Of five judges, three did not scruple to find the guilt of treason and leasing-making to be incurred by the prisoner : a jury of fifteen noblemen gave verdict against him ; and the king being consulted, ordered the sentence to be pronounced, but the execution of it to be suspended till further orders. Argyle, however, saw no reason to trust to the justice or mercy of such enemies : he made his escape from prison, and, till he could find a ship for Holland, he concealed himself during some time in London. The king heard of his lurking place, but would not suffer him to be arrested. All the parts, however, of his sentence, so far as the government in Scotland had power, were rigorously executed ; his estate confiscated, his arms reversed and torn. Having got over to Holland, he remained there during the remaining part of the reign of Charles II. But thinking himself at liberty, before the coronation of James II. to exert himself in order to recover the constitution by force of arms, he concerted measures with the Duke of Monmouth, and went into Scotland to assemble his friends : but not meeting with the success he expected, he was taken prisoner ; and being carried to Edinburgh, was beheaded upon his former unjust sentence, June 30, 1685. He shewed great constancy and courage under his misfortunes : on the day of his death he ate his dinner very cheerfully ; and, according to his custom, slept after it a quarter of an hour or more, very soundly. At the place of execution he made a short, grave, and religious speech ; and, after solemnly declaring that he forgave all his enemies, submitted to death with great firmness.

CAMPBELL (John), duke of Argyle and Greenwich, grandson of the former, was born on the 10th of October, 1680 ; and, on the very day when his grandfather suffered at Edinburgh, fell out of a window three pair of stairs high, without receiving any hurt. At the age of fifteen, he had made a considerable progress in classical learning. His father then perceived and encouraged his military disposition, and introduced him to King William, who, in the year 1694, gave him the command of a regiment. In this situation he remained till the death of his father, in 1703 ; when becoming Duke of Argyle, he was soon after sworn of Queen Anne's privy-council, made captain of the Scotch horse-guards, and appointed one of the extraordinary lords of session. In 1704, her majesty reviving the Scottish order of the Thistle, his grace was installed one of the knights of that order, and was soon after appointed high-commissioner to the Scotch parliament ; where, being of great service in promoting the intended union, he was on his return created a peer of England, by the titles of Baron of Chatham and Earl of Greenwich, and in 1710 was made knight of the Garter. His grace first distinguished himself in his military capacity at the battle of Oudenard ; where he commanded as brigadier-general, with all the bravery of youth, and the conduct of a veteran officer. He was present under the Duke of Marlborough at the siege of Ghent, and took possession of the town. He had also a considerable share in the victory

obtained over the French at the battle of Malplaquet, by dislodging them from the wood of Sart, and gaining a post of great consequence. In this sharp engagement, several musket-balls passed through the duke's clothes, hat, and periwig. Soon after this hot action, he was sent to take the command in Spain ; and after the reduction of Port Mahon, he returned to England. His grace having now a seat in the House of Lords, he censured the measures of the ministry with such freedom, that all his places were disposed of to other noblemen : but at the accession of George I. he recovered his influence. At the breaking out of the rebellion in 1715, he was made commander-in-chief of his majesty's forces in North Britain ; and was the principal means and cause of the total extinction ; at that time, of the rebellion in Scotland, without much bloodshed. In direct opposition to him, or that part of the army he commanded, at the head of all his Campbells was placed Campbell earl of Braidalbin, of the same family and kindred, by some fatal error, that ever misguided and milled that unhappy family of the Stuarts and all its adherents. The consequence was, that both sets of Campbells, from family affection, refused to strike a stroke, and retired out of the battle. He arrived at London, March 6th, 1716, and was in high favour : but, to the surprise of people of all ranks, he was in a few months divested of all his employments ; and from this period, to the year 1718, he signalized himself in a civil capacity, by his uncorrupted patriotism and manly eloquence. In the beginning of the year 1719 he was again admitted into favour, appointed lord-treasurer of the household, and in April following was created Duke of Greenwich. He continued in the administration during all the remaining part of that reign ; and, after his late majesty's accession, till April 1740 ; when he delivered a speech with such warmth, that, the ministry being highly offended, he was again dismissed from his employments. To these, however, on the change of the ministry, he was soon restored ; but not approving of the measures of the new ministry more than those of the old, he gave up all his posts for the last time, and never after engaged in affairs of state. He now enjoyed privacy and retirement ; and died of a paralytic disorder, on the 4th of October, 1743. To the memory of his grace a very noble monument was erected in Westminster-abbey, executed by the ingenious Rubiliac.

The Duke of Argyle, though never first minister, was a very able statesman and politician, most steadily fixed on those principles he believed to be right, and not to be shaken or changed. His delicacy and honour were so great, that it hurt him to be even suspected ; witness that application said to be made to him by one of the adherents of the Stuart family before the last rebellion in order to gain his interest, which was considerable both in Scotland and England. He immediately sent the letter to the secretary of state ; and it vexed him much even to have an application made to him, lest any person should think him capable of acting a double part. When he thought measures wrong or corrupt, he cared not who was the author, however great or powerful he might be ; witness his boldly attacking the great Duke of Marlborough in the House of Lords, about his forage and army contracts in Flanders, in the very zenith of his power and popularity, though in all other respects he was the most able general of his time. The Duke of Argyle, on all occasions, spoke well, with a firm, manly, and noble eloquence ; and seems to deserve the character given of him by Pope :

Argyle, the state's whole thunder born to wield,

And shake alike the senate and the field.

CAMPI (Bernardine) of Cremona, an Italian painter, author of an admired treatise on the art, flourished in the 12th century.

CAMPSEY HILLS, a ridge of hills in Stirlingshire, which extend from E. to W. and occupy the centre of the county.

CANAL (*Encycl.*). The following is the specification of a patent granted to Mr. Huddleston, of Shaftesbury, for a method of conveying boats or barges from a higher level to a lower, and *vice versa*, on canals, by the immersion of a plunger or plungers. "I assume and propose," says the inventor, "that in order to put in practice such my method of conveying boats or barges from a higher level to a lower, and *vice versa*, on canals, by the immersion of a plunger or plungers, there shall be or be supposed a lock (constructed of the usual and proper materials, with which locks on canals are usually or may be conveniently made to contain water), of a proper form and dimension, placed in a line between, and connecting together, the upper and lower parts of a canal and navigation, and furnished at each end with a gate or sluice, sufficiently wide to allow, when opened, the passage of the boat or vessel about to be conveyed; such gates or sluices to be adapted in their respective depths, the one to the upper, the other to the lower level of the canal or navigation; the upper part or coping of such lock must be made of a height sufficient to contain the water of the upper line, and the bottom of such lock must be of a depth to correspond with that of the lower line of navigation. The horizontal superficies or form of the boat or barge intended to be conveyed, ought to correspond with that of the lock, with the allowance of sufficient space for the free rise and fall of the vessel, within the sides and bounds of the lock, the depth of such boat being necessarily regulated by that of the navigation.

"I next propose that there be a reservoir building or excavation made (and prepared with stone, brick, wood, or any other proper material capable of containing water), the upper part or coping of which should be level with that of the said lock; and that the area of the said reservoir should be equal to (or rather in practice somewhat exceeding) the area of the said lock. In this case the perpendicular depth of the reservoir should be equal to double the intended rise or fall of the vessel within the lock; but where the areas of the lock and reservoir are unequal, this proportion varies: for as in all cases the quantity of water to be displaced out of the reservoir into the lock, must be equal in cubical content to that of the space in the said lock between the surface of the lower line and that of the upper, it follows; that if the area of the reservoir be greater than that of the lock, the necessary depth of the water to be displaced will be so much the less than in the case before stated: and, *e contra*, if the area of the reservoir be less than that of the lock, the necessary depth of water to be displaced will be so much the greater: so that whether this proportional quantity of water shall be obtained by the greater depth or the greater area of the reservoir, is a point for the consideration of the artist. A communication sufficient for the free passage of water at or near the bottoms, or in the lower parts of such lock and reservoir, is in all cases essentially necessary. The distance between the said lock and reservoir or reservoirs (where more than one) is discretionary, provided there be such level and communication: the shape of the reservoir is also discretionary, though for the better adaptation of the plunger or plungers, hereafter to be described, I regard an angular form as the most convenient; and to obviate the possibility of damage or obstruction to the free motion of the plunger, by the falling of stones or other substances, between the sides of the reservoir and plunger, it may be practically expedient to give to the plunger or plungers a shape somewhat diminishing downwards, in the nature of a reversed pyramid, in order to enable them on ascending to clear themselves from the obstructing substance.

"Assuming the said lock and reservoir to be formed to

communicate as aforesaid, and to be supplied with water from the lower line, whence of course it would follow, that whatever may be the depth of the reservoir, the water contained in it, and the water in the lock, and of such lower line, would have one common level: supposing a vessel floated into such lock, the lower gate or sluice shut, and that some solid body or bodies, equal or nearly so in cubical content to that of the reservoir itself, be plunged downwards (whether falling by superior specific gravity to that of water, or forced by mechanical means) to the lower part or bottom of such reservoir, it is obvious that the water (if not at least nearly all) in such reservoir would be displaced, and by passing into the lock would, in addition to the water therein-before contained, fill or nearly fill the said lock; and the small quantity of water remaining in the said reservoir would surround the immersed body or bodies up to a level with the water in the lock; and if such solid body or bodies were withdrawn from such reservoir, then the water in the lock would subside to its original level, reoccupying the space in the reservoir, lately held by the body or bodies now raised and before immersed, which I call a plunger or plungers.

"My said invention therefore consists in the practical application of the two following laws of Hydrostatics, for the purposes of conveying boats or barges from a higher level to a lower, and *vice versa*. 1st, That two columns of water, however different in lateral dimensions, will, if there be a communication between them, always maintain one and the same level: and 2^{dly}, That the immersion of any solid body in water will displace a portion of the fluid, equal in quantity to the bulk or solid contents of the body immersed.—And to obviate any objection respecting the above application of the term *solid*, I beg to be understood as using it hypothetically only; being well aware, that in order to produce the proposed effect by immersion, it is not necessary that the body immersed should be a solid one.

"Therefore I apply to the reservoir above predicated (and to more reservoirs than one where necessary, and in any position relative to the lock, so as the lock and reservoirs have such levels, capacities, convenient forms, and communications, as above described) one or more plunger or plungers, fitted to and nearly filling such reservoir or reservoirs, and freely moving up and down therein (but not water-tight, or acting as pistons or forcers in the common acceptance of those terms), formed of such materials, be they stone, wood, brick, copper, iron, or any other suitable material or combination of materials, as may be most conveniently applied to and used in such reservoir or reservoirs. The means of raising or depressing such plunger or plungers, whether by levers, balancing-weight, ropes, chains, pulleys, tooth and pinion, wheel, capstan, windlars, winch, crank, screw, animal force, steam, or other engine or engines, or other mechanical or statical contrivances, must according to situations, circumstances, and expediency, be left to the choice of the person or persons applying such plunger or plungers.

"The said invention may also be executed by causing one or more such plunger or plungers, in respect to height and solid content, to descend or rise within the area of a lock capable of containing, with the allowance of free motion up and down, both the proposed boat or vessel, and the proposed plunger or plungers, and of a depth or depths adapted in its several parts to the necessary rise and fall of each of them respectively, such plunger or plungers being understood to be also of such a figure or figures, as to permit the said boat or vessel to ascend and descend freely within the said lock, and along side of such plunger or plungers: but considering, as I do at present, a partition between the plunger and the lock as more eligible, I notice such an application of my said method principally with a view to prevent evasion.

"My present model consists of a lock and boat as already described (having a certain excess in the depth of each of them), a reservoir near to and parallel with such lock, oblong and rectangular, a sub-communication as specified, a single plunger, oblong and rectangular, fitting, and subject to free motion, filling such reservoir, having two large guiding-wheels or pulleys raised by two other corresponding wheels secured upon a windlass or axis, by means of lines representing chains fastened to such windlass-wheels, and passing under and round the said plunger-wheels, the ends of such lines or chains being brought up and fastened to a beam and frame, supported on the space or partition dividing the reservoir and lock; which frame and the upper part of the windlass-wheels have an elevation sufficient to allow of the ascent of the plunger, till raised above the surface-water of the reservoir. The plunger is counter-balanced by a weight suspended by a line, representing a rope or chain, fixed to the extremity of a curved or spiral lever (as I term it, though perhaps not with strict propriety, it being analogous to the fusee of a time-piece), which lever proceeds from the windlass axis; so that whilst the plunger is raising from its lowest depth to its greatest height (*viz.* to the surface of the water), the said curved lever, by removing the balance-weight from the axis of the windlass, in a ratio corresponding with, or counteracting, the increasing weight of the plunger, facilitates and promotes the steady raising of the plunger; and when the plunger is to be depressed, by reversing the action of the windlass, the weight is made to approach the axis of the windlass, and following the curve of the lever, it surrenders its counteracting powers in proportion, or nearly so, to the increase of the action of the displaced water upon the lower surface of the plunger, as depressed into the reservoir.

"Premising that I consider my said method as preferably applicable, where the lifts or descents are small or moderate, yet without suggesting precise limits, which practice only can regulate; premising also, that boats of a moderate size, as recommended by Dr. Anderson and Mr. Fulton, and exceeding rather in depth than in length or breadth, seem best adapted to the mode of conveyance, the conveying of boats or barges is effected by this invention:

"Let us suppose the reservoir to be sixteen feet deep, and by means of the communication with the water in the lock and lower canal to be half full of water; let us suppose the plunger to be raised to its greatest height of suspension, and to be at or above the surface of the water in the reservoir; let a boat or barge be floated through the lower sluice or gate into the lock, the lower sluice or gate being closed, and the upper one remaining so; let the plunger be depressed to the bottom of the reservoir; the water in the reservoir (minus the small quantity encompassing the plunger) is displaced into the lock through the passage of sub-communication, and the surface of the water in the lock is raised as much as the plunger sinks, *viz.* eight feet, which brings the water in the lock on a level with the upper line of navigation. The upper gate or sluice may then be opened, and the boat floated out of the lock into the upper canal or line of navigation. For descending conveyance, the lock gates, plunger, and reservoir, remaining or being put into the present supposed state, let a boat or barge be floated into the lock from the upper canal or line, the upper gate or sluice be closed, and the plunger raised, the water in the lock will fall as the water in the reservoir takes place of the plunger; and when the plunger is wholly raised, the vessel in the lock will have descended as many feet, *viz.* eight; as the plunger has ascended, and the boat or barge being lowered to the water-level, or nearly so, of the lower line of navigation or canal, is ready to proceed along such lower line, on the opening of the lower gate or sluice. The

lock remains in a situation to receive another vessel from the lower line to be raised to the upper line in the course already described. It may be proper to observe, that in all cases it is necessary that the height of the reservoir should be at least equal to that of the lock, and that the plunger or plungers should fill or nearly fill the reservoir or reservoirs.

"This method of conveying boats or barges from line to line, whenever it is expedient to be practised, seems, on a comparison with other contrivances of a late invention, to be attended with the following material advantages.

"1st, The only machinery essentially necessary (the two sluices excepted) is, for the purpose of raising and depressing the plunger or plungers.

"2d, Whilst the machinery in other contrivances above alluded to, is either wholly or in part liable to injury from water, the machinery in this (the two sluices excepted) is wholly exempt from that disadvantage.

"3d, Whilst in the other contrivances, caissons, coffers, &c. require not only the opening of one or more sluices, but also an adjustment of their ends to the mouth of the canal, to prevent the loss of water, before each boat can enter the lock; according to this plan, on the opening of a single sluice, the boat floats at once into the lock without loss of water, and without any such delay or difficulty. When I say without loss of water, it must be understood with this allowance, that if a boat goes down laden, and returns (or another goes up) unladen, the upper level gains a body of water equal to the weight of the cargo; *e contra*, the lower canal gains similarly, if a boat goes down unladen, and returns laden.

"4th, By the application of this method to the common gate-lock, or by forming the lock of this invention for the escape of water from the higher level into the lock, and from the lock into the lower level, the properties and uses of the common gate-lock and of this invention are united, and they may be used either in combination with other contrivances, or independently. So that

"5th, Whenever the water of the upper line is in plenty, sufficient to allow of the transmission of a lockful of water to the lower level, the machinery of this invention may be left at rest, and vessels may pass and repass by the operation of the common lock: whereas in the other inventions alluded to, no boat or vessel can pass or repass without working the machinery, though the water be ever so abundant.

"6th, On the supposition that the lock used in this invention is constructed as the common gate lock for the transmission of water, this further and important advantage arises, *viz.* that should the machinery of the plunger or plungers be at any time disordered, boats may still pass and repass as through the common gate lock; whereas, should any accident embarrass the machinery of the other locks already alluded to, the whole navigation is obstructed."

CANDAULES, the last king of Lydia, of the family of the Heraclides, was so proud of the beauty of his wife, that he had the folly to let Giges, his favourite, see her naked while she was bathing. The queen, enraged at this action, which, according to the opinion of the Lydians, rendered her infamous, persuaded Giges to murder Candaules; after which the married him, about 716 years before the birth of Christ. In him began the race of the Merminades, which lasted till the defeat of Croesus.

CANDLE (*Encycl.*). A patent was lately granted to Mr. Bolts, of Cannon-street, London, for an improved mode of manufacturing candles. The patentee, by means of moulds with spindles of proper shape and dimensions in the centre, casts hollow candles, or tubes of tallow or wax, without wicks. These tubes are of various shapes; round, elliptical, hexagonal. The hollow in the centre of the tube is also of different shapes

and dimensions, sometimes round, for common purposes, sometimes elliptical, to receive a broad flat wick which shall give a greater light. The wicks are put in at pleasure, thicker or thinner at the choice of the person using the candles, who can thus, after having made trial of one candle for a short while, fo proportion the wicks to all the others of the same size in his possession, that they shall burn equally and without waste of tallow or wax by guttering. The wicks also are thus kept perfectly in the centre, without any of those little projecting jags of cotton which frequently waste and disfigure candles.

In some cases, a solid centre of tallow or wax is inserted into the tube above described; a space being left between the centre and the tube for a circular wick, as used in Argand's lamp.

The wicks do not run the whole length of the candles, but are made sometimes by means of a weight, sometimes of a spring or key, to accommodate themselves to the progressive consumption of the tallow or wax, and seldom require to be snuffed.

Thin tubes of wax are also cast, which are filled with a tallow inside, adding economy to neatness. And whether wax or tallow be the substance employed, it is rendered more solid by the application of pressure by means of an air-pump; while yet in a fluid state in the moulds.

The patentee has, moreover, contrived a very ingenious and expeditious mode of manufacturing the wax or tallow tubes, which consists in forcing, by means of an air-pump, a constant stream of the melting substance through a mould open at both ends, from which it falls, in proper candle lengths, into a vessel of water placed beneath to receive them.

CANE, *GAORTA DEL*, accelerated grotto, on the banks of the Lake d'Agnano, seven miles from Puzzoli, in the kingdom of Naples. Here many dogs have been cruelly tortured and suffocated, to shew the effect of a vapour, which rises a foot above the bottom of this little cave, and is destructive of animal life. A dog having his head held in this vapour is convulsed in a few minutes, and soon after falls to the earth motionless. The experiment is repeated for the amusement of every unfeeling person who has half-a-crown in his pocket, and affects a turn for natural philosophy. The fellows who attend at the cave, have always some miserable dogs, with ropes about their necks, ready for this cruel purpose.

CANGERECORA, a large river of the peninsula of Hindostan. It descends from the Gaut Mountains, and flowing south-west to the coast of Malabar, enters the western ocean, four miles to the north of Mount Dilla; previous to which its course is parallel with the sea coast for about eleven miles, being separated only by a spit of sand.

CANAADERAGO, LAKE, a narrow lake of North America, in the state of New York. It is about nine miles long, and lies to the West of Lake Otego. A stream called Oaks Creek, issues from it, and falls into the river Susquehannah, five miles below Otego. The best cheese in the state of New York is made on this creek.

CANNÆ (anc. geogr.), a mean hamlet of Apulia in the Adriatic, at the mouth of the river Aufidus; raised out of obscurity by a most terrible overthrow given the Romans by the Carthaginians under Hannibal. The Roman consuls were C. Terentius Varro, and L. Emilius Paulus. Their army was vastly superior in numbers to the Carthaginians; but the latter were superior in cavalry. Notwithstanding, however, that the Romans were no fewer than 87,000, so great was the fame of Hannibal, that the consuls were divided in their opinion as to the venturing of an engagement. Emilius was for avoiding a battle, and accordingly encamped on the eminences where the cavalry of the enemy could not act; but next day, it be-

ing Varro's turn to command, he advanced into the plain in which Cannæ was situated, and brought the army into such a situation that an engagement became unavoidable. The Romans were then drawn up in the usual manner; the *hastati* in the first line, the *principes* in the second, and the *triarii* in the third. The cavalry were posted on the wings. On the right, the Roman knights flanked the legionaries; on the left, the cavalry of the allies covered their own infantry. The two consuls commanded the two wings, Emilius the right, and Terentius the left; and the two proconsuls Servilius and Atilius the main body. On the other hand, Hannibal, whose army consisted of 40,000 foot, and 10,000 horse, placed his Gaulish and Spanish cavalry in the left wing, to face the Roman knights; and the Numidian horse in his right; over against the cavalry of the allies of Rome. As to his infantry, he divided the African battalions into two bodies; one of which he posted near the Gaulish and Spanish horse, the other near the Numidian. Between these two bodies were placed on one side the Gaulish, on the other the Spanish infantry, drawn up in such a manner as to form an obtuse angle projecting a considerable way beyond the two wings. Behind this line he drew up a second which had no projection. Aldrubal commanded the left wing; Maeheral the right; and Hannibal himself, with his brother Mago, the main body. He had also taken care to post himself in such a manner that the wind *Favurus*, which rises at certain stated times, should blow directly in the faces of the Romans during the fight, and cover them with dust. The onset was begun by the light-armed infantry; the Romans discharging their javelins, and the *baleares* their stones, with pretty equal success; nevertheless, the consul Emilius was wounded. Then the Roman cavalry in the right wing advanced against the Gaulish and Spanish in Hannibal's left. As they were shut in by the river Aufidus on one side, and by their infantry on the other, they did not fight, as usual, by charging and wheeling off, and then returning to the charge; but continued fighting each man against his adversary, till one of them was killed or retired. After they had made prodigious efforts on both sides to overbear each other, they all on a sudden dismounted, and fought on foot with great fury. In this attack the Gauls and Spaniards soon prevailed; put the Romans to the rout; and pursuing them along the river, strewed the ground with their dead bodies, Aldrubal giving no quarter. This action was scarce over, when the infantry on both sides advanced. The Romans first fell upon the Spaniards and Gauls, who, as already observed, formed a kind of triangle projecting beyond the two wings. They gave ground, and, pursuant to Hannibal's directions, sunk into the void space in their rear; by which means they insensibly brought the Romans into the centre of the African infantry, and then the fugitives rallying, attacked them in front, while the Africans charged them in both flanks. The Romans, being by this artful retreat drawn into the snare and surrounded, no longer kept their ranks, but formed several platoons, in order to face every way. Emilius, who was on the right wing, seeing the danger of the main body, at the head of his legionaries, acted the part both of a soldier and general, penetrating into the heart of the enemy's battalions, and cutting great numbers of them in pieces. All the Roman cavalry that were left, attended the brave consul on foot; and, encouraged by his example, fought like men in despair. But, in the mean time, Aldrubal, at the head of a detachment of Gaulish and Spanish infantry brought from the centre, attacked Emilius's legionaries with such fury, that they were forced to give ground and fly: the consul being all covered with wounds, was at last killed by some of the enemy who did not know him. In the main body, the Romans, though invested on all sides, continued to sell their lives dear; fighting in platoons,

and making a great slaughter of the enemy. But being at length overpowered, and disheartened by the death of the two proconsuls Servilius and Attilius who headed them, they dispersed and fled, some to the right, and others to the left, as they could find opportunity; but the Numidian horse cut most of them in pieces: the whole plain was covered with heaps of dead bodies, inasmuch that Hannibal himself, thinking the butchery too terrible, ordered his men to put a stop to it.—There is a great disagreement among authors as to the number of Romans killed and taken at the battle of Cannæ. According to Livy, the republic lost 50,000 men including the auxiliaries. According to Polybius, of 6000 Roman horse, only seventy escaped to Venuſia with Terentius Varro, and 300 of the auxiliary horse. As to the infantry, the writer tells us, that 70,000 of the Roman foot died on the field of battle fighting like brave men; and that 13,000 were made prisoners. According to Dionysius of Halicarnassus, of 6000 horse, only 370 escaped the general slaughter, and of 80,000 foot, 3000 only were left. The most moderate computation makes the number of Romans killed amount to 45,000.

CANNAY, one of the western isles of Scotland, to the south-west of the isle of Skye. In this verdant and fertile island, are vast basaltic columns, which rise above each other to a great height, in many, successive ranges, each separated from the other by a stratum of pebbly concretions, resembling pudding-stone. On the east side of the island, the tops of an immense number of these columns appear at low water, forming a sort of causeway of surprising extent, and of which the surface is smooth and regular, like an ordinary paved street.

CANOGUE, a town of Hindostan Proper, in the province of Agra, seated on the west bank of the Ganges, near its confluence with the Calini. It is said to have been built more than 1000 years before the Christian æra, and to have been the capital of all Hindostan, under the predecessor of Porus, who fought against Alexander, in the year 326 before Christ. In the 6th century, it was said to contain 30,000 shops, in which betel-nut (which the Indians almost universally chew, as some Europeans do tobacco) was sold. It is now reduced to the size of a middling town. It is 127 miles south-east of Agra. Long. 80. 13. E. Lat. 27. 3. N.

CANOPUS, in Pagan mythology (*Encycl.*). It is said, that the Chaldeans, who worshipped fire, carried their fancied deity through other countries to try its power, in order that, if it obtained the victory over the other gods, it might be acknowledged as the true object of worship; and it having easily subdued the gods of wood, stone, brass, silver, and gold, its priests declared, that all gods did it homage. This the priests of Canopus hearing, and finding that the Chaldeans had brought their god to contend with Canopus, they took a large earthen vessel, in which they bored several holes, which they afterwards stopped with wax, and having filled the vessel with water, painted it of several colours, and sitting the head of an idol to it, brought it out, in order to contend with the Chaldean deity. The Chaldeans accordingly kindled their fire all around it; but the heat having melted the wax, the water gushed out through the holes, and extinguished the fire; and thus Canopus conquered the god of the Chaldeans.

CANOPUS, or *Canobus*, according to Strabo, had been Menelaus's pilot, and had a temple erected to him in a town called *Canopus*, near one of the mouths of the Nile. Dionysius mentions it.

Καὶ τὴν τοῦ πλοῦτος Ἀρχαίου οὐ Κανόβη.

There stands Canobus's temple known to fame;

The pilot who from fair Amycla came.

Vossius remarks, on this occasion, the vanity of the Greeks, who, as he conjectures, hearing of an Egyptian deity named

Canopus, took from thence an opportunity of deifying the pilot of Menelaus who bore the same name, and giving out that the Egyptian god Canopus had been a Greek. F. Monfaucou gives several representations of this deity. One, in allusion to the victory above mentioned, throws out water on every side through little holes.

CANSTAT (*Encycl.*), erroneously spelt CONSTAT.

CANTABRIA (anc. geog.), a district of Terraconensis, on the Oceanus Cantabricus or bay of Biscay; now BISCAY. The inhabitants were remarkable for their warlike character. In conjunction with the Asturians, they carried on desperate wars with the Romans; but they were subdued by them, about twenty-five years before Christ. Being impatient, however, of a foreign yoke, they in a few years revolted. Most of their youth had been already taken prisoners by the Romans, and sold for slaves to the neighbouring nations; but having found means to break their chains, they cut the throats of their masters; and returning into their own country, attacked the Roman garrison with incredible fury. Agrippa marched against them with great expedition; but, on his arrival, met with so vigorous a resistance, that his soldiers began to despair of ever being able to reduce them. As the Cantabrians had waged war with the Romans for upwards of 200 years, they were well acquainted with their manner of fighting, no way inferior to them in courage, and were now become desperate; well knowing, that if they were conquered, after having so often attempted to recover their liberty, they must expect the most severe usage, and cruel slavery. Animated with this reflection, they fell upon the Romans with a fury hardly to be expressed, routed them in several engagements, and defended themselves when attacked by the enemy with such intrepidity, that Agrippa afterwards owned, that he had never, either by sea or land, been engaged in a more dangerous enterprise. That brave commander was obliged to use entreaties, menaces, and to brand some of his legionaries with ignominy, before he could bring them to enter the lists with such a formidable enemy. But having at last, with much ado, prevailed upon them to try the chance of an engagement in the open field, he so animated them by his example, that, after a most obstinate dispute, he gained a complete victory, which indeed cost him dear, but put an end to that destructive war. All the Cantabrians fit to bear arms were cut in pieces; their castles and strong holds taken and rased; and their women, children, and old men (none else being left alive), were obliged to abandon the mountainous places, and settle in the plain.

CANTAL, a department of France, including part of the late province of Auvergne. It is so called from a high mountain, near St. Flour and Aurillac, almost always covered with snow. The capital is St. Flour.

CANTIUM (anc. geog.), a promontory of Britain, literally denoting a head-land, giving name to a territory called *Cantium*, now *Kent*. The promontory is now called the *North Foreland*.

CAPNOIDES, in botany, the trivial name of a species of *FUMARIA*.

CAPPADOCIA-MAGNA (*Encycl.*). The first king of Cappadocia we read of in history was Pharnaces, who was preferred to the crown by Cyrus king of Persia, who gave him his sister Atossa in marriage. This is all we find recorded of him, except that he was killed in a war with the Hyrcanians. After him came a succession of eight kings, of whom we know scarce any thing but that they continued faithful to the Persian interest. In the time of Alexander the Great, Cappadocia was governed by Ariarathes II. who, notwithstanding the vast conquests and fame of the Macedonian monarch, continued unshaken in his fidelity to the Persians. Alexander was

prevented by death from invading his dominions; but Perdiccas marching against him with a powerful and well-disciplined army, dispersed his forces, and having taken Ariarathes himself prisoner, crucified him, with all those of the royal blood whom he could get into his power. Diodorus tells us that he was killed in the battle. He is said to have reigned 82 years. His son Ariarathes III. having escaped the general slaughter of the royal family, fled into Armenia, where he lay concealed, till the civil dissensions, which arose among the Macedonians, gave him a fair opportunity of recovering his paternal kingdom. Amyntas, at that time the governor of Cappadocia, opposed him; but being defeated in a pitched battle, the Macedonians were obliged to abandon all the strong holds. Ariarathes, after a long and peaceable reign, left his kingdom to his son Ariarathes II. He applied himself more to the arts of peace than war, in consequence of which Cappadocia flourished greatly during his reign. He was succeeded by his son Ariarathes IV. who proved a very warlike prince, and having overcome Arsaces, founder of the Parthian monarchy, considerably enlarged his dominions.

He was succeeded by Ariarathes V. who marrying the daughter of Antiochus the Great, entered into an alliance with that prince against the Romans; but Antiochus being defeated, the king of Cappadocia was obliged to sue for peace, which he obtained, after having paid 200 talents by way of fine, for taking up arms against the people of Rome. He afterwards assisted the republic with men and money against Perseus king of Macedon, on which account he was by the senate honoured with the title of *the friend and ally of the Roman people*. He left the kingdom in a very flourishing condition to his son Mithridates, who on his accession took the name of Ariarathes VI.

This prince (surnamed *Philopater*, from the filial respect and love he shewed his father from his very infancy) immediately renewed the alliance with Rome. Out of mere goodnature he restored Mithrobuzanes, son to Ladriades king of the Lesser Armenia, to his father's kingdom, though he foresaw that the Armenians would lay hold of that opportunity to join Artaxias, who was then on the point of invading Cappadocia. The differences, however, were settled, before they came to an open rupture, by the Roman legates; and Ariarathes seeing himself delivered from an impending war by the mediation of the republic, presented the senate with a golden crown, and offered his service wherever they thought proper to employ him. The senate in return sent him a staff, and chair of ivory; which were presents usually bestowed on those only whom they looked upon as attached to their interest. Not long before this, Demetrius Soter king of Syria had offered Ariarathes his sister in marriage, the widow of Perseus king of Macedon: but this offer the king of Cappadocia was obliged to decline for fear of offending the Romans; and his so doing was in the highest degree acceptable to the republic, who reckoned him among the chief of her allies. Demetrius, however, being greatly incensed at the slight put upon his sister, set up a pretender to the throne, one Orophernes, a supposititious, or, as others call him, a natural son of the deceased king. The Romans ordered Eumenes king of Pergamus to assist Ariarathes with all his forces: which he did, but to no purpose; for the confederates were overthrown by Demetrius, and Ariarathes was obliged to abandon the kingdom to his rival. This happened about 159 years before Christ, and the usurpers immediately dispatched ambassadors to Rome with a golden crown. The senate declined accepting the present, till they heard his pretensions to the kingdom; and this Orophernes, by suborned witnesses, made appear so plain, that the senate decreed that Ariarathes and he should reign as partners; but next year, Orophernes

was driven out by Attalus brother to Eumenes, and his successor to the kingdom of Pergamus.

Ariarathes being thus restored, immediately demanded of the Priennians 400 talents of gold which Orophernes had deposited with them. They honestly replied, that as they had been entrusted with the money by Orophernes, they could deliver it to none but himself, or such as came in his name. Upon this, the king entered their territories with an army, destroying all with fire and sword. The Priennians, however, still persevered in their integrity; and though their city was besieged by the united forces of Ariarathes and Attalus, not only made an obstinate defence, but found means to restore the sum to Orophernes. At last they applied to the Romans for assistance, who enjoined the two kings to raise the siege, under pain of being declared enemies to the republic. Ariarathes immediately obeyed; and marching his army into Assyria, joined Alexander Epiphanes against Demetrius Soter, by whom he had been formerly driven out of his kingdom. In the very first engagement Demetrius was slain, and his army entirely dispersed, Ariarathes having on that occasion given uncommon proofs of his courage and conduct. Some years after, a war breaking out between the Romans and Aristonici, who claimed the kingdom of Pergamus in right of his father, Ariarathes joined the former, and was slain in the same battle in which P. Crassus, proconsul of Asia, was taken, and the Roman army cut in pieces. He left six sons by his wife Laodice, on whom the Romans bestowed Lycania and Cilicia. But Laodice, fearing lest her children, when they came of age, should take the government out of her hands, poisoned five of them, the youngest only having escaped her cruelty by being conveyed out of the kingdom. The queen herself was soon after put to death by her subjects, who could not bear her cruel and tyrannical government.

Laodice was succeeded by Ariarathes VII. who, soon after his accession, married another Laodice, daughter of Mithridates the Great, hoping to find in that prince a powerful friend to support him against Nicomedes king of Bithynia, who laid claim to part of Cappadocia. But Mithridates, instead of assisting, procured one Gordius to poison his unhappy son-in-law; and, on his death, seized the kingdom, under pretence of maintaining the rights of the Cappadocians against Nicomedes, till the children of Ariarathes were in a condition to govern the kingdom. The Cappadocians at first fancied themselves obliged to their new protector; but, finding him unwilling to resign the kingdom to the lawful heir, they rose up in arms, and, driving out all the garrisons placed by Mithridates, placed on the throne Ariarathes VIII. eldest son of the deceased king.

The new prince found himself immediately engaged in a war with Nicomedes; but, being assisted by Mithridates, not only drove him out of Cappadocia, but stripped him of a great part of his hereditary dominions. On the conclusion of the peace, Mithridates seeking for some pretence to quarrel with Ariarathes, insisted upon his recalling Gordius, who had murdered his father; which being rejected, with abhorrence, a war ensued. Mithridates took the field first, in hopes of over-running Cappadocia before Ariarathes could be in a condition to make head against him; but, contrary to his expectation, he was met on the frontiers by the king of Cappadocia with an army no way inferior to his own. Hereupon he invited Ariarathes to a conference; and, in sight of both armies, stabbed him with a dagger, which he had concealed under his garment. This struck such terror into the Cappadocians, that they immediately dispersed, and gave Mithridates an opportunity of possessing himself of the kingdom without the least opposition. The Cappadocians, however, not able to endure the tyranny of his prefects, soon shook off the yoke;

and recalling the king's brother, who had fled into the province of Asia, proclaimed him king. He was scarce seated on the throne, however, before Mithridates invaded the kingdom at the head of a very numerous army, and having drawn Ariarathes to a battle, defeated his army with great slaughter, and obliged him to abandon the kingdom. The unhappy prince soon after died of grief; and Mithridates bestowed the kingdom on his son, who was then but eight years old, giving him also the name of *Ariarathes*. But Nicomedes Philopater, king of Bithynia, fearing lest Mithridates, having now got possession of the whole kingdom of Cappadocia, should invade his territories, suborned a youth to pass himself for the third son of Ariarathes, and to present to them a petition in order to be restored to his father's kingdom. With him he sent to Rome Laodice, sister of Mithridates, whom he had married after the death of her former husband Ariarathes. Laodice declared before the senate, that she had three sons by Ariarathes, and that the petitioner was one of them; but that she had been obliged to keep him concealed, lest he should undergo the same fate with his brothers. The senate assured him that they would at all events reinstate him in his kingdom. But, in the mean time, Mithridates having notice of these transactions, dispatched Gordius to Rome, to undeceive the senate, and to persuade them that the youth to whom he had resigned the kingdom of Cappadocia was the lawful son of the late king, and grandson to Ariarathes, who had lost his life in the service of the Romans against Aristonicus. This unexpected embassy put the senate upon enquiring more narrowly into the matter, whereby the whole plot was discovered; upon which Mithridates was ordered to resign Cappadocia, and the kingdom was declared free. The Cappadocians, however, in a short time sent ambassadors to Rome, acquainting the senate that they could not live without a king. This greatly surprised the Romans, who had such an aversion to royal authority; but they gave them leave to elect a king of their own nation. As the family of Pharnaces was now extinct, the Cappadocians chose Ariobarzanes; and their choice was approved by the senate, he having, on all occasions, shewn himself a steady friend to the Romans.

Ariobarzanes had scarce taken possession of his kingdom, when he was driven out by Tigranes king of Armenia; who resigned Cappadocia to the son of Mithridates, in pursuance of an alliance previously concluded between the two parties. Ariobarzanes fled to Rome; and, having engaged the senate in his cause, he returned into Asia with Sylla, who was enjoined to restore him to his kingdom. This was easily performed by Sylla, who, with a small body of troops, routed Gordius who came to meet him on the borders of Cappadocia at the head of a numerous army. Sylla, however, had scarce turned his back, when Ariobarzanes was again driven out by Ariarathes, the son of Mithridates, on whom Tigranes had bestowed the kingdom of Cappadocia. This obliged Sylla to return into Asia, where he was attended with his usual success, and Ariobarzanes was again placed on the throne. After the death of Sylla, he was the third time forced by Mithridates to abandon his kingdom; but Pompey, having entirely defeated Mithridates near Mount Stella, restored Ariobarzanes to his throne, and rewarded him for his services during the war, with the provinces of Sophene, Gordiene, and great part of Cilicia. The king, however, being now advanced in years, and desirous of spending the remainder of his life in ease, resigned the crown to his son Ariobarzanes, in preference of Pompey; and never afterwards troubled himself with the affairs of state.

Ariobarzanes II. proved no less faithful to the Romans than his father had been. On the breaking out of the civil war between Cæsar and Pompey, he sided with the latter; but

after the death of Pompey, he was received into favour by Cæsar, who even bestowed upon him great part of Armenia. While Cæsar was engaged in a war with the Egyptians, Pharnaces king of Pontus invaded Cappadocia, and stripped Ariobarzanes of all his dominions; but Cæsar, having defeated Pharnaces, restored the kingdom of Cappadocia, and honoured him with new titles of friendship. After the murder of Cæsar, Ariobarzanes, having refused to join Brutus and Cassius, was by them declared an enemy to the republic, and soon after taken prisoner and put to death. He was succeeded by his brother Ariobarzanes III. who was, by Marc. Anthony, deprived both of his kingdom and life; and in him ended the family of Ariobarzanes.

Archelaus, the grandson of that general of the same name who commanded against Sylla in the Mithridatic war, was, by Marc. Anthony, placed on the throne of Cappadocia, though nowise related either to the family of Pharnaces or Ariobarzanes. His preferment was entirely owing to his mother Glaphyra, a woman of great beauty, but of a loose behaviour, who, in return for her compliance with the desires of Anthony, obtained the kingdom of Cappadocia for her son. In the war between Augustus and Anthony, he joined the latter; but, at the intercession of the Cappadocians, was pardoned by the emperor. He afterwards received from him Armenia the Lesser, and Cilicia Trachea, for having assisted the Romans in clearing the seas of pirates, who greatly infested the coasts of Asia. He contracted a strict friendship with Herod the Great, king of Judæa; and even married his daughter Glaphyra to Alexander, Herod's son. In the reign of Tiberius, Archelaus was summoned to appear before the senate; for he had always been hated by that emperor, because in his retirement at Rhodes he had paid him no sort of respect. This had proceeded from no aversion in him to Tiberius, but from the warning given Archelaus to his friends at Rome. For Caius Cæsar, the presumptive heir to the empire, was then alive, and had been tent to compose the differences of the East, whence the friendship of Tiberius was then looked upon as dangerous. But when he came to the empire, Tiberius, remembering the disrespect shewn him by Archelaus, enticed the latter to Rome by means of letters from Livia, who promised him her son Tiberius's pardon, provided he came in person to implore it. Archelaus obeyed the summons, and hastened to Rome; where he was received by the emperor with great wrath and contempt, and soon after accused as a criminal in the senate. The crimes of which he was accused were mere fictions; but his concern at seeing himself treated as a malefactor was so great, that he died soon after of grief, or, as others say, laid violent hands on himself. He is said to have reigned 50 years.

On the death of Archelaus, the kingdom of Cappadocia was reduced to a Roman province, and governed by those of the equestrian order. It continued subject to the Romans till the invasion of the eastern empire by the Turks, to whom it is now subject, but has no distinguishing modern name. In what was anciently called *Cappadocia*, however, the Turks have four beglerbeglics, called *Sivas*, *Trebizand*, *Maraschi*, and *Cogni*.

The religion of the ancient Cappadocians was much the same with that of the Persians. At Comana there was a rich and stately temple dedicated to Bellona; whose battles the priests and their attendants used to represent on stated days, cutting and wounding each other as if seized with an enthusiastic fury. No less famous and magnificent were the temples of Apollo Catanius, and of Jupiter: the last of which had 3000 sacred servants, or religious votaries. The chief priest was next in rank to that of Comana; and, according,

to Strabo, had a yearly revenue of 15 talents. Diana Persica was worshipped in a city called *Cassaballa*, where women, devoted to the worship of that goddess, were reported to tread barefooted on burning coals, without receiving any hurt. The temples of Diana at Diospolis, and of Ania at Zela, were likewise held in great veneration both by the Cappadocians and Armenians, who flocked to them from all parts. In the latter were tendered all oaths in matters of consequence; and the chief among the priests was no way inferior in dignity, power, and wealth, to any in the kingdom; having a royal attendance, and an unlimited authority over all the inferior servants and officers of the temple. The Romans, who willingly adopted all the superstitious and superstitious rites of the nations they conquered, greatly increased the revenues of this and other temples; conferring the priesthood on such as they thought most fit for carrying on their designs.—We are told that human sacrifices were offered at Comana; and that this barbarous custom was brought by Orestes and his sister Iphigenia from Taurica Scythica, where men and women were immolated to Diana. But this custom, if ever it obtained in Cappadocia, was abolished in the times of the Romans.

CAPSA (anc. geog.), a large and strong town of Numidia, situated amidst vast deserts; waste, uncultivated, and full of serpents, where Jugurtha kept his treasure. In his time it was taken and rased by Marius the Roman general, who put to death all the citizens capable of bearing arms, and sold the rest for slaves. It was, however, afterwards rebuilt by the Romans, and strongly fortified; but, on the decline of their empire, was taken and demolished a second time by Occuba, a famous Arab general. The walls of the citadel are still remaining, and are monuments of the ancient glory and strength of Capsa. They are 24 fathoms in height, and five in thickness, built of large square stones, and have now acquired the solidity and firmness of a rock. The walls of the town were rebuilt by the inhabitants since their first demolition; but were afterwards destroyed by Jacob Almanzar, who sent a governor and troops into the province. In Marmol's time Capsa was very populous, and abounded with stately mosques and other structures of superb and elegant workmanship; but at present it is occupied by a poor and indigent people, fleeced and oppressed by the Tunisian government. In the very centre of the city stands an inclosed fountain, which both supplies the people with drink, and affords them an agreeable bath. The adjacent country is now cultivated; and produces several kinds of fruits; but the climate is unhealthy. The inhabitants are remarkable for their peevishness of temper. Both men and women dress handsomely except their feet, which they cover with coarse shoes of burling workmanship, and made of the rough skins of wild beasts, equally inconvenient and unbecoming. E. Long. 9. 3. N. Lat. 33. 15.

CAPTION, in Scots law, a writ issuing under his majesty's signet, in his majesty's name, obtained at the instance of a creditor in a civil debt, commanding messengers at arms and other officers of the law to apprehend and imprison the person of a debtor until he pay the debt.

CAPUA, a town of the kingdom of Naples, with an archbishop's see. It is two miles from the ancient Capua, and was built out of its ruins. It is the place where Hannibal and his officers trifled away their time in pleasure, during which the Romans recovered from their consternation after the battle of Cannæ. It was taken by the allies in 1707; and is seated on the river Volturno, 15 miles N. of Naples. Long. 14. 19. E. Lat. 41. 7. N.

CAPUA (anc. geog.), a very ancient city of Italy, in Campania, and capital of that district. It is famous for the abode

of Hannibal the Carthaginian general after the battle of Cannæ, and where Livy accuses him, but unjustly, of having enervated himself with pleasure. It still retains the name, and is the see of an archbishop. It is seated on the river Volturno, in E. long. 15. 5. N. lat. 41. 7.

CARACCAS (*Encycl.*). Of this district the coast is rocky and mountainous, interspersed with small fertile valleys; subject at certain seasons of the year to dry north-west winds, but blessed in general with a clear air and wholesome climate. A very great illicit trade is carried on by the English and Dutch with this province, notwithstanding all the vigilance of the Spaniards, who have scouts perpetually employed, and breastworks raised in all the valleys. A vast number of cacao-trees are cultivated in this province; and it is reckoned that the crop of cacao produced here amounts to more than 100,000 fanegas of 110 pounds each. The country of Santa Fé consumes 20,000; Mexico a little more; the Canaries a small cargo; and Europe from 50 to 60,000. The cultivation of the plant employs 10 or 12,000 negroes. Such of them as have obtained their liberty have built a little town called *Nirva*, into which they will not admit any white people. In 1728 a company was formed at St. Sebastian, which obtained an exclusive right of maintaining connections with this part of the new world. Four or five ships, which they dispatch every year, sail from thence, but they return to Cadiz.

CARAITES (*Encycl.*). The Caraites pass for the most learned of the Jewish doctors. They are chiefly to be met with in Poland, Muscovy, and the East; and they are but few in comparison of the bulk of the Jews who are of the party of the rabbins. The latter have so great an aversion to the Caraites, that they will have no alliance or even conversation with them: they treat them as bastards; and would a Caraitite turn rabbinist, the other Jews would not receive him. In our original article this word has been erroneously spelt **CARAITES**.

CARARA, a small town of Italy, in the duchy of Massa, between the towns of Massa and Sarzana, five miles from each. Near this place are quarries of marble of various colours. Long. 9. 55. E. Lat. 44. 5. N.

CARASU, a river of Natolia, which rises in Carmania, crosses part of Aladula, and falls into the Mediterranean. The water of this river is so cold, that when Alexander the Great bathed in it, it threw him into a dangerous disease. The emperor Barbarossa was killed by it on his return from the Holy Land, in 1100.

CARASU-MESTRO, a river of Romania, in Turkey in Europe, which takes its rise in Mount Rodolpho, and falls into the Archipelago.

CARASUI, a lake in Bulgaria, said to be 55 miles in circumference, and to contain several islands. It is formed by a branch of the Danube, not far from its entrance into the Black Sea.

CARAVACCA, or **THE CROSS OF CARAVACCA**, a town in Spain, among the mountains near the Segura, in Murcia. They pretend to have a cross here, brought by an angel to a priest, who was going to say mass to a Moorish king. It is 50 miles N.W. of Carthagea. Long. 2. 5. W. Lat. 38. 5. N.

CARDIGAN-BAY, on the coast of Cardiganhire, at the mouth of the Tywy, extending to Barley island in Carnarvonshire. It is 40 miles from one cape to the other, and affords good shelter for ships.

CARIGNANO, a town of Piedmont, in a district of the same name. It is seated on the river Po, three miles S. of Turin. Long. 7. 45. E. Lat. 44. 57. N.

CARIMAN-JAVA, a cluster of islands to the N. of Java, at the principal of which European ships touch for refresh-

ments in their voyage to Borneo. Long. 110. 12. E. Lat. 5. 56. S.

CARNATIC, *THE*, a country of the peninsula of Hindoostan, extending from the Guntoor Circar, along the whole coast of Coromandel, to Cape Cormorin; including its appendages, which are Tanjore, Maravar, Tritchinopoly, Madura, and Tinevely. It is 570 miles in length from N. to S. but no more than 120, and commonly 75 miles wide. The revenue of the sovereign, who is called Nabob of Arcot, is stated at 1,500,000. per annum, out of which he pays a subsidy of 160,000. to the East-India Company, toward the expence of their military establishment. The British possessions in the Carnatic are confined chiefly to the tract called the Jaghire, which extends 108 miles along the coast, and 47 inland in the widest part; its annual revenue 150,000. There is, besides, a land-revenue of 725,000. dependent on Madras. The Carnatic is a rich, fertile, and populous country, and contains an incredible number of fortresses. Public monuments too, the unequivocal marks of civilization and opulence, are more common here than in the N. parts of India. In 1787 the East-India Company took the whole administration of the Carnatic, and the collection of the nabob's revenues, into their own hands; on which account his highness instituted a suit in the British Court of Chancery against the Company, and likewise presented a petition for redress to the House of Commons.

CAROLINA. (*Encycl.*) This country is seated between extremities of heat and cold, though the heat is more troublesome in summer than the cold in winter; their winters being very short, and the frosty mornings frequently succeeded by warm days. The air is generally serene and clear the greatest part of the year; but in February and March, the inhabitants have a custom of burning the woods, which causes such a smoke as to strangers would seem to proceed from a fog or thickens in the air. The smoke of the tarketins likewise deceives the strangers, and gives them an ill opinion of the air of Carolina; to which also conduces a custom of the Indians of setting fire to the woods in their huntings, for many miles round. The great rains are in winter, though they are not without heavy showers at midsummer; add to these the constant dews that fall in the night, which refresh the ground and supply the plants with moisture. In North Carolina, the north-west winds in the winter occasion very pinching weather: but they are not of long continuance. Westerly winds bring very pleasant weather; but the southerly are hot and unwholesome, occasioning fevers and other disorders. But this must be understood of summer, for in winter they are very comfortable. The depth of winter is towards the latter end of February, and then thence is not strong enough to bear a man's weight. In August and September, there are sometimes great storms and squalls of wind, which are so violent as to make lanes of 100 feet wide, more or less, through the woods, tearing up the trees by the roots. These storms generally happen once in about seven years; and are attended with dreadful thunder, lightning, and heavy rains. They commonly happen about the time of the hurricanes which rage so fatally among the islands between the tropics; and seem to be occasioned by them, or to proceed from the same cause: but by the time they reach Carolina, their force is much abated; and the further north they proceed, so much the more do they decrease in fury. The soil on the coast is sandy; but further up, the country is so fruitful, that they have not yet been at the trouble to manure their land. The grains most cultivated are Indian corn and rice, though any sort will thrive well enough; they have also pulse of several forts, little known in England. All kinds of

garden-stuff usual in England are cultivated here, and may be had in great plenty. They export large quantities yearly of rice, pitch, tar, turpentine, deer-skins, and timber for building; cyprès, cedar, salisfras, oak, walnut, and pine. Besides these they also send out beef, pork, tallow, hides, furs, wheat, peas, potatoes, honey, bees-wax, myrtle-wax, tobacco, snake-root, cotton, several sorts of gums, and medicinal drugs. Indigo is also cultivated in this province, but of an inferior quality to that which comes from the Caribbee islands. It hath been attempted in vain to cultivate vines, and produce silk, in this country; for though the frosts here do not continue long without intervals of warmer weather, they are sufficient to check the growth of the vine, as well as olives, dates, oranges, &c. The furs are bought of the Indians with vermilion, lead, gunpowder, coarse cloth, iron, and spirituous liquors. As yet they have not a sufficient number of handicraftsmen; which renders labour very dear, and a supply of clothes from Europe necessary. The aspect of the country is very fine, being adorned with beautiful rivers and creeks, and the woods with lofty timber, which afford delightful and pleasant seats for the planters, and render the fencing their lands very easy. And as they have plenty of fish, wild-fowl, and venison, besides other necessities which this country produces naturally, they live easy and luxuriously. The planters and their families that are born here, are troubled with few distempers; and are generally tall, well made, and active. The women who are not exposed to the weather are remarkably fair and handsome, with fine eyes. They marry at thirteen or fourteen; and where there is no clergyman, the ceremony is performed by a justice of the peace. They are very fruitful, have easy labours, and the children at nine months old are able to run about the house. Both sexes, as well young as old, are very dextrous in paddling and managing the canoes, being bred to it from their infancy. The religion of the planters is that of the church of England; but, as there is liberty of conscience, here are dissenters of all sorts.—The most substantial people build their houses with brick and lime made with oyster-shells; for there is no stone except near the mountains. The meaner sort make theirs with rough boards, and cover them with shingles. Their diet, except Indian corn, differs little from ours; and they import several sorts of strong liquors. Besides which they have cyder, persimon, and cedar beer, of their own. They have likewise a beer made with molasses, wheat-bran, and hops, which is very good. There are mines of pit-coal in this country; but they have much plenty of wood for firing, that there is no occasion to work them.

Their rivers are large, and navigable a great many miles up the country. They rise near the mountains, and abound with delicate fish, besides water-fowl of different kinds. In some there are islands which yield good pasture, without the annoyance of wild beasts. The chief mountains are the Cherokee or Allegany mountains, which are situated north and north-west, five or six hundred miles distant from the sea. They are very high; and abound with trees, plants, stones, and minerals, of different kinds. The inhabitants chiefly make use of paper money among themselves.

The most common diseases are agues, cachexies, fluxes, the yaws, colics, convulsions, the hooping-cough, tetters, the prickly heat, and the itch.

The Indians, like those in other parts, are well made, of a red copper colour, with black hair, and the whites of their eyes streaked with red. They have no beard, nor hair on any part of the body but the head. Those that are clothed and brought up among the planters, have their skins of a bright reddish colour; but those that go naked are more

dusky, from a custom of daubing themselves with bears' grease. However, by painting themselves with roucou, they appear more red than they naturally would be. They use other colours on different occasions. They generally go quite naked, except a few who have been taught to be a little more modest. They are great smokers, and good marksmen; and will walk on the ridge of a house without fear of danger of falling.

This country is divided into North and South Carolina, and Georgia; each of which is under a particular governor. The North is subdivided into four counties, Granville, Colleton, Berkeley, and Craven; and South Carolina into two, Clarendon and Albemarle. This last is also divided into fourteen parishes or townships, each of which has a brick or timber church. The former likewise has the same number of parishes. Charlestown is the capital of the whole country.

Carolina was discovered by Sebastian Cabot, about the year 1500, in the reign of Henry VII. but the settling of it being neglected by the English, a colony of French Protestants, by the encouragement of Admiral Coligni, were transported thither; and named the place of their first settlement *Arx Carolina*, in honour of their prince, Charles IX. of France: but in a short time that colony was destroyed by the Spaniards; and no other attempt was made by any European power to settle there till the year 1664, when 800 English landed at Cape-Fear in North Carolina, and took possession of the country. In 1670 Charles II. of Britain granted Carolina to the Lords Berkeley, Clarendon, Albemarle, Craven, and Ashley, Sir George Carteret, Sir William Berkeley, and Sir John Colleton. The plan of government for this new colony was drawn up by the famous Mr. Locke, who very wisely proposed an universal toleration in religious matters. The only restriction in this respect was, that every person claiming the protection of that settlement, should, at the age of seventeen, register himself in some particular communion. To civil liberty, however, our philosopher was not so favourable; the code of Carolina gave to the eight proprietors who founded the colony, and to their heirs, not only all the rights of a monarch, but all the powers of a legislation. The court, which was composed of this sovereign body, and called the *Palatine Court*, was invested with the right of nominating to all employments and dignities, and even of conferring nobility; but with new and unprecedented titles. They were, for instance, to create in each county two *cuciques*, each of whom was to be possessed of 24,000 acres of land; and a *landgrave*, who was to be bestowed were to compose the upper house, and their possessions were made unalienable. They had only the right of farming or letting out a third part of them at the most for three lives. The lower house was composed of the deputies from the several counties and towns. The number of this representative body was to be increased as the colony grew more populous. No tenant was to pay more than about a shilling per acre, and even this rent was redeemable. All the inhabitants, however, both slaves and freemen, were under an obligation to take up arms upon the first order from the Palatine court.

It was not long before the defects of this constitution became apparent. The proprietary lords used every endeavour to establish an arbitrary government; and, on the other hand, the colonists exerted themselves with great zeal to avoid servitude. In consequence of this struggle, the whole province, distracted with tumults and dissensions, became incapable of making any progress, though great things had been expected from its particular advantages of situation. Though a toleration in religious matters was a part of the original constitu-

tion, dissensions arose likewise on that account. In 1705, Carteret, now Lord Granville, who, as the oldest of the proprietors, was sole governor of the colony, formed a design of obliging all the non-conformists to embrace the ceremonies of the Church of England; and this act of violence, though disavowed and rejected by the mother-country, inflamed the minds of the people. In 1720, while this animosity was still subsisting, the province was attacked by several bands of savages, driven to despair by a continued course of the most atrocious violence and injustice. These unfortunate wretches were all put to the sword: but, in 1728, the lords proprietors having refused to contribute towards the expenses of an expedition, of which they were to share the immediate benefits, were deprived of their prerogative, except Lord Granville, who still retained his eighth part. The rest received a recompence of about 24,000l. The colony was taken under the immediate protection of the crown, and from that time began to flourish. The division into North and South Carolina now took place; and the settlement of GEORGIA commenced in 1732.

CARPATHIAN MOUNTAINS, mountains which divide Hungary and Transylvania from Poland.

CARSHALTON, a village in Surrey, situated south-west of Croydon. It lies among many springs, which joining others from Croydon and Beddington, form a river, in the very street, called the Wandle.

CARRIAGE (*Encycl.*), a vehicle serving to convey persons, goods, merchandizes, and other things, from one place to another. The following description of an apparatus for preventing passengers in carriages being injured when the horses have taken fright, by Mr. George Davis, of Windsor, is worthy of being noticed, since the Society for the Encouragement of Arts, Manufactures, and Commerce, deemed the inventor worthy of a bounty of thirty guineas. Having given in plate 19. a view of the apparatus as fixed to a coach, we should conceive it will not be necessary to enter into a very particular description of it. We shall therefore only relate the manner of operation in the inventor's words.

"It is fixed behind the splinter-bar," says he, "and the communication, by means of a copper chain, is carried through the boot to the side of the coach-box, that, in case of the horses taking fright, or, of that more fatal accident, the reins breaking, which precludes the possibility of stopping the horses, the coachman can discharge them instantaneously. There is this superiority in my invention over any other method hitherto put in practice, That the horses can be liberated, even when the pole is at right angles, or locked close to the perch, a position which otherwise overturns a carriage. I have had the honour of exhibiting a trial before his majesty, and discharged the horses three times; which Mr. Vidler, of Millbank, can attest, having been present on the spot, and who was pleased to say, that he thought, if it was more generally known, no carriage would be without it.

"Fig. A, is the splinter-bar of a carriage, to which the horses are attached by the traces fixed to the rollers B, B, B, B, and to the pole C.

"D D D, a brass chain, extending from the coach-box to the splinter-bar: this chain goes under the roller E, is then wound once round the pulley G, and thence directed, by the small rollers H and I to the quadrant K, to the farthest extremity of which it is attached.

"The quadrant K has a vertical axis, on the upper part of which is a pinion with four teeth (see L, figs. 2 and 3). This pinion works in two racks, M, M, fixed on two elbow-head bolts N, N; and by means of these racks, the bolts are moved backwards and forwards by the action of the quadrant K.

These bolt-bars extend from the centre of the splinter-bar

to its extremity, the straight end of the bolts shooting into the rollers B, B, fig. 1, at the end of the splinter-bar, and the elbow-heads, *n, n*, shooting into the two centre-rollers B, B.

"On the lower part of the axis of the quadrant K is a female screw, which receives a bolt O (see fig. 3), one end of which, when bolted, passes through the bolt C: the other end of it is a small screw.

"P, Q, are two collars fixed on the splinter-bar, which collars confine the axis, and prevent its being displaced.

"Fig. 4, shews the pulley G, round which the chain D passes: the axis of this pulley contains two female screws, R, S, with threads in different directions moving the two bars, T, V, backwards or forwards, so as to protrude them on the conical part of the naves of the fore wheels of the carriage, and to act as a brace thereon, so as to retard their motion.

"Fig. 5, is a link of the chain, in order to shew its make or formation.

"When the horses are to be detached, and the carriage stopped, the coachman, sitting on the coach-box, draws up a handle W, fig. 1, affixed to the chain D by means of an iron bolt with a spring upon it, to retain it when drawn out: the chain D pulls back the quadrant K, and draws back the double bolts N, N, which pass through square holes at the lower end of the rollers B. The same motion of the quadrant, by means of its female screw, raises the screw-bolt O, and sets the pole at liberty; so that the horses move off with the pole and rollers. It has been before observed, that the chain D winds once round the pulley G; by this means, when the chain is drawing up to detach the horses, the motion of the pulley propels, from its female screw on each side, bolts which have screw-heads at one end, and wedges at the other, which wedges, when propelled, act as braces on the conical-formed naves of the fore-wheels, and stop the motion of the fore-wheels.

"X is a square head on the axis of the quadrant K: by means of a key applied on this head, when necessary to attach the horses to the carriage, the quadrant is returned to its place, and bolts the rollers and pole, after they are replaced in their proper situations: the quadrant at the same time pulls back the chain on the pulley G, which pulley draws back the wedge-bolts from the conical naves of the fore-wheels, and sets them free to move.

"The Committee of Mechanics, to whose consideration this business was referred by the Society, appointed a trial to be made near the Magazine in Hyde Park, on Thursday, the 27th of March, 1800, with a coach, to which the apparatus was attached. Four horses and two postillions were employed for the purpose. A person sitting on the coach-box loosed the pole and rollers from the carriage, by pulling a chain placed near the boot, which chain drew back the bolts in the splinter-bar, and allowed the pole and rollers to be carried off by the horses, at a time when they were galloping at the rate of more than ten miles an hour. The experiment was repeated thrice, and the horses disengaged each time; but the impetus given to the carriage by the velocity of the horses, occasioning the coach to run forwards above twenty yards on level ground, after the horses were detached, the committee were of opinion, that a part, but not the whole of the object of the society was answered, as the passengers in the carriage might yet suffer injury from the motion of the carriage after the horses were liberated. On their noticing this circumstance to Mr. Davis, and a gripe being added to stop the motion of the wheels, Mr. Davis, on the 8th of May last, produced the present ingenious invention to the committee; by means of which, at one pull of the chain, the horses may be liberated, and two bolts propelled on the nave of the fore-wheels, so as to retard their motion."

The following is the specification of the patent granted to Mr. Reddel, of Birmingham, for a new method of constructing carriages for the conveyance of merchandize either by land or water; which carriages may be removed (either loaded or unloaded) from the land to the water, or from the water to the land, with ease, expedition, and safety.

"I make the bodies of the carriages," says Mr. Reddel, "to any form or size required, chiefly of wood, and strengthen or fasten the parts together with iron, or any other suitable substance, and make the bottoms, ends, and sides of them as water-tight as possible. I then fix a suitable number of wheels thereto, by means of an axletree, or axletrees, or in any other eligible manner (but in most cases it will be best to place them so that the bottom of the carriage or carriages may not be more than six, or less than three or four inches above the level surface of the ground). I sometimes place the wheels, in suitable recesses, in the sides of the boat-parts, or bodies, of the carriages, and put either a broad plank, or some strong iron work, over their centres, in order to support and protect them; or they may be fixed in narrow water-tight compartments, or boxes, in suitable places in the inside of the boat-part, or body, of the carriage, but of course the number of the wheels, and the manner of fixing them, must be varied according to circumstances. When they are in the water, a considerable number of the small-sized carriages may be fastened together, in any eligible manner, and hauled by one horse; and if they are wanted out of the water they must be separated, and drawn up an inclined plane by one or more at a time. They may then be taken up, or let down, a plane to a higher or lower level of water, as circumstances may require, or be drawn by land (either loaded or unloaded) to any place wherever they may be wanted, very near, if not quite, as readily as a common waggon or cart. Carriages of this description may be made to carry any reasonable burden, that is to say, from one ton to twenty tons and upwards, according to the uses for which they are intended; such as are meant to be drawn about when on the land by two or three horses would be best, if calculated to carry about two or three tons. They may be made principally with square ends, and may be either linked, tied, or grappled, to each other when they are in the water, or a rope or ropes, chain or chains, may pass through either rings, loops, or holes, made in, or attached to, each of them: and by means of a lever, weight, or spring, in one or both of the end carriages, they may be braced together sufficiently tight. The foremost end of the body of the leading carriage, if it is deemed necessary, may be made in the usual cut-water form, and the hindmost may have a rudder attached to it, which may be taken off, or put on, at pleasure, and they all may be steered together as one boat. In canals, where the water is on different levels, if a sufficient quantity cannot conveniently be spared from the upper level for the supply of locks, it will be extremely eligible to have carriages of the aforesaid description to carry about six or eight tons each, and when three of them are fastened together in the water, they will be equal in size and appearance to a common canal coal-boat, and to pass them from one level to another it would be necessary to have an inclined plane or planes to go down into the water at the head of the upper level, and another from thence down into the water of the lower level, and of course a certain degree of power would likewise be necessary to let down, and draw up, the carriages on the inclined planes. A small steam-engine, somewhat like those which are used at several of the collieries in the kingdom, to draw the coals out of the pits, if well executed, would pass upwards of two hundred tons over the planes in an hour, if the difference in the levels was not more than twenty or thirty feet; and the expense of making the planes, and erecting the engine, would not be much more, if so much, as making four common

locks, with the necessary appendages; or any other power might be made use of that was thought more eligible. If still greater dispatch is required, the machinery may be made a little stronger, and carriages of nine or ten tons burden or more may easily be taken over the planes, and then may be constructed that when two of them are fastened together in the water, they would form but one complete boat in size and appearance, of course they may pals the locks together as one boat, if there are any locks on the line of the canal where these boat-carriages may be used, or pals the planes separately, with expedition and safety."

The following duties have been laid by parliament on carriages kept for pleasure.

By the stat. 38 Geo. III. c. 41. there shall be paid from and after April 5. 1798, in lieu of the old duties repealed by this act, the following duties for every carriage herein-after mentioned:

	£.	s.	d.
For one such carriage with four wheels and no more	9	12	0
For two such carriages with ditto	10	4	0
For three with ditto	11	4	0
For four with ditto	11	8	0
For five with ditto	11	11	0
For six with ditto	11	12	0
For seven with ditto	11	13	6
And for eight such carriages with four wheels and upwards	11	14	0

The said duties to be charged for every carriage with four wheels, or any number thereof, kept by any person for his own use, or to let out for hire.

And there shall be paid for every such carriage with four wheels let to hire for the purpose of travelling post, by any licensed postmaster, or inn-keeper, and whereon the name and abode of the person licensed shall be painted

8 8 0

And for every carriage with less than four wheels

4 4 0

The last duty to be charged on every carriage with less than four wheels, kept by any person for his own use, or to let out to hire, to be paid by the person keeping or using such carriage.

TABLE OF THE DUTY ON CARRIAGES.

Carrriages with 4 Wheels. Carriage with 2 Wheels.

No. of C.	Duty per Carriage			Total Amount			No. of C.	L. s. d.			Total Amount		
	L.	s.	d.	L.	s.	d.		L.	s.	d.	L.	s.	d.
1	9	12	0	9	12	0	1				4	4	0
2	10	4	0	20	8	0	2				8	8	0
3	11	4	0	33	12	0	3				12	12	0

5	11	11	0	57	15	0	5				21	0	0
6	11	12	0	69	12	0	6				25	4	0
7	11	13	6	81	14	6	7				29	8	0
8	11	14	0	93	12	0	8				33	12	0
9				105	6	0	9				37	16	0
10				117	0	0	10				42	0	0
11				128	14	0	11				46	4	0
12				140	8	0	12				50	8	0
13				152	2	0	13				54	12	0
14				163	16	0	14				58	16	0
15				175	10	0	15				63	0	0
16				187	4	0	16				67	4	0
17				198	18	0	17				71	8	0
18				200	2	0	18				74	12	0
19				211	16	0	19				79	16	0
20				223	10	0	20				80	0	0

And so on, at the rate of 11l. 14s. for every carriage with four wheels, and 4l. 4s. for every carriage with two wheels.

Note, Carriages with four wheels, let to hire to travel post for a day, or less period of time, or by the mile, or from stage to stage, are chargeable only 8l. 8s. per carriage.

CART (Encycl.). We propose to extend this article, by availing ourselves of the selections of our respectable fellow-labourer the editor of the DOMESTIC ENCYCLOPEDIA.

In rural economy, the proper construction, and adaptation of carts to different soils and situations, are objects of the first consequence to every reflecting farmer. Nevertheless, it is surprising, that little attention has been paid to this important subject, previous to the late improvements in agriculture: the flourishing era of which, in Britain, commenced about the middle of last century, or the year 1754, when that patriotic Society for the Encouragement of Arts, Manufactures, and Commerce, was instituted at London. Since that memorable period, numberless inventions have been introduced into rural economy, and the names of many other illustrious promoters of true national wealth, will be remembered by a grateful posterity. In Mr. Arthur Young's Annals of Agriculture, the 18th volume, we meet with an elaborate paper, entitled *The Farmer's Cart*; by the editor; from which we shall extract the following particulars: Mr. Young first observes, that the most general farmer's carriage in England, is a waggon, drawn by four horses, in which is conveyed corn, hay, wood, &c. but not dung or earth, which are usually moved by carts, or tumbrils, drawn by three or four horses:—carriers almost universally employ broad-wheeled waggons, drawn by eight horses.

In Scotland, waggons were formerly used, but afterwards changed for large carts, and more lately for small ones, drawn by one horse.

In Ireland, the most common vehicle at present is the one-horse cart, with low wheels beneath the body of the machine; which has universally superseded the use of English carts and waggons, from a conviction of their inferiority. Nothing, says Mr. Young, exceeds the amazing expedition with which corn and hay fields are cleared in that country, by means of this useful, though inelegant implement. In consequence of such a decisive encomium, as well as the very favourable account given of this machine by the late Mr. Bakewell, of Dishley, Leicestershire, in the Communications to the Board of Agriculture, we have been induced to present our readers with the following description, of an Improved Irish Car. See Pl. 19.

The advantages of this vehicle, which was preferably employed, and strongly recommended, by the last-mentioned agriculturist, consists in the facility with which it is laden, on account of its lowness; and, when gate-ways and roads are narrow, much room is gained by the wheels being fixed under the body of the cart. In such situations, therefore, it is well calculated for carrying manure, especially on meadow or ploughed land; and for that purpose, its wheels ought to have a flat bearing, and to be at least six inches in breadth. Another peculiarity in the construction of this cart is, that its wheels are necessarily cylindrical; and that the facility of draught arising from this unobserved circumstance, was probably imputed to some other part of the machinery. But, though contrary to the generally-received opinion, Mr. Alexander Cummins (in his Observations on the Effect which Carriage-wheels with Rims of different Shapes have on the Roads, printed in the Communications to the Board of Agriculture), has satisfactorily demonstrated, and it is likewise evinced by experience, that the resistance to the cylindrical wheel is not increased, but diminished, by increasing the breadth and the flat bearing of its rim. The knowledge of this fact is of very great importance to the farmer, as well as to the waggoner;

Lord R. Seymours One Horse Cart

M. Davis's invention for security in Carriages

Improved Irish Car

Wheel Drag

for, by availing himself of this simple improvement, he may be enabled, in almost all seasons, to drive his broad-wheeled carts, &c. on his meadow or ploughed ground, when no narrow wheel can be employed.—Hence, it would be superfluous to enumerate the further advantages of this implement; yet, when the width of gate-ways and the breadths of roads will admit of the wheels being placed at the sides of the cart, without confining the width of its body, it will probably be more advantageous to have them at the sides, than under the cart.

One of the greatest advocates for one-horse carts, is Lord Robert Seymour, whose excellent paper on this subject, dated Talairis, 5th September, 1796 (inserted in the 27th volume of the *Annals of Agriculture*), deserves the thanks of all British farmers. This patriotic nobleman strongly recommends the cart which he employs on these estates, as a most useful implement of husbandry. Convinced of its superior excellence, in many situations, we have thought proper to annex an accurate engraving of this cart, for the elucidation of which, we shall extract the following particulars from his lordship's letter, addressed to the editor of the last-mentioned work:

The advantages of single-horse carts are universally admitted, wherever they have been attentively compared with carriages of any other description. By his own observation, Lord Seymour is led to conclude, that a horse acting singly will do half as much more work as in conjunction with another, so that two horses will, separately, perform the work of three conjunctively. This difference, he believes, arises partly from the single horse being so near the load he draws, and partly from the point or line of draught being so much below his breast; as the wheels, of single-horse carts are usually made very low. When a horse draws in conjunction with another, he is generally embarrassed by some difference of rate—the horse behind, or before him, being quicker or slower than himself: whereas a single horse has only his load to contend with, and is not inconvenienced by the greater or lesser height of his fellow. Nor is there any necessity for employing additional drivers; as horses, once in the habit of going singly, will follow each other as uniformly and readily, as they do when harnessed together: hence, on the most frequented roads in Ireland, one man conducts three, four, or five single-horse carts, without any inconvenience to the passenger.

Dimensions of the body of the cart: two feet eleven inches across the bottom; three feet nine inches, inside length; one foot high; sloping top, nine inches. It has iron wheels; two feet eight inches high; rim, three inches and a half wide, and from three-quarters to an inch thick: spoke, three inches and a quarter at each end, worked off to two inches at its centre. See Pl. 19.

In the introduction to the letter above alluded to, his lordship observes, that the price of iron-cast into wheels is 16s. per cwt: and the weight of each wheel is about three-quarters of a hundred.—Two inconveniences, however, arise from the use of low cast-iron wheels; namely, 1. That such iron is very liable to break upon concussion; and, 2. That the course of a wheel of so small a diameter, occasions a very quick consumption of grease. The first of these objections is, in a great measure, removed by the facility with which the rim of the wheel may be repaired by the application of wrought-iron; the latter being joined to the former by a rivet, the wheel acquires a degree of elasticity, and thus becomes, perhaps, stronger than it was when new. In order to furnish a regular supply of grease, Lord Robert has introduced four grooves or cavities in the boxes, increasing a little towards their centres: and with a view to defend the axle-tree, which consists of wrought-iron, against the harder body of the box, he ordered the extremity of it to be steeled.

Mr. Arthur Young, in the 18th volume of his *Annals of Agriculture*, before quoted, states the following dimensions of a single-horse cart, which he, by the test of experience, has found to be the most advantageous:

Buck.—Length, 5 feet 1 inch.
Breadth, 3 feet 7 inches.
Depth, 2 feet.

Cubical feet, 35 and a fraction.

On his farm of 350 acres, in Suffolk, Mr. Young employs only five such carts; and observes, that he would not add more than one to the number, even though he should increase his business to 400 or 500 acres: hay, corn in the straw, fagot-wood, billets, dung, clay, marl, lime, bricks, &c. are all conveyed by them; carrying out nine, and even ten coombs of wheat in sacks, and they are never drawn by more than one horse or ox.—No farm of the same extent, in an arable country, has less than three waggons, three tumbrils, and a light cart: the exact price of these different implements, in the year 1792, amounted to 109l.; while the building of six carts, upon Mr. Young's plan, costs only 63l.: thus he saves about 40 per cent. in annual repairs. Besides this great reduction of expence, another circumstance deserves particular notice.—As these carts had for many years been the object of ridicule, Mr. Young offered a bet to one of his prejudiced neighbours, that he should load a waggon, till five horses could not stir with it; and Mr. Young engaged to carry away that load with ease, in his carts, with four of the same horses; but the confidence which his antagonist possessed in waggons would not allow him to accept the offer.

The infinite benefit, concludes Mr. Young, of which these carts would be to the roads, if their use should become general, may be easily conceived. In all the examinations before committees of the House of Commons, as well as in most of the treatises published on the subject, it has been admitted that no police or management can keep the roads in repair, while such weights are permitted to be drawn in a single cart, while Parliament has been made so sensible of this fact, that repeated acts have been passed, by which the weight of waggons was limited, and a certain breadth of the wheels enjoined. Experience, however, has proved, that both are insufficient; and that the only method of effecting a favourable change, would be to prohibit numerous teams. Let every man carry whatever weight he pleases in one-horse carts, and pay a light toll; led the load of a two-horse cart be limited, and the toll increased; further lessening the weight, and raising the toll, when four horses are employed; and thus advancing the turnpike expences for every additional horse, till it amounts nearly to a prohibition. If such a plan were to be adopted, we should soon see all our roads in an improved state. Rollers have, indeed, been greatly indulged both in weight and toll; but this was a preposterous measure, for a roller will crush a pebble to dust, as well as a wheel, and the badness of roads must be attributed to the materials being reduced to powder, almost as soon as laid on, and either blown away in dust, or carried off in mud. Having followed some of Sharp's waggons, and observed the effect, Mr. Young is persuaded, that the roller is more detrimental to the road than nine-inch wheels. In such an enquiry, facts only can decide the question: the Irish roads are made at an expence beyond comparison less than the English, and were at the time he visited that country greatly superior to those in England. This difference, in his opinion, must be attributed entirely to the use of one-horse carts, as he has explained in his *Tour of Ireland*. “Many hundred thousands a-year would be saved in England, if these carts were so favoured in road-acts, as to ensure a great decrease of waggons.” On the whole, he ventures to recommend the use of one-horse carts to his brother farmers, with that confidence

which ought to arise solely from numerous and varied experiments.

Having concluded the subject of single-horse carts, we shall only observe, for the information of those who employ teams with two-wheeled carriages, that several useful implements have lately been invented, for the more effectual stopping of such carts, in descending steep hills, and likewise for taking off the increased weight thrown on the shaft horse's back in all descents. See a description of the latter contrivance, under the head of **LOCKING-POLE**. The **WHEEL-DRAW** is represented in Pl. 19. where *a, a, a, a*, is a piece of wrought-iron, curved to the exact form of a cart-wheel, with the thickest part at *b*, on which the weight of the cart rests. 1, 2, 3, 4, are shoulders, that keep the wheel within the drag, and should be about four inches high. *c*, is the wheel, made of solid iron, which is nearly as wide as the drag, seven inches in diameter; runs on its axis at *d*; has a strong shoulder; and, as it projects, resists the sudden jolts of rough roads. *e*, is the chain to be fastened to the near shaft, in order to keep the drag properly under the wheel, which, from being violently jerked, might be apt to pass over the drag, and leave it behind: this is a necessary precaution, though seldom wanted if the drag be well constructed. In the shoulders marked 1, 2, are holes, by which the drag is suspended on hooks beneath the tail of the cart when it is not employed.

In London and Westminster, carts are not permitted to carry more than twelve sacks of meal, 750 bricks, one chaldron of coals, &c. on pain of forfeiting one of the horses (stat. 6 Geo. I. c. 6).—By the laws of the city, carmen are forbidden to ride either on their carts or horses: they are to lead or drive them on foot through the streets, under the penalty of 10s.

Rolling carts are very useful machines for carrying manure on low-lands during wet seasons. According to an account given by Mr. Richard Moyle, and inserted in the 14th volume of the Transactions of the Society for the Encouragement of the Arts, &c. such a cart consists of three circular pieces of strong elm, two feet in diameter, and each eighteen inches long, through which a strong iron axis is passed, so as to protrude a few inches on each end beyond the rollers; after all, allowing an inch between each piece, for the convenience of turning round. On the projecting part of the axis, a fixed frame is placed, for supporting the body of the cart, which, according to the nature of the soil, may be loaded to any degree, and employed simply as a roller, or for carrying manure, &c. on land where common wheels cannot be admitted.

By means of these rolling carts, the surface of the land is to be frequently compressed, in order to consolidate the soil more perfectly, so that the earthy particles may embrace the roots of the grasses, and retain their proper moisture; on which the luxuriance of such soils in a great measure depends.

By 28 Geo. III. c. 93, there shall be paid for every carriage with less than four wheels, to be drawn by one horse, which shall be built wholly of wood and iron, without any covering other than a tilted covering, and without any lining or springs, or any ornament whatever, other than paint of a dark colour for the preservation of the wood or iron only, and which shall have the words "A TAXED CART," and also the owner's name and abode, thereon, and the price of which (repairs excepted) shall not have exceeded or which shall not at any time exceed twelve pounds, the annual sum of 11 and 4s.

But nothing herein shall authorise any person to keep any carriage as a taxed cart, who shall be liable to the duties for any four-wheel carriage, or for two male servants; but every such person shall be liable to the full duty of four pounds four shillings, imposed on carriages with two wheels.

Also all carriages, of whatever construction the same may be, which shall be let out to hire, shall be subject to the duty of 41. 4s.

But no person affected to the duty of 11. 4s. shall be charged in respect thereof with the additional duties granted by the triple assessment act of this session. And if any cart shall have been assessed, the commissioners may, on appeal, cause the assessments to be vacated, but so as not to annul any payment already made, nor the collection of any arrears: but such appeals are not to be heard till after ten days' notice to the surveyor; and in case either the party, or surveyor, shall be dissatisfied, they may demand a case, in like manner, as for other assessed taxes.

Persons occupying farms, or carrying on trades, and making a livelihood solely thereby, and ecclesiastical persons not possessed of an annual income of one hundred pounds or upwards, whether arising from ecclesiastical preferment, or otherwise, who shall keep any carriage subject to the duty hereby granted, shall be charged, in respect of the horse, at the rate prescribed for horses not kept for the purpose of riding, or drawing carriages, so as such horse be not at any time used for riding or drawing carriages.

Every person to be rated as aforesaid, shall paint on a black ground in white letters, or on a white ground in black letters, on the outside of the back panel, or back part of such carriage, or if it be constructed without a back part on which they may be painted, then on the side, or some conspicuous part on the outside, his christian and sur-names, and the place of his abode, and the words "A TAXED CART," in Roman letters, and in words at full length, each at least one inch in length, and shall, upon demand, produce such carriage to the assessor or surveyor, or at any meeting of the commissioners; and if any person shall keep any such carriage, the price whereof, or for any subsequent addition (repairs excepted), have been charged (the proof of which shall lie on the owner) at more than 121. or if the value thereof shall appear to the commissioners, on examination, to exceed 121. or if such carriage shall be built contrary to the provisions before mentioned, or shall not be so marked, or if such person shall neglect or refuse, upon demand, to produce the carriage, such person shall be charged with the duty of 41. 4s.

Nothing herein shall subject to the said duty of 11. 4s. any cart whatever which shall be kept without fraud to be used wholly in the affairs of husbandry or of trade, by reason of the owner or any of his servants riding therein, when laden, or when returning from, or going to, any place, to or from which any load shall be to be carried in the course of husbandry, or for the purpose of trade, or for conveying the owners thereof, or their families, to or from divine service, on Sundays, or for carrying persons going to or returning from the election of members of parliament.

CART, the name of two rivers of Renfrewshire, in Scotland, distinguished by the appellation of *Black* and *White*. The *Black Cart* issues from the lake called Lochwinnoch, or Castle Semple Loch; the *White Cart* descends from the north-east angle of the county; and, uniting their streams, they both flow into the Clyde, near Renfrew. Opposite this town, in the road to Port Glasgow, is a handsome bridge of ten arches, built exactly at the confluence of these two rivers. Three roads meet upon this bridge, so that it has three ends or entrances.

CARTERET ISLAND, an island of the South Pacific Ocean, seen by Captain Carteret in 1767. It is about six leagues long from east to west. Long. 159. 14. E. Lat. 8. 26. S.

CARTHAGO, a rich trading town of North America, in Mexico, with a bishop's see, 360 miles west of Panama. Long. 85. o. W. Lat. 9. 5. N.

CARTHAMUS (*Encycl.*). Having in the article *Dyeing* referred to **CARTHAMUS**, we think it necessary to speak more at large on its qualities. We shall therefore present the reader with the account given of it by Berthollet.

“ *Carthamus* contains two kinds of colouring matter; the one, yellow; the other, red. The first alone is soluble in water: its solution is always turbid; with re-agents it exhibits the appearances commonly observed in yellow colouring matter: acids render it lighter, alkalies make it deeper, and more approaching to orange: both produce a small portion of a fawn-coloured precipitate by means of which it becomes clearer. Alum forms with it a deep yellow precipitate in small quantity: solution of tin, and other metallic solutions, precipitates which have nothing remarkable.

“ Alcohol acquires but a slight tincture from the flowers, after all the yellow substance has been extracted by repeated washings. If these flowers be put into a solution of caustic alkali, they become yellow, and the liquor which is pressed out is of a deep yellow colour. On saturating the alkali with an acid, the liquor becomes turbid, reddish, and gradually deposits a very small quantity of a reddish yellow precipitate. With solutions of alum, zinc, and tin, a yellow precipitate is formed; and with solutions of iron and copper, a precipitate inclining to green. If instead of a solution of caustic alkali, a solution of carbonate of alkali be used, acids produce with it a more copious precipitate of a redder hue: but the redness differs according to the acid employed. Alum also produces with the latter alkaline solution, a red precipitate, which is so light, that it generally swims on the surface of the liquor. This colouring matter is so delicate, and so easily changed, that if heat be employed to dissolve it, the precipitates produced by acids will not have so fine a colour.

“ Mr. Beckmann has observed, that the carthamus of Thuringia contained much more of the yellow matter, than that of the Levant: that in other respects the red matter of the former was by no means inferior in beauty to that obtained from the latter: yet, that to produce equal effects, half as much more of it was required. He next examined, whether this difference depended on the climate, or only on the mode of preparation.

“ Hæfcliquist relates, in his travels in Egypt, that when the flowers of carthamus are gathered, they are pressed between two stones, to squeeze out the juice. After this they are washed several times with water, which in Egypt is naturally salt. When taken out of the water they are pressed between the hands, and then spread on mats, placed on the flat roofs of their houses; where they are covered in the day-time, that the sun may not dry them too fast, but left exposed to the dew at night. They are occasionally turned, and when sufficiently dry, taken in, and kept for sale under the name of *saffron*.

“ If the carthamus of Levant, such as it is in commerce, be compared with that of Thuringia, the former will be found to be more pure, a little moist, and in compressed masses; the latter, drier and more elastic. These differences depend on the preparation. Writers on agriculture, deceived by the erroneous name of *bastard saffron* given to carthamus, have supposed, that it should be treated like saffron. Hence they direct it to be gathered in a dry season, and dried with care. Mr. Beckmann thinks, on the contrary, that the mode adopted in Egypt ought to be imitated. He advises even to add a little salt to the water used in preparing it, to give it the quality it has naturally in Egypt.

“ The flower of carthamus has a fine colour of fire, but in drying it grows yellow. It should not be gathered till it grows dry; and it is better if it has been rained upon in that state, though the contrary opinion is erroneously held. The want of rain may be supplied by watering the flowers morning and evening. When they are gathered, the seeds may still be left to ripen.

“ The intention of these directions is, to promote the separation of the yellow matter, the abundance of which constitutes the difference between the carthamus of our climates, and that of the Levant. Carthamus should be kept in a moist place, as its becoming too dry would be injurious.

“ There are many reasons to induce us to enrich our agriculture with this production. The seeds of carthamus are very good food for wild fowl, and particularly for parrots, whence they have received the name of grain de perroquet. An useful oil might be expressed from them, and the residue given to cattle. The dry leaves and stalks would serve as fodder for sheep and goats in the winter; and those stalks which are too large might be used as fuel, after they had stripped them. Mr. Beckmann has found the carthamus ripen well at Gottingen, where the soil is sandy. The ground should be moderately dunged; and the plant neither transplanted nor watered.

“ No use is made of the yellow substance of carthamus: but to extract that part, it is put into a bag and trodden in water, till no more colour can be pressed out. The flowers, which were yellow, become reddish in this operation, and lose nearly half their weight: it is in this state they are used.

“ The yellow substance might however be employed: and Mr. Poerner has made many experiments on the subject. (Vide *Chemische Versuche und Bemerkungen zum Nutzen der Farbekunst*; dritter Theil.) The principal results of his experiments were, that wool, without any preparation, takes from it a yellow colour, which is not permanent; but that which it takes after having been prepared with alum and tartar, though not very lasting, is better. Mr. Beckmann asserts, that cloth prepared with tartar, or with tartar and alum, acquires from it a good yellow colour; and that carthamus contains more yellow colouring matter than an equal weight of fustic itself.

“ To extract the red part of carthamus, and afterwards apply it on the stuff, recourse is had to the property alkalies possess of dissolving it; and it is precipitated by means of an acid. It has been found, that lemon-juice produces the finest colour. Mr. Beckmann says, that next to this, the sulphuric acid produces the best effect, provided a proper quantity only be used.”

CARWAR, a sea-port of the peninsula of Hindoostan, on the coast of Malabar. It was subject to Tippoo Sultan, regent of Myfore, and is sixty miles S. by E. of Goa. Long. 74. 34. E. Lat. 15. 0. N.

CASA DEL CAMPO, a palace belonging to the king of Spain, seated on the west side of Madrid, opposite the castle on the other side of the river.

CASCO BAY, a bay on the east of the province of Maine, in New England, situated between Cape Elizabeth, and Cape Small Point. It is twenty-five miles wide; and is a beautiful bay, interspersed with small islands. Long. 69. 30. W. Lat. 44. 5. N.

CASBIN, or CASWIN, a considerable town of Persia, in Irac Agemi, where several of the kings of Persia have resided. The houses are below the surface of the earth. The air is subject to such sudden changes, from heat to cold; and the contrary, that it is very unwholesome for strangers. Nadir Shah built a palace here, inclosed by a wall a mile and a half in circumference; and the town is encircled by one four miles in circuit. It carries on a great trade, and is seated near the high mountain Elwend, where there are fine quarries of white marble, 180 miles north of Isfahan. Long. 52. 16. E. Lat. 35. 30. N.

CASCHAW, or CASSOVIA, a town of Upper Hungary, on the river Horat, 115 miles north-east of Buda. Long. 27. 25. E. Lat. 48. 46. N.

CASHGUR, a kingdom of Asia, in Tartary, otherwise

called Little Bokharia; bounded on the north by the Calmucs and Monguls, on the east by Thibet and the deserts of Gobi, on the south by Hindoostan, from which it is separated by the high mountains of Hindoo-ko, and on the west by Great Bokharia. This country is populous and fertile, but the air is cold, on account of the mountains. Here are rich mines of gold and silver, which the natives do not work, because they are employed wholly in feeding cattle. The mink-animals are found in this country; and they have several precious stones beside diamonds.

CASHGUR, a town of Asia, capital of a kingdom of the same name. It stands at the foot of the mountains, and enjoys a good trade with the neighbouring countries. The houses are of stone, and very good. Both sexes dress alike. Their complexion is swarthy, and they have all black hair. Long. 73. 25. E. Lat. 41. 30. N.

CASHNA, an extensive empire in the centre of Africa, being part of the region called Soudan, by the Arabs, and Nigritia or Negroland by the Europeans. It is bounded on the north by the mountains of Eyre, which separate it from Fezzan, and by a district of Zahara in the Desert; on the south by the Niger; and on the east by the kingdom of Zamphara and the empire of Bornou. It resembles Bornou much in climate, soil, and natural productions, and in the colour, genius, religion, and government of the people. The rains, indeed, are less violent than those of Bornou. Its monkeys and parrots (but seldom seen in Bornou) are numerous and of various species. The common people are less courteous in Cashna than in Bornou. A thousand towns and villages are said to be included in this empire, which, like Bornou, consists of different tribes or nations, subject to the dominion of one ruling power.

CASHNA, the capital of the empire of Cashna in Africa. It is 370 miles S. by W. of Mesurata, in 16. 20. N. lat.

CASSERTA, a magnificent palace of his Sicilian majesty, sixteen miles north of Naples. This immense building is of a rectangular form, 780 feet by 580; about 112 feet high, comprehending five habitable stories, which contains such a number of apartments, as to accommodate the most numerous court, without any accessory buildings. The gardens are proportionably extensive and magnificent.

CASSOVIA, a strong town of Hungary, with the finest arsenal in that kingdom. It is near the river Horat, fifty-five miles north-east of Agria. Long. 21. 25. E. Lat. 46. 48. N.

CASTELLANE, a pleasant town in France, in the department of the Lower Alps and late province of Provence. It is seated on the river Verdon, in a mountainous country, which, however, is fertile in corn and pasture. About a mile from the town, is a salt spring, from which the water issues in such abundance as to turn the mill at the very source. Many of the ancient lords of Castellane were distinguished among the Provençal poets, called Troubadours. It is twenty-seven miles S. by E. of Senez. Long. 6. 34. E. Lat. 43. 55. N.

CASTELLAZO, a town of Italy, in the duchy of Milan, remarkable for a battle fought between the French and Austrians in 1704. It is two miles east of Alexandria. Long. 8. 50. E. Lat. 45. 3. N.

CASTELÓN, a town of Spain, in Catalonia, five miles N.W. of Roses. Long. 2. 58. E. Lat. 42. 18. N.

CASTELNAUDARY, a considerable town of France, in the department of Aude and late province of Languedoc, on an eminence, at the foot of which is the Royal Canal, which here forms a basin about 3600 feet in circumference. Near this town, in 1632, Marshal Schomberg defeated the army of Gaston duke of Orleans, and took the unfortunate Montme-

rency prisoner. Castlenaudary is fifteen miles west of Carcassonne. Long. 2. 0. E. Lat. 43. 19. N.

CASTELVETRO (*Encycl.*). Erroneously spelt CASTELVERTO.

CASTON, a town in Norfolk, with a market on Monday. It is ten miles N. by W. of Norwich, and 113 north-east of London. Long. 1. 22. E. Lat. 52. 48. N.

CASTOR, a town of Lincolnshire, with a market on Saturday. It is twenty miles north-east of Lincoln, and 159 north of London. Long. 0. 9. W. Lat. 53. 30. N.

CASTRO, a town of South America, in Chili, capital of the island of Chiloe. It is 180 miles south of Baldivia. Long. 75. 5. W. Lat. 42. 4. S.

CASTRO-DEL-REY, a town of Spain in the province of Galicia. Long. 3. 24. W. Lat. 43. 20. N.

CASTRO-MARINO, a town of Portugal, in Algarve. It is strong by situation, and seated near the mouth of the Guadiana, fifty-five miles S. of Beja. Long. 7. 12. W. Lat. 37. 6. N.

CASTRO-VEREGNA, a town of South America, in Peru, remarkable for mines of silver, good tobacco, and wholesome air. It is 125 miles south-east of Lima. Long. 74. 45. W. Lat. 12. 50. S.

CATACOSTICS. See ACOUSTICS in this SUPPLEMENT.

CATHARINE I. Empress of Russia, was raised to that dignity, from the condition of a menial servant, by the discerning Peter the Great, who married her in 1711. She attended the emperor in all his expeditions; and when he was surrounded by the Turks on the banks of the Pruth, his army was saved by her prudent advice. Peter afterwards never resolved on any affair of consequence without first consulting her; success attended him in every thing, and the court of Peterburgh appeared in a new light. He instituted the order of St. Catharine in her honor, which he gave her power to bestow on such of her sex as she judged proper; and, finally, appointed her his successor. On the death of her husband, she took all proper means to secure the quiet, advance the civilization, and promote the general welfare, of her kingdom; and it is more than probable, that the late illustrious Empress Catharine II. considered her as a bright example: for Catharine I. established the Academy of Sciences at Peterburgh, now brought to such perfection. She likewise increased the naval force of Russia: and set on foot a design for discovering the north-east passage to China. "The lenity of this prince's (says Voltaire, in his Life of Peter the Great) was carried to a degree unparalleled in the history of any nation. She promised, that during her reign nobody should be put to death; and she kept her word: she was the first sovereign that ever shewed this respect to the human species. Malefactors were condemned to work in the mines, and other public works; a regulation not less prudent than humane, since their punishment was rendered of some advantage to the state." She died on the 17th of May, 1727; leaving issue, Anne who married Frederic duke of Holstein, and Elizabeth afterwards empress of Russia.

CATHARINENSIAE, or ECATERINENSIAE, one of the governments of the Russian empire, being the new name of the extended government of Aloph, which is now made to comprise New Russia and the Crimea. This government is divided into two provinces; namely, Catharinensla, which includes New Russia and the late government of Aloph; and the province of Taurida, which includes the Crimea.

CATHARINENSLAE, the capital of the province of the same name, built by the late Empress of Russia. It is seated near the spot where the river Kiltzin falls into the Samara. Its

name signifies, "The glory of Catharine;" and it is colonized by many Greeks and Armenians from Cym Tartary, and others of the nations who served in the preceding war against the Turks. It is 178 miles N.E. of Cherson. Long. 35° 15'. E. Lat. 47° 23'. N.

CATMANDU, the capital of Napaul, in Hindoostan Proper, 445 miles E. of Delhi. Long. 84° 51'. E. Lat. 28° 6'. N.

CATOUCH, CAPE, the N.E. promontory of Yucatan, in South America. Long. 86° 30'. W. Lat. 22° 10'. N.

CATTACK, or COTACK, the capital of Orissa, a province of Hindoostan, in the Deccan. It is a post of consequence, as it lies on the only road between Bengal and the Northern Circars; and the possession of the city and its dependencies gives the Berar rajah (a Mahratta prince) more consequence in the eyes of the government of Bengal, than even his extensive domain and central position in Hindoostan. Cattack is seated on the river Mahanuddy, near its entrance into the bay of Bengal, and 220 miles S.W. of Calcutta. Long. 86° 1'. E. Lat. 20° 51'. N.

CATTARICK, a village, near Richmond, in the W. riding of Yorkshire. It has a bridge over the river Swale, and there is a fort of catarrack near it, from which it seems to have derived its name. It appears to have been a great city in the time of the Romans, one of whose highways crossed the river here. On the banks of it are the foundations of great walls, and a mount cast up to a vast height. Many Roman coins and urns have been dug up here. The final destruction of this city was by the Danes.

CATTERTHUN (*Encycl.*). This Caledonian post is, by Mr. Pennant, described as of uncommon strength. "It is (says he) of an oval form, made of a stupendous dike of loose white stones, whose convexity, from the base within to that without, is 122 feet. On the outside, a hollow, made by the disposition of the stones, surrounds the whole. Round the base is a deep ditch, and below that about 100 yards, are vestiges of another, that went round the hill. The area within the stony mound is flat; the axis, or length of the oval, is 436 feet, the transverse diameter 200. Near the east side is the foundation of a rectangular building; and on most parts are the foundations of others small and circular: all which had once their superstructures, the shelter of the possessors of the post: there is also a hollow, now almost filled with stones, the well of the place." There is another fortification, but of inferior strength, in the neighbourhood. It is called the *Brown Catterthun*, from the colour of the ramparts, which are composed only of earth. It is of a circular form, and consists of various concentric dikes. On one side of this rises a small rill, which, running down the hill, has formed a deep gully. From the side of the fortrefs is another rampart, which extends parallel to the rill, and then reverts, forming an additional post or retreat.

CAVENDISH (Margaret) duchess of Newcastle, famous for her voluminous productions, was born about the latter end of the reign of James I. and was the youngest sister of Lord Lucas of Colchester. She married the Duke of Newcastle abroad in 1645; and on their return after the Restoration, spent the remainder of her life in writing plays, poems, with the life of her husband, to the amount of about a dozen folios. "What gives the best idea of her unbounded passion for scribbling (says Mr. Walpole), was her seldom revising the copies of her works, lest, as she said, it should disturb her following conceptions." She died in 1673.

CAUCASUS, one of the 41 governments into which the Russian empire has been lately formed. It is divided into the two provinces of Astracan and Caucasus, but is not yet subdivided into districts. The province of Caucasus is to comprize the

Cuban, and all that district to the E. and S. now in the possession of Russia, between the rivers Don and Cuban, and between the Black Sea and the Caspian, extending as far as the confines of Georgia, and continually augmenting by the reduction and submission of the wandering hordes of Mount Caucasus.

CAUNE, LA, a small town of France, in the department of Tarn and late province of Languedoc, seated near the mountains, where the river Agout has its source. It is 21 miles N.E. of Castres. Long. 2° 43'. E. Lat. 43° 40'. N.

CAUVERY, or CAVERY, a considerable river of the peninsula of Hindoostan, which rises among the Ghauts, takes a S.E. direction through Mysore, and watering Seringapatam and Tanjore, enters the bay of Bengal, by several mouths, between Cuddalore and Trichinopoly.

CAUSTICITY (*Encycl.*). The causticity of bodies depends entirely on the state of the saline, and chiefly of the acid, matters they contain. When these acids happen to be at the same time much concentrated, and slightly attached to the matters with which they are combined, they are then capable of acting, and are corrosive or caustic. Thus fixed and volatile alkalies, although they are themselves caustic, become much more so by being treated with quick-lime: because this substance deprives them of much fat and inflammable matter, which binds and restrains the action of their saline principles. By this treatment, then, the saline principle is more diffused, and rendered more capable of action. Also all combinations of metallic matters with acids form salts, more or less corrosive, because these acids are deprived of all their superabundant water, and are besides but imperfectly saturated with the metallic matters. Nevertheless, some other circumstance is necessary to constitute the causticity of these saline metalline matters. For the same quantity of marine acid, which, when pure and diluted with a certain quantity of water, would be productive of no harm, shall, however, produce all the effects of a corrosive poison, when it is united with mercury in *corrosive sublimate*, although the sublimate shall be dissolved in so much water that its causticity cannot be attributed to the concentration of its acid. This effect is, by some chemists, attributed to the great weight of the metallic matters with which the acid is united: and this opinion is very probable, seeing its causticity is nothing but its dissolving power, or its disposition to combine with other bodies; and this disposition is nothing else than attraction, which is one and the same thing as weight or gravitation.

The best method of *destroying the activity of corrosive sublimate* taken into the stomach, is to give free and repeated doses of a *solution of any alkaline salt*, as pot-ash, or salt of tartar. By this means Dr. Houlston succeeded, at Liverpool, in recovering a person who had swallowed half an ounce, with the intention of suicide.

CAUTERETS, a village of France, in the department of the Upper Pyrenæes and late province of Bigorre, noted for its mineral water. It is 18 miles S.W. of Bagnères.

CAWOOD, a town in the E. riding of Yorkshire, with a market on Wednesday, 12 miles S. of York, and 186 N.W. of London. Long. 1° 0'. W. Lat. 53° 47'. N.

CAXTON, a town in Cambridgeshire, with a market on Tuesday. It is 10 miles W. by S. of Cambridge, and 49° N. of London. Long. 0° 10'. W. Lat. 10° 0'. N.

CAYA, a river of Portugal, which rises near Portalegra, and running S.E. divides Spain from Portugal, and falls into the Guadiana, at Badajoz, in Spanish Estramadura.

CAYLUS (Count de) (*Encycl.*). We think it due to the memory of this extraordinary man to add to our original article the following particulars. The French Academy of

Painting and Sculpture adopted him an honorary member in the year 1731; and the count, who loved to realize titles, spared neither his labour, nor his credit, nor his fortune, to instruct, assist, and animate the artists. He wrote the lives of the most celebrated painters and engravers that have done honour to this illustrious academy; and, in order to extend the limits of the art, which seemed to have to move in too narrow a circle, he collected, in three different works, new subjects for the painter, which he met with in the works of the ancients.

Such was his passion for *antiquity*, that he wished to have had it in his power to bring the whole of it to life again. He saw with regret, that the works of the ancient painters, which have been discovered in our times, are effaced and destroyed almost as soon as they are drawn from the subterraneous mansions where they were buried. A fortunate accident furnished him with the means of shewing us the composition and the colouring of the pictures of ancient Rome. The coloured drawings which the famous Pietro Sante Bartoli had taken there from antique pictures, fell into his hands. He had them engraved; and, before he enriched the king of France's cabinet with them, he gave an edition of them at his own expence. It is perhaps the most extraordinary book of antiquities that ever will appear. The whole is painted with a purity and precision that are inimitable: we see the liveliness and the freshness of the colouring that charmed the Cæsars. There were only 30 copies published; and there is no reason to expect that they will hereafter be any more.

Count de Caylus was engaged at the same time in an enterprise still more favourable to Roman grandeur, and more interesting to the French nation. Colbert had framed the design of engraving the Roman antiquities that are still to be seen in the southern provinces of France. By his orders Mignard the architect had made drawings of them, which Count de Caylus had the good fortune to recover. He resolved to finish the work begun by Colbert, and to dedicate it to that great minister: and so much had he this enterprise at heart, that he was employed in it during his last illness, and warmly recommended it to M. Mariette.

In 1742 Count Caylus was admitted honorary member of the Academy of Belles-lettres; and then it was he seemed to have found the place for which nature had designed him. The study of literature now became his ruling passion; he consecrated to it his time and his fortune; he even renounced his pleasures, to give himself wholly up to that of making some discovery in the field of antiquity. But amidst the fruits of his research and invention, nothing seemed more flattering to him than his discovery of encaustic painting. A description of Pliny's, but too concise a one to give him a clear view of the matter, suggested the idea of it. He availed himself of the friendship and skill of M. Magault, a physician at Paris, and an excellent chemist; and by repeated experiments found out the secret of incorporating wax with divers tints and colours, and of making it obedient to the pencil. Pliny has made mention of two kinds of encaustic painting practised by the ancients; one of which was performed with wax, and the other upon ivory, with hot punches of iron. It was the former that Count Caylus had the merit of reviving; and M. Muntz afterwards made many experiments to carry it to perfection.

In the hands of Count Caylus, literature and the arts lent each other a mutual aid. But it would be endless to give an account of all his works. He published about 40 dissertations, in the *Memoirs of the Academy of Belles-lettres*. The artists he was particularly attentive to; and to prevent their falling into mistakes from an ignorance of costume, which the ablest of them have sometimes done, he founded a prize of 500

livres, the object of which is to explain, by means of authors and monuments, the usages of ancient nations. In order that he might enjoy with the whole world the treasures he had collected, he caused them to be engraved, and gave a learned description of them in a work which he embellished with 800 copper-plates.

The tomb erected to the honour of Count Caylus is to be seen in the chapel of St. Germain-l'Auxerrois, and deserves to be remarked. It is perfectly the tomb of an antiquary. This monument was an ancient sepulchral antique, of the most beautiful porphyry, with ornaments in the Egyptian taste. From the moment he procured it, he had destined it to grace the place of his interment. While he awaited the fatal hour, he placed it in his garden, where he used to look upon it with a tranquil but thoughtful eye, and pointed it out to the inspection of his friends.

The character of Count Caylus is to be traced in the different occupations which divided his cares and his life. In society, he had all the frankness of a soldier, and a politeness which had nothing in it of deceit or circumvention. Born independent, he applied to studies which suited his taste. His heart was yet better than his abilities. In his walks he used frequently to try the honesty of the poor, by sending them with a piece of money to get change for him. In these cases, he enjoyed their confusion at not finding him; and then presenting himself, used to commend their honesty, and gave them double the sum. He said frequently to his friends, "I have this day lost a crown; but I was sorry that I had not an opportunity of giving a second. The beggar ought not to want integrity."

CEBU, one of the most southerly of the Philippine islands in the Indian Ocean.

CEDAR CREEK, a water of James River in Virginia, in the county of Rockbridge. It is sufficient, in the dryest seasons, to turn a grist-mill, though its source is not more than two miles above. But it is most remarkable for its natural bridge, which is certainly one of the most sublime of Nature's works. It is on the ascent of a hill, which seems to have been cleft through its length by some convulsion. The fissure, just at the bridge, is by some admeasurements 270 feet deep, by others only 250. It is about 45 feet wide at the bottom, and 90 feet at the top. This of course determines the length of the bridge, and its height from the water. Its breadth in the middle is about 60 feet, but more at the ends, and the thickness of the masonry at the summit of the arch about 40 feet. A part of the thickness is constituted by a coat of earth, which gives growth to many large trees. The residue, with the hills on both sides, is one solid rock of lime-stone. The arch approaches the semielliptical form; but the larger axis of the ellipsis, which would be the chord of the arch, is many times longer than the transverse. Though the sides of the bridge are provided in some parts with a parapet of fixed rocks, yet few men have resolution to walk to them, and look over into the abyss. You involuntarily fall on your hands and feet, creep to the parapet, and look over it. "Looking down from this height about a minute, gave me," says Mr. Jefferson, "a violent headach. If the view from the top be painful and intolerable, that from below is delightful to the extreme. It is impossible for the emotions arising from the sublime to be felt beyond what they are here: at the sight of so beautiful an arch, so elevated, so light, and springing as it were up to heaven, the rapture of the spectator is really indescribable! The fissure continuing narrow, deep, and straight, for a considerable distance above and below the bridge, opens a short but very pleasing view of the North Mountain on one side,

and Blue Ridge on the other, at the distance, each of them, of about five miles." This bridge gives name to the county of Rockbridge, and affords a public and commodious passage over a valley, which cannot be crossed elsewhere for a considerable distance.

CEDONGA, a town of the kingdom of Naples, with a bishop's see, at the foot of the Apennines, 12 miles N.W. of Melit. Long. 15. 38. E. Lat. 41. 5. N.

CEDRIA, a resinous liquor issuing from the great cedar tree, or cedar of Lebanon. The word is also written *cedrium*, and *cedrinum*.—Cedria, when good, yields a strong smell, is transparent, and of a thick fatty consistence; so that in pouring it out it does not fall too fast or freely, but equally, drop by drop. It is possessed of two opposite qualities, *viz.* to preserve dead bodies by its drying and consuming superfluous moisture without damaging the solid parts, and to destroy the soft and tender parts of living bodies without exciting any pain. The cedria is properly the tear of the cedar; some call it the gum, others the pitch, of the cedar. The same denomination is also given to the *cedrelæon*, or oil of the cedars, which differs little from the resin, except that it is of a thinner consistence.

CEFALONIA, a considerable island of Greece, to the S. of Albania, and to the N.E. of the Morea. It is fertile in oil, and excellent muscadine wine. The climate is hot, and there are blossoms on the trees throughout the winter. It is subject to the Venetians and the capital is of the same name. Long. 20. 36. E. Lat. 38. 22. N.

CEFALÙ, a town in Sicily, in the valley of Demona, with a castle, a harbour, and a bishop's see. Long. 13. 58. E. Lat. 38. 25. N.

CELTIBERIA (anc. geog.) a county of the Hither Spain, along the right or south-west side of the river Iberus: though sometimes the greatest part of Spain was called by the name of Celtiberia. The people were named *Celtiberi*, or the Celtæ seated on the Iberus. They were brave and warlike, their cavalry in particular was excellent. They wore a black and rough cloak, the flag of which was like goats' hair. Some of them had light bucklers like the Gauls; others hollow and round ones like those of other nations. They all wore boots made of hair, and iron helmets adorned with crests of purple colour. They used swords which cut on both sides, and poniards of a foot long. Their arms were of an admirable temper, and are said to have been prepared in the following manner; they buried their plates of iron under ground, where they let them remain till the rust had eaten the weakest part of the metal, and the rest was consequently hard and firm. Of this excellent iron they made their swords, which were so strong and well tempered, that there was neither buckler nor helmet that could resist their edge. The Celtiberians were very cruel towards their enemies and malefactors, but shewed the greatest humanity to their guests. They not only cheerfully granted their hospitality to strangers, who travelled in their country, but were desirous that they should seek protection under their roofs.

CEMENT (*Encycl.*). In July 1800 a patent was granted to Mr. John Baptist Denize, of Paris, chemist; for a new cement fit for various purposes. The inventor prefixes to the account of this discovery the following observations: "Convinced by repeated proofs," says he, "that the decay of mortars or cements in general use, occasioned by the alternate or combined efforts of damp or dry weather, was owing chiefly to the bad choice and imperfect preparation of the matters they are composed of; that their difficulty in adhering with any strength to various materials indifferently, but particularly to wood, to preserve it from rotteness and worms, and to iron, to prevent its growing rusty, was owing to the want of visco-

sity and clamminess to resist air, and to the water and salts which constitute their glutinous quality; and persuaded therefore that substances of a more fixed and identical nature, combined and glued together by a viscous body, unalterable in itself, and yet sufficiently unctuous and penetrating, so as to incorporate easily with the various objects on which it might be applied, would, on the contrary, form a composition the more useful and valuable as it would then possess qualities entirely opposite, I applied myself in the research of that object; and, after repeated essays (of which I shall hereafter give an account, as belonging to the subject), I succeeded in finding out the peculiar nature, proportions, and preparation, of these substances; the exact combination of which ascertains definitively the utility of my proceedings.

"*Indication of fixed matters.*—The materials which I employ in preference to those of which I shall afterwards give a list, agreeable to my foregoing observations, are, *viz.* First, all the various species of scoriaceous matters, metallic fumes, or drofs of iron, and generally all other kinds of remnants or fine dust found in forges and founderies, containing a great deal of metallic substances, adulterated by the effect of combustibles, principally iron, in very great quantities; or, instead of those various substances, old iron reduced to the same state by calcination, and pulverized by the effect of heat and charcoal; and all kinds of metallic dust and filings more or less reduced to that state; and in general every other produce of nature or of art in which metallic substances, especially iron, are found in a state of calcination, and chiefly carbonate. Secondly, all volcanic products, called ashes of volcanoes, and lava; particularly those which are reduced to the greatest state of attenuation, such as pozzolana and pumice-stone. Instead of those volcanic matters, one may almost as effectually employ ochres, and other ferruginous earth, particularly yellow oxide of iron (as painters make use of), or reddish-brown oxide, when calcined by the same degree of heat as that of a potter's kiln, or at least sufficient to reduce those substances to a state of demi-vitrification; or what remains after the distillation of acid nitre, by the means of solar earth, cleared of that acid by a strong calcination, and mixed with sulphat of iron, equally dissolved by the same means, and known in commerce by the name of *caput mortuum*, of *aqua fortis*, and of *colcothar*; or also all ashes produced from the incineration of vegetables, especially those of pit-coal, and charcoal of the hardest wood, from the identity of nature which subsists particularly between that species of ashes and the above-mentioned volcanic matters; or those various terreous and metallic particles which it has been proved by analyzing that the above-mentioned lava and ashes were composed of; such for instance, as *flex*, or *quartz*; that hard vitrifiable earth *alumine*, or pure clay *lime*, or chalky clay, *magnesia*, and *barytes*, or *terra-ponderosa*, and *manganese*, or any other metallic particle, especially iron; the whole mixed in proportions, more or less conformable to those which constitute the volcanic and vegetable ashes which I mentioned before, and calcined the same as ochres by a degree of heat sufficient to bring those particles more or less to that state in which they are by nature found, contained in those two kinds of produce; and in general all other combinations, whether natural or artificial, which, from the proportions and identity, or analogy of their terreous and metallic particles with those I have already mentioned, could produce the same effects; in this I comprehend, therefore, not only the various matters described in the list, subjoined to this specification, by reason of their being composed of the particles alluded to, but which I partly exclude from the composition of this cement, on account of the defects which I have found in them; but also, all

other kinds of compositions whatever, of a nature more or less analogous with those I have just now described. Thirdly, pit-coal of a flat hard nature, and that kind particularly which has a brightness in it like Kendal, or Cannel, coal: and fourthly, glass, or flint stone.

"Indication of glutinous matters.—First, sublimated sulphur: secondly, bitumen, made of pit-coal; in lieu of it either of those substances that derive therefrom, classed in the following order, viz. petrol, mineral, pitch, naphtha, asphaltos, or any other modification of pit-coal bitumen, equally proper to replace said substances; thirdly, tallow-pitch, known also under the name of pitch-rofin, and white-rofin, and, in short, every kind of resinous substance, whether natural or factitious, more or less analogous in its consistence and effects to the above ones; such as pitch, and tar, and every other produce of that kind: and, fourthly, that mucilage produced by the decoction of linseed, after it has been boiled sufficiently to a degree of consistence of about twice the thickness of the white of an egg. Instead of that mucilage, that of any other seed, plant, or animal substance susceptible of producing the same, or the equivalent, either of themselves or by the effect of their combination; or such mucilage as might be made out of various kinds of indigenous or exotic gums, whether resinous or not, with meal and feculum and other similar substances: or one may use also linseed oil, or any other kind of oil, or grease, of a defecative and mucilaginous nature, such as is extracted from poppies, nuts, pinks, &c.; or other vegetable and animal oils or grease, that are not by nature defecative, but which may be rendered so by their combination with other substances composed of defecative principles, such as the various kinds of gums, and wax, spermaceti, oils of turpentine, or those matters from which they are extracted; oxides and acids, or any other defecative substance whatever.

"Preparation of fixed matters.—In order better to impregnate those fixed matters with the gluten which is to combine and unite them together, they must be first prepared as follows: viz. the dross of iron, the pozzolana, and pumice-stone, or the other kinds of metallic scums and volcanic matters, must be well cleared of all saline, terreous, sulphureous, stony, or those particles extraneous to them, and reduced to a powder as fine as that of well-calcedined ashes; and the ashes which might be substituted to the above-mentioned volcanic products, or those terreous and metallic particles which I also indicated as a substitute to these, must be calcined till they become white, provided they have not already undergone that operation by fire; then washed in lye, to extract by these two operations the sulphates and salts which might be mixed with them, and afterwards well dried and sifted. With regard to pit-coal, glass, or flint-stone, they must also be reduced to a very fine powder like that of ashes, and sifted afterwards.

"Preparation of the gluten.—Take sublimated sulphur in the proportion of one-eighth more or less to the quantity or volume of cement which you intend to make, mix with it one-third more or less of pit-coal bitumen, then let it dissolve on a slow gradual fire till it insensibly rise up in momentary bubbles; stir the mixture during that time, and when it is completely dissolved take it off the fire and add to it, whilst you continue to stir, one-third more or less of black pitch; then let it sit on the same slow fire again till it has risen up gradually as before; take it then once more off the fire, and add one-twentieth more or less of the total weight of fixed and glutinous matters, composed of a mixture of two equal portions of good tallow, or any other hard grease, and of white clear rosin or wax, and mix then the whole on the same fire again till it is perfectly dissolved and combined together; or in order to render the cement more fluid, and thereby more

easy of application, to the one-eighth in volume (not in weight) of sublimated sulphur well dissolved, with the one-third of pit-coal bitumen, add one-third part, in volume also, composed of one-sixth part of good tallow melted together; and after you have well mixed the whole on the fire, add one more third part, in volume also, composed equally of one-sixth part of pit-coal bitumen well mixed together whilst cold; (*a sixth part of some other substance appears to be omitted*); or instead of this a same third part, in volume always, of linseed oil, or of any other defecative oil, and lastly one more third part composed of two portions, equal in weight, of black pitch and of rosin melted together: and after you have equally well mixed these matters with the rest, and stirred the whole on a slow fire for a while sufficient to unite and combine them perfectly together, use this bituminous composition, or the one preceding, in the manner indicated hereafter.

"Composition of the cement.—To either of the two glutinous compositions above mentioned, made perfectly liquid by fire, add at several times, in order the better to combine them together, the following proportions of fixed matters, well mixed and sifted together: viz. three-fourths in volume (not in weight) of dross of iron, one-eighth of pozzolana, and one-eighth of pumice-stone, or the same quantity of two substances the most analogous to those volcanic matters, such as I have mentioned as substitutes for them, one-eighth of pit-coal being named, and one-eighth of glass or flint-stone; let the whole boil on a fire sufficiently great to keep those materials in a state of fusion, but not so much as to cause the volatile principles to evaporate, which must be guarded against. Stir now and then so as to bring the fixed matters up from the bottom to the surface in order to combine them better, and after three or four times boiling, for that cement made with the first kind of glutinous composition, or double that time for that made with the other kind, make a trial of it by laying some of it on wood, and passing the trowel with which you stir hard over it, to judge whether and how much it requires longer to be boiled. One sees that it is done, when after being laid on the wood it becomes hard as it gets cold, and that though still warm it does not stick to the hand, with which you must therefore press hard upon it. If one should delay too long to make that trial, the cement might be boiled too much, which would then take from its viscosity, and would make it necessary to remedy this by the addition of one-twentieth part of the weight of it, more or less, according to the degree of its adulteration, of either tallow, bitumen, or pitch. But if the cement does not possess the above properties when that trial is made, it must then be boiled, stirring it always till it has acquired the same. In general the more equal the fire is, the better will the cement be, provided the volatile principles do not evaporate. It would on that account be advisable to boil that composition by the heat resulting from boiling water and in an uncovered vessel, for by that means this composition would be rendered (even should a great proportion of glutinous principles be added thereto) extremely compact, and as hard as it may be wished, without depriving it (for all that) of those unctuous and penetrating qualities which render it so valuable.

"Manner of employing the cement.—It is first broken in small pieces, then you add to it one-fortieth part, more or less, of its weight of good tallow, or other hard grease, or instead of them not quite a fortieth of black pitch, asphaltos, rosin, or wax, or only half that proportion of pit-coal bitumen, mineral pitch, naphtha, or some defecative oil: but if it was intended to employ that cement (especially that made with less glutinous principles) for the purpose of joining or cementing more quickly, it would then be proper to add one half more than

the fortieth part of the above-mentioned matters. The whole is then melted and liquified for a quarter of an hour in an earthen vessel, or one of cast iron, whilst you continue to stir it on a slow fire, or what would be better, on the heat of boiling water, the same as it is done for glue; after which you take that composition from the bottom of the vessel whilst you still continue to stir, and make the application of it immediately. It is necessary to observe, that when the cement appears to become too dry, from its long continuance on the fire, one must then add to it a small portion of the matters before mentioned, in order to give it that unctuous quality again, and to keep it so in that state during the time that you make use of it. Experience will however better teach what proportion of these matters will be required occasionally, and their choice.

Secondary methods of making this cement.—As the composition of this cement may be varied by the different choice and proportions of glutinous matters relatively to the more or less fixed nature of the others, and by the boiling it for more or less time, as I have myself ascertained the same by many experiments (for instance, by the composition and application of that cement without the use of fire), I reserve to myself the privilege of those various modifications, as being a direct practice of that same theory and appertaining necessarily to this invention. With regard to the various substances which I used in my different essays, and which I found less proper for the composition of this cement, they are as follow; viz. charcoal and foot, and even glass flint, whether calcined or not, potter's earth, brick, tile, slate, clay, marl, the various species of gravel or sandy stones, lime or calx, plaster, sand, oyster-shells, or any other shells when those substances are used exclusively or in too great proportions."

CENADA, an ancient town in Italy, in the marquise of Trevisana, with a bishop's see. It is 18 miles N. of Treviso. Long. 12. 26. E. Lat. 46. 2. N.

CENIS, a mountain, which is a part of the Alps, and separates the marquise of Sufa from the Morianne.

CENU, a town in South America, in Terra Firma, eight miles S. of Carthagena. Long. 75. 24. W. Lat. 10. 19. N.

CERDAGNA, a small district, partly of Spain in Catalonia, and partly of France, in the department of the Eastern Pyrenées and late province of Roussillon. Puycerda is the capital in Spain, and Mount Louis in France.

CERINTHUS, a heresiarch, contemporary with the apostles, ascribed the creation not to God, but to angels. He taught that Jesus Christ was the son of Joseph, and that circumcision ought to be retained under the gospel. He is looked upon as the head of the converted Jews, who raised in the church of Antioch the tumult of which St. Luke has given the history in the 15th chapter of the Acts. Some authors ascribe the book of the Apocalypse to Cerinthus; adding, that he put it off under the name of St. John, the better to authorise his reveries touching Christ's reign upon earth: and it is even certain that he published some works of this kind under the title of *Apocalypse*. See *APOCALYPSE*.

CERNÉE, NORTH, a village in Gloucestershire, near the Downs, where Cirencester races are run. In an adjacent field is a camp of considerable extent. It is four miles from Cricklade.

CHABLAI, a province of Savoy, bounded on the N. by the lake of Geneva, on the E. by Valais, on the S. by Faucigny, and on the W. by the republic of Geneva. Thonon is the capital.

CHABLIS, a town of France, in the department of Yonne and late province of Burgundy, remarkable for white wines. It is fifteen miles from Auxerre. Long. 3. 59. E. Lat. 47. 42. N.

CHACKTOOLE BAY, a bay in Norton Sound, discovered Vol. X.

by Captain Cook in 1778. It is exposed to S. and S.W. winds. Long. 162. 47. W. Lat. 64. 31. N.

CHAIS-DIEU, a town of France, in the department of Upper Loire and late province of Velay. Its late Benedictine abbey was much celebrated. It is twelve miles E. of Brioude. Long. 3. 4. E. Lat. 45. 15. N.

CHAMB, a town of Germany, in the circle of Bavaria, capital of a county of the same name, and seated on the river Chamb, 37 miles N.E. of Ratibon. Long. 12. 55. E. Lat. 49. 14. N.

CHAMBORT, a late royal palace in France, nine miles E. of Blois. It was built by Francis II. and from the number and trifling minuteness of its parts, has been compared to a house of cards. It stands in a park, 21 miles in circumference; but has no gardens. The style of this structure is Gothic, and it is built of free-stone. King Stanislaus resided here nine years; and it was the retreat of Marshal Saxe, who died here in 1750.

CHAMOND, a town of France, in the department of Rhone and Loire and late province of Lyonnais, with a castle, on the river Giez, seventeen miles from Lyons. Long. 4. 55. E. Lat. 45. 29. N.

CHANCH, a rich town of Egypt, five miles from Cairo, at the entrance of the desert which leads to Mount Sinai.

CHANDA, a considerable city of Berar, in the Decan of Hindoostan, subject to the chief of the eastern Mahrattas. It is seated on a branch of the Godavery, twenty miles S. of Nagpore. Long. 79. 40. E. Lat. 20. 10. N.

CHANMANNING, a city of Thibet, in Asia, which has been the residence of the grand lama. It is about 130 miles W. of Lassa. Long. 89. 45. E. Lat. 31. 0. N.

CHANNERAY, a village of Rosshire, in Scotland, near the frith of Murray, formerly a bishop's see. It is thirty miles W. of Elgin, the fine cathedral of which town is called Channey church, it having been intended, it is said, to be built here.

CHAPARANG, or **DSAPRONG**, a considerable city of Thibet in Asia, seated on the southern head of the Ganges, not far westward from the lake Manasarvar. Long. 78. 42. E. Lat. 34. 0. N.

CHARADE (*Encycl.*). The exercise of charades, if not greatly instructive, is at least innocent and amusing. At all events, as it has made its way into every fashionable circle, and has employed even Garrick, it will scarcely be deemed unworthy of attention. Indeed most that have appeared in the papers under this title, are not only destitute of pleantry, but formed in general of words utterly unfit for the purpose. They have therefore been treated with the contempt they deserved. In trifles of this nature inaccuracy is without excuse. The following examples are at least free from this blemish:

I.

My *first*, however here abused,
Designs the sex alone;
In Cambria, such is custom's pow'r,
'Tis Jenkin, John, or Joan.
My *second* oft is loudly call'd,
When men prepare to fit it:
It's name delights the female ear;
Its force, may none resist it!
It binds the weak, it binds the strong,
The wealthy, and the poor;
Still 'tis to joy a passport deem'd,
For sullied fame a cure:
It may insure an age of bliss,
Yet mis'ries oft attend it;
To fingers, ears, and noses too,
Its various lords commend it.

My whole may chance to make one drink,
Though vended in a fish-thop;
'Tis now the monarch of the seas,
And has been an archbishop.

Her- ring.

II.

My first is plowed for various reasons, and grain is frequently buried in it to little purpose. *My second*, is neither riches nor honours; yet the former would generally be given for it, and the latter is often tasteless without it. *My whole* applies equally to spring, summer, and autumn, and winter; and both fish and flesh, praise and censure, mirth and melancholy, are the better for being in it. *Sea-fan.*

III.

My first, with the most rooted antipathy to a Frenchman, prides himself, whenever they meet, upon flicking to his jacket. *My second* has many virtues, nor is it its least that it gives name to my first. *My whole*, may I never catch!

Tar-tar.

IV.

My first is one of England's prime boasts; it rejoices the ear of a horse, and anguishes the toe of a man. *My second*, when brick, is good; when stone, better; when wood, best of all. *My whole* is famous alike for rottenness and tin.

Corn-wall.

V.

My first is called bad or good,
May pleasure or offend ye;
My second, in a thirsty mood,
May very much befriend ye.
My whole, tho' styled "a cruel word,"
May yet appear a kind one;
It often may with joy be heard,
With tears may often blind one.

Fare-well.

VI.

My first is equally friendly to the thief and the lover, the roper and the student. *My second* is light's opposite: yet they are frequently seen hand in hand; and their union, if judicious, gives much pleasure. *My whole*, is tempting to the touch, grateful to the sight, fatal to the taste. *Night-jade.*

CHARCOS, Los, a province of South America, in Peru. It has the finest silver mines in the world. La Plata is the capital. See POROSI.

CHARD, a town in Somersetshire, with a market on Monday. It is seated on the side of a hill, six miles W. of Crewkerne, and 14½ W. by S. of London. Long. 3. 18. W. Lat. 50. 52. N.

CHARENTE, a department of France, which includes the late province of Angoumois. It is named from a river, which rises in Limosin, runs by Angoulême and Saintes, and falls into the bay of Biscay. Angoulême is the capital.

CHARENTE, LOWER, a department of France, which consists of the two late provinces of Anous and Saintonge. Saintes is the capital.

CHARITE, La, a town of France, in the department of Nièvre and late province of Nivernois. It stands between a hill and the Loire, over which is a stone bridge. Its situation on the road from Paris to Lyons, and the canal of Briare, has made its trade very brisk. Here are forges for converting the iron in the neighbourhood into steel, a woollen manufactory, and another for arms, helmets, pinchbeck buckles, steel buttons, and hardware in general. Here is a very pretty public walk. The suburb in which it is situated, is a kind of island, which forms about a fourth of the town. The stone bridge communicating with it was ruined by the melting of the ice in 1789. The most remarkable edifice in this town is the priory of the late Benedictine Clunites. When we consider the vast riches and prerogatives of this monastery (the prior commen-

datory of which was temporal lord of the town) we should not forget, at the same time, that, in a season of scarcity, the whole town has subsisted upon the bounty of this abbey; and hence it derives its name. It is fifteen miles N. of Nevers.

CHARITY, a term applied to certain benevolent institutions whose modes of assisting the poor are incapable of any more appropriate designation. Thus we have CHARITIES for lying-in women, for convalescents, for destitute females, &c. The following is an account of a charity for the relief of lying-in women and sick persons, at Tottenham in Middlesex.

In August 1791, eight ladies of this parish united in a plan for the relief of their poor neighbours during the time of lying-in. They began their undertaking by subscribing three shillings and sixpence each, for the purchase of linen, and afterwards appointed one of their number treasurer and manager; and in order to supply a fund for the purpose of allowing five shillings towards the payment of a midwife, and six shillings for a nurse for each patient, they agreed to contribute sixpence a-piece weekly. The plan being approved, met with encouragement, and the number of subscribers annually increased. The following statement of the number of persons annually benefited by the charity is a clear demonstration of its success and progress. There were relieved in seven years from 1791, 416 persons.

The society finding that the sick stood as much in need of assistance as lying-in women, and desirous of rendering the institution as useful as possible, determined to extend the benefit to either, without distinction; and the funds having been since considerably increased, it has been resolved to provide a large number of bags of linen; and the manager is authorised to lend them, as long as the case requires, to all sick persons who are in want, throughout the parish, where the disease is not of an infectious kind.

The following are the regulations and rules of the charity.

That a set of linen be lent to every lying-in woman, or sick person, that receives a ticket from any subscriber, for one month; such set containing one pair of sheets, twelve napkins, one bed-gown, and one shirt.—That eleven shillings be paid to such lying-in woman towards defraying the expences of a midwife and a nurse.—That the same sum be laid out for each sick person, according to their wants, either in procuring necessary food, coals, or medicines; or, at the discretion of the governors, to be paid them in a weekly allowance.—And that one of the subscribers be appointed by the rest, to preside over, and manage the affairs of the charity, liable to the control of the annual meeting of subscribers.

Every subscriber to pay three shillings and sixpence upon admission into the society, towards the purchase of linen; and afterwards to continue to pay sixpence per week, to be collected annually.—Every subscriber to receive a ticket inscribed with the name, every six months, from the governors, which such subscriber may dispose of to any object residing in the parish, whether lying-in or sick, who shall appear deserving of the bounty.—Every patient that receives a ticket shall present it to the governors, that the name may be set down for admission.—If the patient be a lying-in woman, the ticket to be returned to her; that when taken ill, she may find it to the governors for a bag of linen.—No linen to be delivered without a ticket, or previous to the woman's indisposition.—None, but married women can receive a lying-in ticket.—No woman to keep the linen longer than a month, without leave from the governors, who shall have a discretionary power of prolonging the time, in case of unusual circumstances.—Every woman to return the linen clean, and right in number.—Any woman neglecting to observe these rules, to be incapable of receiving any future benefit from the charity.—The governors is empowered to lend bags of linen to persons of good cha-

rafter, who have been disappointed of obtaining tickets, if there be a sufficient quantity to supply the patients. *This is a means of considerably extending the benefits of the institution.*—None shall receive presentations to this charity but such as reside in the parish, without regard to their being a parishioner.—There shall be an annual meeting of the subscribers on the first of May; at which time the subscriptions are to be collected.—Those who are prevented from attending personally, are requested to send their subscriptions, in order to save trouble.—It is earnestly requested, that the subscribers will be careful that the objects of their bounty do not suffer under any infectious disease.—Sick persons whose diseases are infectious, such as small-pox, fevers, &c. can only receive the appointed sum, without being assisted with linen.

The utility of this plan has already recommended it to the inhabitants of several other places. Charities similar in design, though varying in some particulars, have been established, among other places, at Cambridge, Ipswich, Colchester, Needham, Halstead, Stoke Newington, Edmonton, Cheshunt, Ware, Hertford, Woodford, Wanstead, and Walthamstow.

The most obvious advantages of this mode of administering charity, are, that the relief is bestowed at a time when it is particularly wanted, and when the occasion of that necessity disables the sufferer from earning the means of procuring a supply: that assistance is given to a great number of persons at a very small expence; for, exclusive of those who receive tickets, which entitle them to the whole benefit of the institution, the comfort of change of linen in the time of sickness is enjoyed by numbers, whose utmost frugality does not enable them to keep a sufficient stock for that purpose: and that it affords relief, but by no means precludes the necessity of industry and provident care against a day of trouble.

Nor let it be esteemed the least of its excellencies, that it induces women of superior rank to become acquainted with the temporary, as well as the habitual, distresses of their poor neighbours; that it invites them to visit those to whom they have given their tickets; and personally to inspect the abodes of poverty. If the judgment of the poor may be thought worthy of consideration, there are but few plans, upon so small a scale of expence, which afford them such an acceptable relief.

CHARITY-SCHOOLS (Encycl.). The nature of these schools in general is well known, and has been stated under *SCHOOLS*; but we conceive it to be of some importance to notice the improvements of which these seminaries have been found capable, and this will appear from the following account of the extension of the benefits of the charity-schools at Chester.

The income of the blue-coat-school at Chester had for several years been applied to the maintenance and education of thirty boys, who were admitted at nine years of age, and kept in the house for four years. This provision had proved to be extremely inadequate to its object; the greater number of the poor of that city being left entirely destitute of instruction. In 1783 the trustees adopted a beneficial extension of the charity: and in the course of that and of the ensuing year, they opened a day-school, in a wing of the hospital, for the instruction of 120 boys in reading, writing, and accounts. This they call the *green-school*, from the circumstance of each of the boys wearing a green bonnet. Two masters were engaged, one at 35l. the other at 30l. a-year; and they have proved quite equal to the care of the 120 boys. The whole expence of teaching these boys, including their bonnets, &c. is not more than eighty guineas, or 14s. a-year, each.

In order to provide for this expence, the trustees diminished the number of boys in the blue-coat-school from 30 to 25; and at the same time extended the benefit of that school to a great increase of objects, by reducing the time of continuance

to two years, and by selecting the best behaved and most deserving boys of the *green-school* for all the vacancies in the *blue-coat-school*; so that twelve or fourteen of the best boys of the former school are annually placed upon the foundation: the consequence of which is, that there is hardly any poor boy in that city, but may obtain a place in the *blue-coat-school*, if he perseveres in a course of industry and good behaviour.

This is of the greatest importance; as it extends the benefit, not only of instruction, but of (what is much more efficacious) emulation and example, to almost every lad in Chester. The boys are now admitted at nine years of age into the *green-school*; upon the nomination of the subscribers, who appoint scholars in rotation, according to the amount of their contributions to the charity. At the end of two years these boys are publicly examined for the *blue-coat-school*: after which, if their merit does not entitle them to one of the vacancies on the foundation, they remain in the *green-school* two years more; and are then dismissed at an age proper to be placed out in service. But if their progress has been such as to entitle them to a vacancy in the *blue-coat-school*, they are clothed and maintained there for two years, and at the expiration of that period, if they have made a competent progress in reading, writing, and accounts, and (in case the sea is their object) in navigation, they are placed out, with an apprentice fee of three pounds each, in handiwork, the sea-service, or in some useful trade or occupation.

Upon the former plan the funds of this charity provided, in ten years, an education for seventy-five children: in the present mode, besides the increased motives for good behaviour and attention, 362 poor children of Chester receive an education during the same period. This has been attended with no additional expence: the degree of benefit, however, far exceeds any thing that could have been attained upon the former system; for the terms of succeeding to the *blue-coat-school*, offered equally to all, supplies that stimulating incentive to human exertion, without which the best-framed establishments lose their vital principle, and degenerate into visionary and noxious theory.

Similar attention has been paid to the female children in that town. It had been ascertained by Dr. Haygarth, and some others, who were in the habit of visiting the habitations of the poor of Chester, that the girls there, as in many other towns, were extremely destitute of useful employment; and that those from nine to thirteen years of age, in one parish, three-fourths could not sew at all, and not one of them so well as to make a single article of dress. They were equally ignorant of knitting and spinning; and so unskilful in the common occupations of life, as to be disqualified for domestic servants, and for most other offices in society, and to have very few means of earning an honest livelihood.

It was calculated that four schools of forty girls each, to be taught for four years, from the age of nine to thirteen years, in addition to a school already existing for maintaining and educating eight girls, would nearly provide for all the poor girls in Chester, who were unemployed, of a proper age for instruction, and in want of charitable aid for their education. It was therefore proposed that the girls should change their school every year, and (besides their being taught to read in all the schools, and attending the parish church twice on Sunday) that they should learn in the first year to knit, in the second to spin, in the third to sew, and in the fourth to wash and get up linen; the four schools being placed near the centre of the city, so that the scholars might, without inconvenience, go each year to a different school. In this manner it was calculated that, in the whole, the education of forty-two girls would be annually completed.

The knitting, spinning, and sewing schools had, from the time of their establishment in 1787, been regularly attended; and no difficulty had occurred in supplying work for the knitters and spinners, though there had some at first as to the sewing-school. In procuring employment for the school for washing and getting up linen, there has been very great difficulty; and in consequence this part of the plan was soon given up. The schools are now reduced to two, one for knitting, the other for sewing; these are very well supplied with work, and the children continue there for two years.

On their first appearance at school, the children come in but ill clothed, and not well behaved; but, in a short time, by their industry, and by the co-operating benevolence of the ladies who visit the school, they are not only improved in behaviour, but are supplied with uniform gowns and petticoats, as well as with several other articles of dress; all their clothes, except shoes and stockings, being made at the sewing-school.

The subscriptions were at first limited to five shillings each; though, among the more opulent, several persons of the same family were admitted as subscribers. They are at present not subject to limitation; and liberal donations have been made for supplying books, wheels, forms, and for other expences. A considerable benefit has accrued from connecting these girl-schools in some degree with the Sunday-schools of Chester:—for, as an encouragement to good behaviour, the most deserving girls in the Sunday-schools are regularly elected into the working-schools. This has a powerful and extensive effect in improving the morals and behaviour of all the girls in the Sunday-schools, and with them of almost all the female children in Chester.

It is not an unreasonable or unfounded presumption, that the extension of the schools at Chester will operate to improve the rising generation, in skill, industry, honesty, economy, sobriety, and in all those virtues which result from a proper and religious education, and which can contribute to an useful and happy life.—There are very few of these virtues that do not principally depend on education, and on the seeds sown in the mind during the early period of life. A very able writer has observed, that “drunkenness is the vice of an uncultivated mind:” and, in truth, with very few exceptions, this vice, in all its beastly deformity, will be found to be most prevalent among the ignorant and uninformed; among those who have had no means of improving or appreciating their faculties, and who, in respect of mental and moral improvement, can be placed but little above the brute creation.

In all those moral virtues, which are of such inestimable value through life—of industry and skill we say nothing, for it is obvious that industry and habit are their vital principle;—but in moral virtues, in fidelity, truth, justice, and integrity, every attainment is casual and accidental, all improvement deceitful and uncertain, except that which originates in principle, and whose basis firmly rests on the sure ground of a religious education.

The absurd prejudices that have existed against extending the common and general benefits of education to the children of the poor, and the extraordinary supposition, that an uneducated and neglected boy will prove an honest and useful man,—that a youth of ignorance and idleness will produce a mature age of industry and virtue,—are now in great measure exploded. Switzerland, and Scotland, and the northern counties of England, where the education and occupation of youth are particularly attended to, afford very gratifying evidence of the contrary position. The individuals of those counties are not only more industrious and more thriving, but, of all parts of Europe, peculiarly exempt from criminal habits.

If the revenues of all our charity-schools were applied as advantageously as those of the blue-coat-school, and the other

schools at Chester, it is probable that the funds would be sufficient to give to every individual in England, the same advantages of early instruction and good habits, as are enjoyed by our northern neighbours, and by the inhabitants of Switzerland. In order to produce this effect, some existing prejudices against removing ancient abuses, and (we are sorry to add) some degree of interest or patronage in the continuance of those abuses, must be given up; and the enquiry must be fairly and impartially entered into, how the good effects of every charity may be best attained, and most widely extended, without injustice to its original objects. There is hardly any charitable fund in England to which the example of Chester may not in some degree apply, and by the application of which, children may not be enabled to acquire those early and principal habits of life, without which wealth and power (and even liberty itself) are to the possessors of but little value; too frequently the source of ungoverned passions and criminal habits; pernicious at the same time to other members of society, and destructive to the welfare and existence of the community.

CHARLES-LE-GROS, emperor of the West in 881, king of Italy and Suabia, memorable for his reverse of fortune; being dethroned at a diet held near Mentz, by the French, the Italians, and the Germans, in 887: after which he was obliged to subsist on the bounty of the archbishop of Mentz. He died in 888.

CHARLES V. (emperor and king of Spain), was son of Philip I. archduke of Austria, and of Jane queen of Castile. He was born at Ghent, February 24, 1500, and succeeded to the crown of Spain in 1517. Two years afterwards he was chosen emperor at Frankfurt after the death of Maximilian his grandfather. He was a great warrior and politician: and his ambition was not satisfied with the kingdoms and provinces he possessed; for he is supplied, with reason, to have aspired at universal empire. He is said to have fought 66 battles, in most of which he was victorious. He took the king of France (Francis I.) prisoner, and sold him his liberty on very hard terms: yet afterwards, when the people of Ghent revolted, he asked leave to pass through his dominions; and though the generous king thus had him in his power, and had an opportunity of revenging his ill-treatment, yet he received and attended him with all pomp and magnificence. He sacked Rome, and took the Pope prisoner; and the cruelties which his army exercised there are said to have exceeded those of the northern barbarians. Yet the pious emperor went into mourning on account of this conquest; forbade the ringing of bells; commanded processions to be made, and prayers to be offered up, for the deliverance of the Pope his prisoner; yet did not inflict the least punishment on those who treated the holy father and the holy see with such inhumanity. He is accused by some Romish writers of favouring Lutheran principles, which he might easily have extirpated. But the truth is, he found his account in the divisions which that sect occasioned; and he for ever made an advantage of them, sometimes against the Pope, sometimes against France, and at other times against the empire itself. He was a great traveller, and made 50 different journeys into Germany, Spain, Italy, Flanders, France, England, and Africa. Though he had been successful in many unjust enterprises, yet his last attempt on Metz, which he besieged with an army of 100,000 men, was very just and very unsuccessful.

Victed at the reverse of fortune, which seemed to attend his latter days, and oppressed by sickness, which unfitted him any longer for holding the reins of government with steadiness, or to guide him with address, he resigned his dominions to his brother Ferdinand and his son Philip; and retreated to the monastery of St. Justus, near Placentia, in Estremadura.

When Charles entered this retreat, he formed such a plan of life for himself as would have suited a private gentleman of moderate fortune. His table was neat, but plain; his domesticities few; his intercourse with them familiar; all the cumbersome and ceremonious forms of attendance on his person were entirely abolished, as destructive of that social ease and tranquillity which he courted in order to sooth the remainder of his days. As the mildness of the climate, together with his delivery from the burdens and cares of government, procured him at first a considerable remission from the acute pains of the gout, with which he had been long tormented, he enjoyed, perhaps, more complete satisfaction in this humble solitude than all his grandeur had ever yielded him. The ambitious thoughts and projects which had so long engrossed and disquieted him, were quite effaced from his mind. Far from taking any part in the political transactions of the princes of Europe, he restrained his curiosity even from an enquiry concerning them; and he seemed to view the busy scene which he had abandoned with all the contempt and indifference arising from his thorough experience of its vanity, as well as from the pleasing reflection of having disentangled himself from its cares.

Other amusements, and other objects, now occupied him. Sometimes he cultivated the plants in his garden with his own hands; sometimes he rode out to the neighbouring wood on a little horse, the only one that he kept, attended by a single servant on foot. When his infirmities confined him to his apartment, which often happened, and deprived him of these more active recreations, he either admitted a few gentlemen, who resided near the monastery, to visit him, and entertained them familiarly at his table; or he employed himself in studying mechanical principles, and in forming curious works of mechanism, of which he had always been remarkably fond, and to which his genius was peculiarly turned. With this view he had engaged Turriano, one of the most ingenious artists of that age, to accompany him in his retreat. He laboured together with him in framing models of the most useful machines, as well as in making experiments with regard to their respective powers; and it was not seldom that the ideas of the monarch assisted or perfected the inventions of the artist. He relieved his mind at intervals with slighter and more fantastic works of mechanism, in fashioning puppets, which, by the structure of internal springs, mimicked the gestures and actions of men, to the no small astonishment of the ignorant monks, who, beholding movements which they could not comprehend, sometimes distrusted their own senses, and sometimes suspected Charles and Turriano of being in compact with invisible powers. He was particularly curious with regard to the construction of clocks and watches; and having found, after repeated trials, that he could not bring any two of them to go exactly alike, he reflected, it is said, with a mixture of surprise as well as regret on his own folly, in having bestowed so much time and labour in the more vain attempt of bringing mankind to a precise uniformity of sentiment concerning the intricate and mysterious doctrines of religion.

But in what manner soever Charles disposed of the rest of his time, he constantly reserved a considerable portion of it for religious exercises. He regularly attended divine service in the chapel of the monastery every morning and evening; he took great pleasure in reading books of devotion, particularly the works of St. Augustine and St. Bernard; and conversed much with his confessor, and the prior of the monastery, on pious subjects. Thus did Charles pass the first year of his retreat in a manner not unbecoming a man perfectly disengaged from the affairs of this present life, and standing on the confines of a future world, either in innocent amusements

which soothed his pains, and relieved a mind worn out with excessive application to business; or in devout occupations, which he deemed necessary in preparing for another state.

But, about six months before his death, the gout, after a longer intermission than usual, returned with a proportional increase of violence. His shattered constitution had not strength enough remaining to withstand such a shock. It enfeebled his mind as much as his body; and from this period we hardly discern any traces of that sound and masculine understanding which distinguished Charles among his contemporaries. An illiberal and timid superstition depressed his spirit. He had no relish for amusements of any kind. He endeavoured to conform, in his manner of living, to all the rigour of monastic austerity. He desired no other society than that of monks, and was almost continually employed in chanting with them the hymns of the missal. As an expiation for his sins, he gave himself the discipline in secret with such severity, that the whip of cords which he employed as the instrument of his punishment, was found, after his decease, tinged with his blood. Nor was he satisfied with these acts of mortification, which, however severe, were not unexampled. The timorous and distrustful solicitude which always accompanies superstition, still continued to disquiet him, and depreciating all that he had done, prompted him to aim at something extraordinary, at some new and singular act of piety that would display his zeal, and merit the favour of Heaven. The act on which he fixed was as wild and uncommon as any that superstition ever suggested to a disordered fancy. He resolved to celebrate his own obsequies before his death. He ordered his tomb to be erected in the chapel of the monastery. His domestics marched thither in funeral procession, with black tapers in their hands. He himself followed in his shroud. He was laid in his coffin with much solemnity. The service for the dead was chanted; and Charles joined in the prayers which were offered up for the rest of his soul, mingled his tears with those which his attendants shed, as if they had been celebrating a real funeral. The ceremony, clothed with sprinkling holy water on the coffin in the usual form, and, all the assistants retiring, the doors of the chapel were shut. Then Charles rose out of the coffin and withdrew to his apartment, full of those awful sentiments which such a singular solemnity was calculated to inspire. But either the fatiguing length of the ceremony, or the impression which this image of death left on his mind; affected him so much, that next day he was seized with a fever. His feeble frame could not long resist its violence; and he expired on the 21st of September, after a life of 58 years six months and 21 days.

CHARLES XII. King of Sweden, was born in 1682. By his father's will, the administration was lodged in the hands of the Queen-dowager Eleonora with five senators, till the young prince was 18: but he was declared major at 15, by the states convened at Stockholm. The beginning of his administration raised no favourable ideas of him, as he was thought both by Swedes and foreigners to be a person of mean capacity. But the difficulties that gathered round him, soon afforded him an opportunity to display his real character. Three powerful princes, Frederic king of Denmark, Augustus king of Poland and elector of Saxony, and Peter the Great, czar of Muscovy, presuming on his youth, conspired his ruin almost at the same instant. Their measures alarmed the council, they were for diverting the storm by negotiations; but Charles, with a grave resolution that astonished them, said, "I am resolved never to enter upon an unjust war, nor to put an end to a just one but by the destruction of my enemies. My resolution is fixed: I will attack the first who shall declare against me; and when I have conquered him, I

may hope to strike a terror into the rest." The old counsellors received his orders with admiration; and were still more surprised when they saw him on a sudden renounce all the enjoyments of a court, reduce his table to the utmost frugality, dressed like a common soldier, and, full of the ideas of Alexander and Cæsar, propose those two conquerors for his models in every thing but their vices. The King of Denmark began by ravaging the territories of the Duke of Holstein. Upon this, Charles carried the war into the heart of Denmark; and made such a progress, that the King of Denmark thought it best to accept of peace, which was concluded in 1700. He next resolved to advance against the King of Poland, who had blocked up Riga. He had no sooner given orders for his troops to go into winter-quarters, than he received advice, that Narva, where Count Horne was governor, was besieged by an army of 100,000 Muscovites. This made him alter his measures, and move towards the czar; and at Narva he gained a surprising victory, which cost him not above 2000 men killed and wounded. The Muscovites were forced to retire from the provinces they had invaded. He pursued his conquests till he penetrated as far as where the diet of Poland were sitting; when he made them declare the throne of Poland vacant, and elected Stanislaus their king: then making himself master of Saxony, he obliged Augustus himself to renounce the crown of Poland, and acknowledge Stanislaus by a letter of congratulation on his accession. All Europe was surprised with the expeditions finishing of this great negotiation, but more at the disinterestedness of the King of Sweden, who satisfied himself with the bare reputation of this victory, without demanding an inch of ground for enlarging his dominions. After thus reducing the King of Denmark to peace, placing a new king on the throne of Poland, having humbled the Emperor of Germany, and protected the Lutheran religion, Charles prepared to penetrate into Muscovy in order to dethrone the czar. He quickly obliged the Muscovites to abandon Poland, pursued them into their own country, and won several battles over them. The czar, disposed to peace, ventured to make some proposals; Charles only answered, "I will treat with the czar at Muscovy." When this haughty answer was brought to Peter, he said, "My brother Charles still affects to act the Alexander, but I flatter myself he will not in me find a Darius." The event justified him: for the Muscovites, already beaten into discipline, and under a prince of such talents as Peter, entirely destroyed the Swedish army at the memorable battle of Pultowa, July 8, 1709; on which decisive day Charles lost the fruits of nine years' labour, and of almost 100 battles! The king, with a small troop, pursued by the Muscovites, passed the Borithenes to Oczakow in the Turkish territories; and from thence, through desert countries, arrived at Bender; where the Sultan, when informed of his arrival, sent orders for accommodating him in the best manner, and appointed him a guard. Near Bender, Charles built a house, and intrenched himself; and had with him 1800 men, who were all clothed and fed, with their horses, at the expence of the grand-signior. Here he formed a design of turning the Ottoman arms upon his enemies; and is said to have had a promise from the vizier of being sent into Muscovy with 200,000 men. While he remained here, he insensibly acquired a taste for books: he read the tragedies of Corneille and Racine; with the works of Despreaux, whose fables he relished, but did not much admire his other works. When he read that passage in which the author represents Alexander as a fool and a madman, he tore out the leaf. He would sometimes play at chess: but when he recovered of his wound, he renewed the fatigues in exercising his men; he tired three

horses a-day; and those who courted his favour were all day in their boots. To dispose the Ottoman Porte to this war, he detached about 800 Poles and Cossacks of his retinue, with orders to pass the Neiffer, that runs by Bender, and to observe what passed on the frontiers of Poland. The Muscovite troops, dispersed in those quarters, fell immediately upon this little company, and pursued them even to the territories of the grand-signior. This was what the king expected. His ministers at the Porte excited the Turks to vengeance; but the Czar's money removed all difficulties, and Charles found himself in a manner prisoner among the Tartars. He imagined the sultan was ignorant of the intrigues of his grand-vizier. Poniatowsky undertook to make his complaints to the grand-vizier. The sultan, in answer, some days after, sent Charles five Arabian horses, one of which was covered with a saddle and housing of great riches; with an obliging letter, but conceived in such general terms as gave reason to suspect that the minister had done nothing without the sultan's consent: Charles, therefore, refused them. Poniatowsky had the courage to form a design of deposing the grand-vizier; who accordingly was deprived of his dignity and wealth, and banished. The seal of the empire was given to Numan Cuproughly; who persuaded his master that the law forbade him to invade the czar, who had done him no injury; but to succour the King of Sweden as an unfortunate prince in his dominions. He sent his majesty 800 purples, every one of which amounted to 500 crowns, and advised him to return peaceably to his own dominions. Charles rejected this advice, threatening to hang up the bashaws, and shave the beards of any Janissaries who brought him such messages; and sent word that he should depend upon the grand-signior's promise, and hoped to reconquer Poland as a conqueror with an army of Turks. After various intrigues at the Porte, an order was sent to attack this head of iron, as he was called, and to take him either alive or dead. He stood a siege in this house, with forty domestics, against the Turkish army; killed no less than 20 Janissaries with his own hand; and performed prodigies of valour on a very unnecessary and unwarrantable occasion. But the house being set on fire, and himself wounded, he was at last taken prisoner and sent to Adrianople; where the grand-signior gave him audience, and promised to make good all the damages he had sustained. At last, after a stay of above five years, he left Turkey; and, having disguised himself, travelled Wallachia, Transylvania, Hungary, and Germany, attended only by one person; and in 16 days' riding, during which time he never went to bed, came to Stralsund at midnight, November 21, 1714. His boots were cut from his swollen legs, and he was put to bed; where, when he had slept some hours, the first thing he did was to review his troops, and examine the state of the fortifications. He sent out orders that very day, to renew the war with more vigour than ever. But affairs were now much changed: Augustus had recovered the throne of Poland; Sweden had lost many of its provinces; and was without money, trade, credit, or troops. The kings of Denmark and Prussia seized the island of Rugen; and besieged him in Stralsund, which surrendered; but Charles escaped to Carlscroon. When his country was threatened with invasion by so many princes, he, to the surprise of all Europe, marched into Norway with 20,000 men. A very few Danes might have stopped the Swedish army; but such a quick invasion they could not foresee. Europe was yet more at a loss to find the czar so quiet, and not making a descent upon Sweden, as he had before agreed with his allies. This inaction was the consequence of one of the greatest designs, and at the same time the most difficult, of any that were ever formed by the imagination of man. In short, a scheme was set on foot for a reconciliation with the

czar; for replacing Stanislaus on the throne of Poland; and setting James the Second's son upon that of England, beside restoring the Duke of Holstein to his dominions. Charles was pleased with these grand ideas, though without building much upon them, and gave his minister leave to act at large. In the mean time, Charles was going to make a second attempt upon Norway in 1718; and he flattered himself with being master of that kingdom in six months; but he was killed at Frederichshall, a place of great strength and importance, which is reckoned to be the key of that kingdom, as he was examining the works.—This prince experienced the extremes of prosperity and of adversity, without being softened by the one, or disturbed for a moment at the other; but was a man rather extraordinary than great, and fitter to be admired than imitated. He was honoured by the Turks for his rigid abstinence from wine, and his regularity in attending public devotion. In religion he was a Lutheran, and a strong believer in predestination. He wrote some observations on war, and on his own campaigns from 1700 to 1709; but the MS. was lost at the unfortunate battle of Pulstowa.

CHARLES CAPE, a promontory of N. America, on the S.W. part of the strait entering into Hudson's Bay. Long. 75. 15. W. Lat. 62. 10 N.

CHARLTON, a village in Kent, on the edge of Blackheath, on the bow of an eminence that commands a fine view of the Thames. It is famous for an annual fair held here on St. Luke's day; it is called Horn Fair; horn wares of all kinds are sold; the mob wear horns on their heads; and all that licentiousness prevails which its name imports. Tradition traces the origin of this fair to the time of King John, who, being detected in an amour here, was obliged, it is said, to purchase his safety of the injured husband, by a grant of all the land from this place to Cuckold's Point; and he established the fair as the tenure. In this parish, on Blackheath, is Morden College, a noble institution for decayed merchants, founded by Sir John Morden, Bart. a Turkey merchant, several years before his death, which happened in 1708.

CHARLEVILLE, a borough of Ireland, in the county of Cork, 30 miles N. of Cork. Long. 8. 30. W. Lat. 52. 23. N.

CHARLEVILLE, a handsome town of France, in the department of the Ardennes and late province of Champagne. The streets are straight, and the houses of an equal height. Here is a magnificent square, and in the centre a handsome fountain. It is seated on the Moselle, near Mezieres, from which it is separated by a bridge and a causeway; 15 miles N.W. of Sedan, and 115 N.E. of Paris. Long. 4. 45. E. Lat. 49. 50. N.

CHARLEY, a town of Lancashire, with a market on Tuesday. It is seated near the spring-head of a rivulet called Chor, not far from the river Yarrow; six miles S.E. of Preston, and 203 N.W. of London. Long. 2. 45. W. Lat. 53. 38. N.

CHARMES, a town of France, in the department of the Vosges, and late province of Lorraine, seated on the Moselle, over which is a handsome bridge. It is eight miles E. of Mirecourt. Long. 6. 17. E. Lat. 48. 21. N.

CHARNWOOD, or CHARLEY FOREST, a rough open tract in the N.W. part of Leicestershire, and in the neighbourhood of Bardons Hills.

CHAROLLES, a town of France, in the department of Saône and Loire. It has a ruinous castle, and is seated on the river Reconc, 24 miles W.N.W. of Macon. Long. 4. 24. E. Lat. 46. 28. N.

CHASE, or CHACE, is also a place of retreat for deer and wild beasts (*Encycl.*). The following history of the English

chases is given by Mr. Pennant: "At first the beasts of chase had this whole island for their range; they knew no other limits than the ocean, nor confessed any particular master. When the Saxons had established themselves in the heptarchy, they were referred by each sovereign for his own particular diversion: hunting and war, in those uncivilized ages, were the only employ of the great; their active, but uncultivated minds, being susceptible of no pleasures but those of a violent kind, such as gave exercise to their bodies, and prevented the pain of thinking.

"But as the Saxon kings only appropriated those lands to the use of forests which were unoccupied, so no individuals received any injury: but when the conquest had settled the Norman line on the throne, this passion for the chase was carried to an excess, which involved every civil right in a general ruin: it superseded the consideration of religion even in a superstitious age: the village-communities, nay even the most sacred edifices, were turned into one vast waste, to make room for animals, the objects of a lawless tyrant's pleasure. The new forest in Hampshire is too trite an instance to be dwelt on; fugiatory laws were enacted to preserve the game; and in the reigns of William Rufus, and Henry I. it was less criminal to destroy one of the human species than a beast of chase. Thus it continued while the Norman line filled the throne; but when the Saxon line was restored under Henry II. the rigour of the forest laws was immediately softened.

"When our barons began to form a power, they claimed a vast, but more limited, tract for a diversion that the English were always fond of. They were very jealous of any encroachments on their respective bounds, which were often the cause of deadly feuds: such a one gave cause to the fatal day of *chevy-chace*; a fact which, though recorded only in a ballad, may, from what we know of the manners of the times, be founded on truth: not that it was attended with all the circumstances which the author of that natural but heroic composition hath given it; for, on that day, neither a *Percy* nor a *Douglas* fell: here the poet seems to have claimed his privilege, and mixed with this fray some of the events of the battle of *Otterbourne*.

"When property became happily more divided by the relaxation of the feudal tenures, these extensive hunting-grounds became more limited; and as tillage and husbandry increased, the beasts of chase were obliged to give way to others more useful to the community. The vast tracts of land, before dedicated to hunting, were then contracted; and, in proportion as the useful arts gained ground, either lost their original destination, or gave rise to the invention of *parks*. Liberty and the arts seem coeval; for when once the latter got footing, the former protected the labours of the industrious from being ruined by the licentious sportsman, or being devoured by the objects of his diversion: for this reason, the subjects of a despotic government still experience the inconveniences of vast wastes, and forests, the terrors of the neighbouring husbandmen; while in our well-regulated monarchy very few chases remain. The English still indulge themselves in the pleasures of hunting; but confine the deer-kind to parks, of which England boasts of more than any other kingdom in Europe. The laws allow every man his pleasure; but confine them in such bounds as prevents them from being injurious to the means of the community. Before the Reformation, the prelates seem to have guarded sufficiently against this want of amusement, the see of Norwich, in particular, being possessed, about that time, of thirteen parks.

CHATEL-CHALONS (*Encycl.*), erroneously spelt CHATEL-CHALLONS.

CHATHILLON-LES-COMBES, a town in the department of Ain and late province of Bresse, twelve miles W. of Bourg.

CHATILLON-SUR-INDRE, a town of France, in the department of Indre and late province of Berry, ten miles S. of Loches. Long. 0. 55. E. Lat. 47. 22. N.

CHATILLON-SUR-MARNE, a town of France, in the department of Marne and late province of Champagne, seventeen miles S. of Rheims. Long. 4. 5. E. Lat. 48. 58. N.

CHATOQUE, LAKE, a lake of North America, in the state of New York. It is the source of the river Conawongo, which runs into the Alleghany. The lower end of it, whence the river proceeds, is in lat. 42. 10. N. From the N.W. of this lake to Lake Erie is nine miles.

CHATTESWORTH, a village in Derbyshire, near the river Derwent, in the Peak, and reckoned one of its wonders. Here is the magnificent seat of the Duke of Devonshire. It is six miles from Chesterfield.

CHAUMONT, a town of France, in the department of Oise and late province of the Isle of France, thirty miles N.W. of Paris. Long. 2. 7. E. Lat. 49. 18. N.

CHEADLE, a town in Staffordshire, with a market on Saturday. It is seated in the most fertile part of the moorlands, twelve miles N.E. of Stafford. Long. 1. 56. W. Lat. 53. 0. N.

CHEAM, a village in Surrey; of which it is remarkable, that, between the years 1581 and 1624, of six of its rectors successively, five became bishops. Adjoining to this parish, is the site of the village of Cudington, or Cudington, near which Henry VIII. built the palace of Nonfuch, so much celebrated, by Camden and Hentzner, for its magnificence. It was a favourite residence of Queen Elizabeth; but being granted by Charles II. to the Dukes of Cleveland, the pulled down the house, and disparted the land. Cheam is thirteen miles S. by W. of London.

CHEBUKTO HARBOUR, in North America, near Halifax, in Nova Scotia. Long. 63. 18. W. Lat. 44. 45. N.

CHEDDER, a large village of Somersetshire, famous for its cheeses, which are the next best to Stilton cheese in England, and as large as those of Cheshire. It is three miles E. of Axbridge. Long. 2. 57. W. Lat. 51. 13. N.

CHEDWORTH, a village of Gloucestershire, four miles S.W. of North Leach, through which the river Coln runs to Fairford. It is situated on the declivity of two hills. In this parish, in 1760, a Roman bath was discovered. The Roman Fosse lies about two miles N.W. of this spot. There is a tumulus on a hill near this bath, with a remarkably large stone set upright on the top of it, on the removal of which great quantities of human bones were discovered.

CHEESE (*Encycl.*). Every country has places noted for this commodity: thus Cheshire and Gloucester cheese are famous in England; and the Parmesan cheese is in no less repute abroad, especially in France. This sort of cheese is entirely made of sweet cow-milk: but at Rochefort in Languedoc, they make it of ewes' milk; and in other places it is usual to add goats' or ewes' milk in a certain proportion to that of the cow. Parmesan is made in cheeses of 60, 80, 100, and even 180 pounds weight; the size depends on the number of cows in the possession of the farmer: those which weigh 60 or 80 pounds are considered most commodious for sale.

In warm weather, and when there is plenty of milk, they make cheese every day: in winter the milk will keep, and the cheese is only made every other day. In summer, the evening's milk is skimmed the next morning, that of the morning at about three o'clock in the afternoon, when the evening's milk is skimmed again, both are mixed together, and the farmer immediately proceeds to manufacture his cheese.

All the milk intended for one boiling is put together in a large copper cauldron, large enough to contain 1000 pounds, three feet five inches deep, and nearly of the form described

in the figure. The cauldron is suspended by its handle on a wooden crane, so that it can be taken from the fire and replaced at pleasure. The fire-place forms a kind of stove, between which and the cauldron the flame blazes freely; but the stove is open on one side, to leave a passage for the cauldron when it becomes necessary to turn it. The hearth, and even the bottom of the cauldron, are below the level of the earth, that the person employed in making the cheese may with ease plunge his hands when necessary to the very bottom.

When the milk is in the cauldron, the fire is kindled, the milk is heated to the temperature of about forty degrees, and kept stirring from the top to the bottom, in order that the temperature may be equally distributed through all parts of the mass. While the milk is thus heating, the cream is churned into butter.

When the milk has attained the proper temperature, the cauldron is removed from the fire, and a large wooden skreen is placed for the purpose of preventing the milk from receiving any further heat from the fire, and that no motion may be created by it in any part of the mass. They then wait five or six minutes to afford time for the calming of any internal motion, occasioned by the different temperatures of the several strata of milk; and when the whole is in a state of calm, the rennet is infused in the following manner.

They have, in a little vessel, a leaven; composed of milk curdled in the stomach of a calf, wheat-flour, and salt, all fermented together. Of this they take a small lump, about the size of a walnut, and tie it up in the corner of a napkin, which is plunged into the milk and squeezed out with the hand. The linen retains, like a sieve, all the substances in the rennet which will not dissolve; and when these substances only are left, the napkin is withdrawn, and the milk well stirred that the rennet may be equally distributed; that done, the whole mass is left to curdle without disturbance. In this interval they finish churning the butter.

In three quarters of an hour, or an hour, the milk is curdled, which is made apparent when, on taking up some of it with a wooden spoon, at different places in the surface, it is perceived to have lost its fluidity. Then they take away the skreen, and replace the cauldron on the fire, to heat the milk anew, and carry its temperature to fifty degrees. The motive for this second heating is, to facilitate the separation of the curd, as hereafter mentioned. During the time it is on the fire it is kept continually stirring, for the purpose of dividing it. The kind of boiling which it now undergoes renders the curd more dense, and increases its specific weight. They then let it cool a little, and take away about a quarter of the thin milk, that the remainder may with less difficulty acquire the temperature of fifty degrees. They then keep stirring it continually, that all the curd may be divided into very small lumps. When the proper temperature is attained, they throw in a few pinches of saffron, for the mere purpose of colouring the cheese.

At this period the operation becomes extremely critical. The heating not only enables the masses of curd to adhere to each other, in the same manner as it hardens the white of eggs, but it enables the curd to separate itself from the milk after the mass is formed. It is probable that there is a nice limitation to be observed in this respect, which must not be exceeded, for the person employed in making of the cheese now frequently takes up handfuls of the curd, which he squeezes strongly together to ascertain whether it has acquired a proper consistency. When he is satisfied in this respect, the cauldron is again withdrawn from the fire, and the skreen replaced, or the fire is extinguished with water.

When the mass is no longer stirred, the curd soon precipitates itself. Then with large wooden vessels they take out

almost all the thin milk, and throw over the rest about two pailfuls of cold water, to decrease the heat, and permit the workman to thrust in his hands. Then, holding by his thighs to the brim of the vessel, he bends himself in, to reach the bottom with his hands; he quickly gathers all the curd together to one side of the cauldron, and passes a cloth under the curd, which he gathers together, grasping the four corners of the cloth. This mass is very heavy, and he could not draw it out immediately, but the assistants pour into the cauldron the milk they had previously taken out, and this enables him to raise, without much difficulty, the mass of curd to the surface. He then carries it away in the cloth, and places it in a round wooden form, without bottom, standing on an even solid table.

All this operation requires great readiness in the service, and even a great degree of habit; for the power of adhesion which the curd has acquired makes it harden speedily, and if it were permitted to assume a bad shape it would never afterwards lose it.

When the curd is placed in the form, the cheese has already acquired firmness, and will resist a strong pressure of the finger; it hardens very rapidly, and, without any external compression, squeezes out, by its own power of contraction, the greater part of the thin milk which is yet contained in it. The effect of this faculty would be to give the cheese a spherical form; but to flatten it at the ends, they place over it a round plate of wood, and a heavy stone. Thus it is left for the night; it cools, throws off the thin milk, and assumes the form it is intended to retain.

On the morrow they place a layer of salt on one of the flat sides of the cheese; the next day they turn it, and salt the opposite surface; and continue this alternate operation for forty days, when the salt will melt no longer. The use of this operation is not only to salt but to dry the cheese, that is, to extract from it all the milk which may have remained after the cheese had become cool, and could no longer contract itself.

When, after about forty days, the cheese has acquired the necessary qualities for keeping and sale, they scrape it with a flexible knife to take off the little soft incrustation on the surface, so that the soft cheese is seen on every side; the surface is then perfectly sleek, and they varnish it with a slight layer of linseed-oil; finally, they give to the convex surface only a red tint, made from vegetable substances alone, and the cheese is fit for sale.

The thin milk which has been replaced in the cauldron still contains a considerable quantity of curd, and even some ferous parts, which, though they did not curdle at first, ought not to be lost. The cauldron is replaced on the fire, and fresh rennet put into the milk; by these means a sufficient quantity of curd is obtained to make an inferior sort of cheese for family consumption. The milk which still remains serves to feed the live stock. See plate 20.

CHEESE-*Rennet*. See GALLIUM.

CHEIRANTHUS, STOCK-GILLIFLOWER, or *Wallflower*; a genus of the filiquosa order, belonging to the tetradynamia class of plants. The species are thirteen, but the following three are most worthy of notice: 1. The *cheiri* or common wallflower, with ligneous, long, rough roots; an upright, woody, abiding stalk, divided into many erect angular branches, forming a bushy head from one to two feet high, closely garnished with spear-shaped, acute, smooth leaves, and all the branches terminating in long erect spikes of numerous flowers, which in different varieties are yellow, bloody, white, &c. 2. The *incanus*, or hoary cheiranthus, with ligneous, long, naked, white roots; and upright, strong, woody, abiding

stem, from one to three feet high, branchy at top, adorned with long, spear-shaped, obtuse, hoary leaves; and the top of the stalk and all the branches terminated by erect spikes of flowers from one to two or three feet long, of different colours in different varieties. 3. The *annuus*, or ten-weeks-stock, with an upright, woody, smooth stalk, divided into a branchy head, twelve or fifteen inches high, garnished with spear-shaped, blunt, hoary leaves, a little indented, and all the branches terminated by long erect spikes of numerous flowers of different colours in different varieties.—The two first sorts are very hardy evergreen biennials or perennials; but the last is an annual plant, so must be continued by seed sown every year; and even the two first, notwithstanding their being perennial, degenerate so much in their flowers after the first year, that it will be proper also to raise an annual supply of them. The seeds are to be sowed only from the plants with single flowers; for the double ones bring no seeds to perfection. The seeds are to be chosen from such flowers as have five, six, or more petals, or from such as grow near to the double ones. They may be sown in the full ground in the spring, and may be afterwards transplanted. When fine doubles of the two first kinds are obtained, they may be multiplied by slips from the old plants.

CHEITORE, or OUDIPOUR, one of the principal of the Rajpoot states, in Hindoostan Proper. It consists, in general, of high mountains, divided by narrow valleys; or of plains environed by mountains, accessible only by narrow passes or defiles: in reality, one of the strongest countries in the world; yet having an extent of arable land sufficient for the support of a numerous population, and blessed with a mild climate, being between the 24th and 28th degrees of N. latitude: in fine, a country likely to remain for ever in the hands of its present possessors, and to prove the asylum of the Hindoo religion and customs. "Notwithstanding," says Major Rennell, "the attacks that have been made upon it by the Gaznavide, Pattan, and Mogul emperors, it has never been more than nominally reduced. Some of the fortresses, with which the country abounds, were indeed taken: but the spirit of independent nations does not reside in fortresses, nor are they to be conquered with them. Accordingly, every war on these people, even by Aurungzebe, ended in a compromise, or defeat, on the side of the assailants." The country, however, is now tributary to the Mahrattas.

CHEITORE, or Oudipour, a town, in a province of the same name, in Hindoostan Proper. It was the capital of the Rana, or chief prince of the Rajpoots, in the days of his greatness; and was a fortress and city of great extent, situated on a mountain; but it has been in ruins since the time of Aurungzebe in 1681. It is 120 miles S. by E. of Nagpore. Long. 74. 56. E. Lat. 25. 21. N.

CHEKAU, in natural history, the name of an earth found in many parts of the East Indies, and sometimes used by the Chinese in their porcelain manufactures. It is a hard and stony earth; and the manner of using it is this: they first calcine it in an open furnace, and then beat it to a fine powder. This powder they mix with large quantities of water: then stirring the whole together, they let the coarser part subside; and pouring off the rest yet thick as cream, they leave it to settle, and use the matter which is found at the bottom in form of a soft paste, and will retain that humidity a long time. This supplies the place of the earth called *hoache*, in the making of that elegant sort of china-ware which is all white, and has flowers which seem formed by a mere vapour within its surface. The manner of their using it is this: they first make the vessel of the common matter of the manufacture; when this is almost dry, they

paint upon it the flowers, or whatever other figures they please, with a pencil dipt in this preparation of the chekao; when this is thoroughly dry, they cover the whole vessel with the varnish in the common way, and bake it as usual. The consequence is, that the whole is white: but the body of the vessel, the figures, and the varnish, being three different substances, each has its own particular white; and the flowers being painted in the finest white of all, are distinctly seen through the varnish upon the vessel, and seem as if traced by a vapour only. The hoache does this as well as the chekao; and has besides this the quality of serving for making the porcelain ware either alone, or in the place of kaolin: the chekao has not this property, nor any other substance besides this hoache, which appears to be the same with our steatites or soap-rock.

CHEKE (Sir John), a celebrated statesman, grammarian, and divine, of an ancient family in the Isle of Wight, was born at Cambridge in the year 1524, and educated at St. John's College in that university; where, after taking his degrees in arts, he was first chosen Greek lecturer, and in 1540 professor of that language, with a stipend of 40*l.* a-year. In this station he was principally instrumental in reforming the pronunciation of the Greek language, which, having been much neglected, was imperfectly understood. About the year 1543 he was incorporated master of arts at Oxford, where, we are told, he had studied for some time. In the following year he was sent to the court of King Henry VIII. and appointed tutor for the Latin language, jointly with Sir Anthony Cooke, to Prince Edward, about which time he was made canon of the college newly founded in Oxford; wherefore he must have now been in orders. On the accession of his royal pupil to the crown, Mr. Cheke was first rewarded with a pension of 100 marks, and afterwards obtained several considerable grants from the crown. In 1550 he was made chief gentleman of the privy-chamber, and was knighted the following year; in 1552, chamberlain of the exchequer for life; in 1553, clerk of the council; and soon after secretary of state and privy-counsellor. But these honours were of short duration. Having concurred in the measures of the Duke of Northumberland for settling the crown on the unfortunate Jane Grey, and acted as her secretary during the nine days of her reign, on the accession of Queen Mary, Sir John Cheke was sent to the Tower, and stripped of the greatest part of his possessions. In September 1554 he obtained his liberty, and a licence from her majesty to travel abroad. He went first to Basil, thence to Italy, and afterwards returned to Strasburg, where he was reduced to the necessity of reading Greek lectures for subsistence. In 1556 he set out in an evil hour to meet his wife at Brussels: but, before he reached that city, he was seized by order of King Philip II. hoodwinked, and thrown into a waggon; and thus ignominiously conducted to a ship, which brought him to the Tower of London. He soon found that religion was the cause of his imprisonment; for he was immediately visited by two Romish priests, who piously endeavoured to convert him, but without success. However, he was at last visited by Fleckenham; who told him from the queen, that he must either comply or burn. This powerful argument had the desired effect; and Sir John Cheke accordingly complied in form, and his lands, upon certain conditions, were restored: but his remembrance soon put an end to his life. He died in September 1557, at the house of his friend Mr. Peter Osborne in Wood-street, London, and was buried in St. Alban's church. He left three sons, the eldest of whom, Henry, was knighted by Queen Elizabeth. He wrote, 1. A Latin translation of two of St. Chry-

ostom's Homilies. Lond. 1543, 4to. 2. The Hurt of Sedition. Lond. 1549, 1576, 1641. 3. Latin translation of the English communion service. Printed among Bucer's opuscula. 4. De pronunciatione Græcæ. Basil, 1555, 8vo. 5. Several letters published in his life by Strype; and a great number of other books.

CHEKIANG, a maritime province of China, to the W. of Pekin, one of the most fertile and trading provinces of that empire. It is interspersed with mountains, fruitful fields, rivers, and canals. The inhabitants are famous for making gold and silver broadened silks, which are very cheap; for they breed quantities of silk-worms. In the lakes of this country is to be found the golden fish, well known for its beauty, as also a tree which produces tallow. It contains eleven large cities, twenty-seven towns, and many populous villages.

CHE-KYANG, or TSEKIAN, a province of the empire of China, formerly the residence of the Chinese monarchs, and one of the most considerable in the whole empire. It is bounded on the south by Fo-kyen; on the north and west, by Kyang-nan, and Kyang-si; and on the east by the sea. It extends itself from the 27th to the 31st degree of north latitude, and from 116° to almost 120° of east longitude, according to the meridian of Paris. The climate of it is serene and healthy, and the inhabitants very numerous, amounting, according to their registers, to 4,525,700 men. The country is, exceedingly rich and fertile, beautifully variegated with well-cultivated mountains, fruitful valleys and plains; so that there is not a spot which is not turned to the best advantage. It is intersected by a multitude of rivers and canals; the last cut wide and deep, and lined on both sides with hewn stone. The plains on both sides have a communication with each other by a vast number of bridges, so that one may travel through the whole province either by land or water. A vast quantity of silk is manufactured in this province; which is here finer, more rich and curiously wrought with gold and silver, than in any other; and yet is so cheap, that a good silk suit will cost less than one of the most ordinary cloth in Europe. The tribute of silk paid to the emperor is said to amount to 370,466 pounds raw, and 2574 wrought, besides some other quantities of the finest, sent as a present to the court by the imperial barges. The province hath eleven capital cities, or cities of the first rank, and twenty-seven of the second and third rank; besides eighteen fortresses, most of them upon the sea-coasts, and large and populous enough to pass in other countries for considerable cities. The inhabitants are ingenious, polite, and courteous to strangers, but very superstitious.

CHELIDONIUM, CELANDINE, and HORNED or PRICKLY POPPY; a genus of the monogynia order, belonging to the polyandria class of plants. There are six species, none of which are remarkable for their beauty; but one of them, viz. the majus, is an article in the materia medica. It grows on old walls, among rubbish, and in waste shady places. The herb is of a bluish-green colour; the root of a deep red; and both contain a gold-coloured juice: their smell is disagreeable, the taste somewhat bitterish, very acrid, burning and biting the mouth; the root is the most acrid. The juice takes off warts; cures tetters, ring-worms, and the itch; and, diluted with milk, it consumes opaque white spots on the eye.—Horses, cows, goats, and swine, refuse to eat the herb.

CHELIDONIUS LAPIS, in natural history, a stone said by the ancients to be found in the stomachs of young swallows, and greatly cried up for its virtues in the falling-sickness; but, from their description, it appears to be only a

species of lycodontes, or bufonitæ. See LYCOKONTES, and BUFONITÆ.

CHELM, a town of Poland, capital of a palatinate of the same name. It is situated in the province of Red Russia. E. long. 23. 30. N. lat. 51. 25.

CHELMSFORD, the county town of Essex, situated on the river Chelmer, in E. long. 30. N. Lat. 51. 40. It sends two members to parliament.

CHELONE, in botany, a genus of the angiospermia order, belonging to the didymia class of plants. There are three species, *viz.* the *Glabra*, the *Hirsuta*, and the *Pentstemon*. They are natives of North America; and are herbaceous flowery perennials, with upright stalks two feet high, decorated with spear-shaped leaves, and beautiful spikes of monopetalous, ringent flowers, red, rose-coloured, blue, and purple. They flower from September to November, and are sometimes succeeded by ripe seeds in this country. They are very hardy plants, and may be propagated by seeds found in any soil or situation; but the two first multiply so fast by their creeping roots, that the seeds are seldom regarded.

CHELSEA, a fine village situated on the northern bank of the river Thames, a mile westward of Westminster, remarkable for a magnificent hospital of invalids and old decrepit soldiers; and a pleasure-house, called Ranelagh, to which a great deal of fine company resort in summer.

CHELTENHAM, or CHILTENHAM. See CHILTENHAM.

CHELUM, a river of Hindoostan Proper, being the westernmost of the five eastern branches of the river Indus. It rises above Cashmere, waters that city, and flowing through the province of the same name, in a S.E. direction, unites with the Indus below Moultan. This river is the famous Hydapes of Alexander.

CHEMISE, in fortification, the wall with which a bastion, or any other bulwark of earth, is lined for its greater support and strength: or it is the solidity of the wall from the talus to the stone-row.

Fire-CHEMISE, a piece of linen cloth, steeped in a composition of oil of petrol, camphor, and other combustible matters, used at sea to set fire to an enemy's vessel.

CHEMISTRY (*Encycl.*). In p. 479 of that article some mention is made of Mr. Woulfe's improvement in the receiver for distillation. To that as well as to what has been offered in this supplement under the article ACID, we wish to add the description of a chymical apparatus resembling that of Woulfe, and requiring no lute, by Mr. Girard. The ingenious apparatus of Woulfe, to which modern chemistry is so highly indebted, being attended with some slowness in the operation to which it is applied, the means of simplifying it have long been sought, and various forms have been contrived to produce this apparatus hermetically closed, and without lute. These, in general, are too difficult in the execution; but that offered by Girard to the National Institute of Paris may be put together or dismounted in a few seconds, and appears to be applicable to all circumstances.

In this construction nothing more is required, but to cause the bottles or vessels to be made at the glass-house with one of the necks A, provided with an internal AB, which is welded in the neck itself, by means of a projection or prominence in the glass, see plate 11. fig. 1. The opposite neck is first drawn out into a point or thin tube as usual; but afterwards, instead of breaking it off near the vessel to accommodate it to the subsequent fittings, it is left of the full length, and bended in such a manner that it terminates in the arc of a circle, which can be introduced into the tube AB. It is unnecessary to remark, that the tube AB₂ and the neck which is to be introduced, must

have the same curvature. This condition is very easily obtained by bending the tubes and the necks on the same cylinder of earth or wood.

It may here be readily understood, that the back or neck of the first bottle being introduced into the tube of the second, and passing further inwards than its extremity, and the interior tubes of each bottle being immersed in water, no gas can issue from the first vessel but by passing through its neck, and rising in the second through the ascertained fluid.

Fig. 2. represents another apparatus of Woulfe, which may be substituted instead of the other in case the operator reside at a distance from a glass-house. It is composed of wide-mouthed tubulated bottles. A tube is taken rather thick, and wide enough to contain another. In the upper part of this tube an enlargement must be made by blowing, and this part is to be fitted into the neck by grinding, in the same manner as stoppers are usually adjusted.

Another tube is then taken which can enter into the other with ease and freedom of motion. The extremity A of this tube is to be ground in the same manner, that it may be fitted in the neck of another bottle, and it is bended into the usual curve ABC. It is thus introduced into the tube EF, fig. 3. and the lower extremity D is turned upwards. Fig. 2. shews the manner of adjusting the apparatus, and it may be seen that it is hermetically closed, where the lower part of the large tube is plunged in the water.

The bending or curvature of the tubes and necks of the bottles is intended, as may be readily conceived, merely to answer the purpose of directing the bubbles of the gas which escape from the tube, so that they may not again enter the orifice from which they escaped. It is, therefore, unnecessary in an apparatus of any considerable magnitude, in which the neck is made to project an inch or more beyond the lower opening of the tube, for in this case the bubbles necessarily pass clear of this aperture.

Fig. 4. also exhibits another construction of this apparatus.

If an apparatus composed of a very long series of bottles were employed, there would be reason to fear that the gas contained in the first vessel, having a very strong resistance to overcome, might cause the fluid of this first bottle to rise in the tube and escape; but it would be very easy to remedy this inconvenience, either by using vessels of different sizes, or by putting a less quantity of fluid in the first than in the succeeding vessels.

The necessity of distilling the *oxygenated muriatic acid* on a large scale, has given rise to the invention of different kinds of apparatus more or less convenient. Some of these have been spoken of under the article BLEACHING. Berthollet has proposed matrasles with bent tubes, which convey the oxygenated muriatic acid to the pneumatic tub, in which the bubbles, traversing the water, are forced, by means of an agitator, to combine more or less with it. Pajot de Charmes recommends the use of tubulated retorts; but, besides these vessels have too dear, they do not answer the proposed end, since a portion of sulphuric acid not decomposed, and which injures the process, always passes into the water.

C. Widner, at Jouay, has arranged his apparatus in such a manner as to lose the least gas possible during the condensation: he receives the gas under a capsule inverted at the bottom of the apparatus; above these are two *tours de gouttière* also inverted, then another capsule above these; then two more *tours de gouttière*, and then another capsule, which terminates the apparatus. The disposition of this tub is such, that he places around in his laboratory several distilling apparatuses, which are going at the same time.

Apparatus constructed on similar principles are also in use at Glasgow and Manchester. Bourboulon-de-Bonneval has

likewise invented an apparatus consisting of several matrasles, ranged as in an aqua-fortis manufactory, the tubes of which are conveyed into a chamber containing concentrating tubs. His apparatus for the bleaching of paper is very ingenious, and deserves to be described. In the last place, others have arranged five or six large casks, like Woulfe's apparatus, in such a manner as to make each cask perform the functions of a tubulated flask. The bleachers in Ireland employ a kind of leaden alembic capable of containing forty gallons of water; a capacity more than sufficient to contain the charge, and to favour the swelling which takes place by the reciprocal action of the matters during the distillation. This alembic (see Plate 20.), of a conic form, and having a very broad base, rests in a balneum marie, in order that it may be subjected to progressive heat; and the neck is of such a height, that any sulphuric acid which happens to rise may fall back. The cover is perforated to afford a passage to the handle of an agitator, which serves to stir the matters at the bottom of the alembic: this agitator is of iron as well as its arms; but the iron is covered with a pretty thick plate of lead, that the acid may not attack it; the handle goes through a leather collar, to prevent the escape of the gas. The sulphuric acid, diluted with water, is introduced into the leaden apparatus by means of a small glass or leaden funnel, the tube of which is bent to guard against the reaction of the gas. The apparatus is also furnished with a condenser, into which the gas is made to pass. This vessel has several shelves and an agitator. The latter goes through a leather collar in the top of the condenser, passes down through the shelves, and is furnished with arms between each of the shelves; by which means the gas in its ascent is exposed to the action of the liquid in a state of great agitation, and has a long way to travel through it. (See the plate.) Mr. O'Reilly speaks of an apparatus which, in his opinion, is free from those faults which generally attend an apparatus of lead, which always becomes oxidated, and is at length destroyed. "This apparatus," says he, "consists of a series of conical matrasles with long necks, furnished with bent funnels as well as tubes, both of glass, which are conveyed into a common reservoir. This reservoir ought to be perforated in such a manner as to leave room for the introduction of a tube of a larger size (two inches), communicating with the first condensing cask or cylinder, made of white wood, twenty inches in diameter, bound round by hoops made tight with crews, and completely water-proof. Care must be taken to cover these hoops with a coating of japan, as it is called, or with oil paint, to prevent the oozings of the liquor from rusting them. The height of this cylinder must be seven or eight feet, and even more, if possible, in order to increase the pressure; and ought to have placed over it a large two-necked bottle deprived of its bottom, or a glass bell with two necks cemented to the upper edge of the cylinder. In one of these necks the large tube of the reservoir is introduced, and made to descend to the bottom of the cylinder. The air bubbles, as they are disengaged, being forced to traverse the fluid under a pressure equal to the height of the column of water, will combine with it until it be saturated; the second is also furnished with a leaden tube, the orifice of which is below the surface of the water; the superabundant gas passes through this tube, and, descending into the second cylinder of wood, similar in all respects to the preceding, saturates the water in it:—a third cylinder may be added, if judged necessary. By this arrangement the smallest portion of the gas cannot escape: care must be taken to apply a leaden cock at the bottom of each cylinder, in order to draw off the bleaching liquor as it is formed.

"The residuums, after the distillation of the oxygenated

muric acid, may be sold to earthen-ware manufacturers to be employed as a glazing for their coarse articles. The manganese contained in it gives it a blackish appearance, like that of bronze, which is far from being disagreeable to the eye. I have employed this glazing several times by way of trial; first fusing it with sand in a potter's furnace, throwing it into cold water to facilitate its division, and grinding it in a mill in order that it might be diffused in water. This glazing is attended with the advantage of being free from those dangerous qualities so common in all preparations made from the oxides of lead; but the most important object is the extraction of the soda from the sulphate of soda, which is formed in great quantity by the process, and remains in the residuum of the distillation.

"The first point is, to convert the sulphate of soda into an alkaline sulphuret. Malherbe and Athenas have succeeded in this, by employing iron as the intermediate substance: they mixed one part of charcoal dust with nine parts of the sulphate of soda, and exposed the mixture to the heat of a reverberating furnace: when the sulphuret entered into combustion, they added from three to five parts of old iron rendered as small as possible; and the whole being fused together, they obtained black paste, composed of iron, soda, sulphate of iron, &c. This mixture was lixiviated, and filtered through a basket filled with lime: it was then evaporated to dryness, and the residuum was calcined in a reverberated furnace. When soda of a superior quality is required, the washing and calcination must be repeated.

"Dizé and Le Blanc decomposed the sulphate of soda, by means of the carbonate of lime, in order to neutralize the alkali, by saturating it, at a very high temperature, with carbonic acid. Their process consists in taking two parts of sulphate of soda, dried to deprive it of its water of crystallization, two parts of well-ground chalk (carbonate of lime), and one part of charcoal powder, mixing them well in a muffled mortar, and then bringing the mixture to a white heat in a reverberated furnace: when the matter is fused it is stirred till the sulphur is consumed, and the ebullition and the jet of the flame produced by the hydrogen gas have ceased to appear. It is then taken from the furnace, and it may be lixiviated to obtain the soda very pure. In whatever manner the sulphate is decomposed, this object merits the greatest attention at bleach-fields, on account of the considerable degree of economy which results from the different manipulations. The ley of oxygenated muriatic acid will be obtained at little or no expence by bleachers, when they seriously set about extracting the soda from the sulphate formed during the distillation."

In whatever manner the muriatic acid gas may be distilled, the great object is to saturate the water with this aeriform fluid. Its action in bleaching is always stronger when employed alone than when in the state of combination with salts or earths, as in the subsequent operations. The volatility of the acid, however, is such, and the loss of the gas so enormous, that, when the thread of cloth is immersed, there is dissipated of it a quantity which may be estimated at about a third, at least, of the whole gas. The mixture of potash, indeed, renders the liquor inodorous; but besides this salt is expensive, and greatly weakens the deterfive quality of the liquor.

Mr. Rudd, of Manchester, has invented an apparatus for bleaching cloth, exceedingly simple in its construction, of small expence, and which contains the liquor in such a manner as to prevent the escape of the oxygenated muriatic acid gas. A consideration of no less importance in the arrangement of this apparatus is, the impossibility of the vapour injuring the health of the workmen.

CHENSI, a province in the N.W. part of China. It contains eight cities of the first rank, and 106 of the second and third. Besides many forts on the great wall. The air is to strangers temperate, and the inhabitants more civil and affable than others in the northern parts. The soil is fertile, and abounds in wheat and millet. They have also rhubarb, honey, wax, muls, cinabar, and coal-mines. They have a great number of deer, bears, wild bulls, and an animal resembling a tiger, whose skin is very curious. There are also muls-goats, and bats as large as hens, beside two or three other forts of animals quite unknown in Europe.

CHER, a department of France, including part of the late province of Berry. It receives its name from the river Cher, which rises in Auvergne, and watering Tours, &c. falls into the Loire, five miles above the mouth of the Indre. Bourges is the capital.

CHERSON, the capital of New Russia, in the government of Catharinenski. It is a new town, erected by the Empress Catharine II. on the north bank of the river Dnieper, 10 miles below the mouth of the Ingulec. It is not yet very large; but the church and many of the houses are built of stone, in a pretty taste. It is intended to be the principal mart of all the commodities of export and import. It has a dock for the construction of large vessels, from which several men-of-war and merchant ships have been already launched. It is supplied with fuel by reeds only, of which there is an inexhaustible forest in the shallows of the Dnieper, opposite the town. Rails, and even temporary houses, are made of them. They are tall and strong, and afford shelter to various kinds of aquatic birds, some of which are very beautiful. The fortifications are made, and the plantations formed, by malefactors, who amount to some hundreds. In 1787 the empress made a triumphant journey to this capital, and here met the Emperor Joseph II. Her intention, it is said, was to be crowned here queen of Taurica, and empress of the East. But the design, whatever it was, did not take place; and Catharine was content to have informed over one of the gates of the city, "Through this gate lies the road to Byzantium" In this place, in 1700, the celebrated Mr. Howard, so well known for his plans of reform of the different hospitals and prisons of Europe, fell a victim to his indefatigable humanity. Cherson is 50 miles E. of Oczakow. Long. 33. 10. E. Lat. 46. 5. N.

CHERZ, an ancient town of Poland, in Masovia, 15 miles from Warfaw. Long. 21. 8. W. Lat. 52. 1. N.

CHESHAM, a town in Bucks, with a market on Wednesday. It is 12 miles S.E. of Aylesbury, and 29 W. by N. of London. Long. 0. 36. W. Lat. 51. 42. N.

CHESTER, *West*, the capital of the county of Chester, in Pennsylvania. It is seated on the Delaware, and has a fine harbour. Long. 75. 27. W. Lat. 39. 54. N.

CHIARENZA, a sea-port of Turkey in Europe, in the Morea, opposite the island of Zante. Long. 21. 35. E. Lat. 37. 50. N.

CHIARO-MONTE, a town of Sicily, on a mountain, 25 miles W. of Syracuse. Long. 14. 59. E. Lat. 37. 3. N.

CHLAVERNA, *LACHETTO DI*, a small lake of the country of the Grisons, in Switzerland, near the town of the same name. The views of this lake are extremely wild and magnificent; surrounded as it is by barren rocks, craggy, and rising into spires sprinkled with snow. The bases of these dreadful precipices are lost in the dead and overshadowed water, dangerous on account of its malignant vapours, and affording no asylum, scarcely a landing-place, to the crews of those frail boats, which are caught unwarily in the violent storms to which it is subject.

Vol. X.

CHIEMSEE, a lake of Germany, in Bavaria, which contains a town of the same name, where there is a bishop's see. The island in which it stands is 17 miles in circumference, and lies 22 miles W.S.W. of Salzburg.

CHIERI, a fortified town of Piedmont, seated on the declivity of a hill, in a pleasant country, bounded on all sides by hills covered with vines. It is eight miles E. of Turin.

CHIETI, a town of the kingdom of Naples, capital of Abruzzo Citeriore, with an archbishop's see. It is seated on a mountain near the river Pescara, eight miles S.W. of Pescara. Long. 15. 7. E. Lat. 42. 20. N.

CHIGWELL, a village in Essex, near Epping Forest. Here is a free school, founded by Archbishop Harliffet, who had been vicar of this place. He was buried in the church; and his grave-stone was adorned with his figure in brass, in his pontifical robes. This, for the better preservation of it, has been fixed on the pedestal in the chancel. Chigwell is 10 miles N.E. of London.

CHIHRI, or *PORT-CHEER*, a town in Arabia Felix, with a harbour. It carries on a considerable trade. Long. 49. 25. E. Lat. 14. 40. N.

CHILKA, a lake in the Deccan of Hindoostan, which bounds the five Circars on the N. It lies on the coast of the bay of Bengal, and seems the effect of the breach of the sea over a flat sandy surface, whose elevation was something above the level of the country within. It communicates with the sea by a very narrow but deep opening, and is shallow within. It is 40 miles long from N.E. to S.W. and, in most places, 12 or 15 wide, with a narrow slip of ground between it and the sea. It has many inhabited islands in it. On the N.W. it is bounded by a ridge of mountains, a continuation of that which extends from the Mahanuddy to the Godavery River, and thence up the Circars toward the continent. To those who sail at some distance from the coast, this lake has the appearance of a deep bay; the slip of land not being visible.

CHIMAY, a town of France, in the department of the North and late province of Hainault. It is seated on the river Blanche, 20 miles S.S.W. of Charleroy. Long. 4. 15. E. Lat. 50. 0. N.

CHIMLEIGH, a town in Devonshire, with a market on Wednesday. It is almost surrounded by the river Dart, and is 21 miles N.N.W. of Exeter. Long. 3. 53. W. Lat. 50. 57. N.

CHIMNEY (*Encycl.*). In the description of the Staffordshire fire-place, the reference should have been to Plate 88 instead of 89.

CHIMNEY-SWEEPER, a miserable little wretch, scarcely human in his appearance or pretensions, employed in the drudgery of dislodging the soot from the chimneys of his employers. Of all the labours of the London Society for bettering the condition of the poor, none deserve more encomium than the methods taken to rescue this neglected and despised class of beings from perdition. We shall here give some account of what has been done, from their second volume of Reports. In August, 1798, a Sunday school, established at Kingston, was extended to the relief and instruction of the chimney-sweepers' boys in that place. They are, indeed, few in number, but they had been left (as in most parts of England those unfortunate boys are) without the means of cleanliness or of education, and without either example or instruction to induce religious or moral habits at that age which, wherever justice is done to the human character, ought to be the season of preparation for life.

They had been not only destitute of instruction, but in some degree, of clothing; and, when unemployed, were left

to wander, almost in a state of nature, excluded from the advantages of rational and Christian beings.—In order that they might be in proper condition to appear in the school, a lady of the neighbourhood, distinguished as much by her benevolence as her rank, clothed each of these poor objects in the following manner.

A jacket and pair of trowsers of coarse blue cloth	0	10	6
Two shirts	0	7	0
A pair of shoes	0	4	0
A hat	0	2	3
	<u>£</u>	<u>1</u>	<u>3</u> <u>9</u>

Besides this she sent to each chimney-sweeper's house,

A straw paillasse	1	2	0
A pair of blankets	0	17	0
A washing tub	0	6	6
	<u>£</u>	<u>2</u>	<u>5</u> <u>6</u>

and a weekly allowance of a quarter of a pound of soap.

The boys are always improving in their reading, and some of them are now beginning to read in the New Testament. They are acquiring habits of cleanliness and attention, and their manners and morals are already very greatly improved.

This school, or rather the part that respects chimney sweepers' boys, is under the direction of a committee of eight persons, together with a master and mistress appointed by them, in Brick-lane, Kingston.

OBSERVATIONS.—The above is stated for the consideration of the inhabitants of country towns; where a similar provision for these unfortunate objects might be very useful and effectually made, with very little expence or trouble. The remedy is so simple, and so easily applied, that the example needs only be given to be gradually adopted in most country towns in England.

To afford that degree of attention and relief, in London, which these boys are entitled to, in policy, as well as in justice, the provisions to be made for them will be rather more complicated, and will require some consideration. But there is no great difficulty in what is to be done. Protection and education during the period of apprenticeship, and the means of livelihood when that period expires at the age of sixteen, are all the essential parts of the plan. If these were attained, even in a qualified degree, the general condition of a chimney-sweeper's boy would not be a situation of more suffering and disadvantage, than that of persons in many other situations in life; and not subject to more hardship or danger, than the initiation into that dignified and honourable profession, from which the British nation does now derive so much security, and such distinguished glory; and in which the first families in this country are desirous of inscribing their children.

It would produce a material improvement in the condition of the chimney-sweeper's boy, and the character of the trade, if the practice of crying the streets was entirely discontinued, and if families could be induced, as in other trades, to employ those masters, whose characters are known in the neighbourhood. There is nearly as much reason for sending round the brick-layer's lad with his hod of mortar and a few bricks, screaming his master into that employment which neither his situation nor character would otherwise give him any pretension to, as the loading with his bag and implements of trade, a little child already suffering by dirt, hunger, cold, and the want of domestic comfort; and sending him to disturb the streets by his cries, till some unknown person calls him in, and employs him in his trade. How much better would it be that respectable men, like the benevolent Mr. Porter (to whose suggestions

the country are indebted for the institution of the society of master chimney-sweepers, which we shall presently notice), should be settled in every neighbourhood; their characters and conduct known; and that any orders for employment should be sent the day before, so that the master might arrange his boys' time for the ensuing day, in the same manner, and with the same regularity, as in other trades; instead of their being exhausted and destroyed, in the very act of applying for employment. If, indeed, it were in the power of every master to shew such boys as Mr. Porter's, we should have a succession of hardy and intrepid lads formed for the navy, and for those situations in which early habits of activity and enterprise are absolutely necessary.

It has been a principal object of Mr. Porter's life, that boys apprenticed to his trade should in future be protected and secured from those diseases, hardships, and dangers, for which he, by extraordinary energy of mind and body, and by the mercy of God, has been eminently preserved. With this view he has prepared, in concert with some others of his trade, a plan for its regulation; a brief detail of which will employ the remainder of this paper.

Mr. Porter commences his statement by a general approbation of the act for the relief of climbing boys, as far as the provisions extend; but observes, that those provisions are not complied with by a majority of the masters in the trade, either as to the clothing, lodging, or food of their apprentices:—That suffering and hardship are not necessarily incident to the trade, but arise merely from the want of proper internal regulations, which would soon remedy the evil. Their distresses, however, when they quit their masters, at the expiration of their apprenticeship, on attaining the age of 16 years, requires some contributory assistance from the public; they being then without money, without friends, and without the means or capacity of occupation. To provide a general system of relief, it is contrived, that the masters in the metropolis shall (with the contribution of an annual guinea from honorary members) form themselves into a friendly society for the protection of climbing boys during their apprenticeships; and for raising a fund to place out in occupations, at the age of 16, the boys of any of the members: the business of the society to be conducted by a committee, which shall be elected by and out of the honorary and other members; and from which a sub-committee of masters shall be appointed to inspect the bedding, clothing, and accommodation, of the apprentices of all masters belonging to the society, and to report whether they are comfortable to their indentures of apprenticeship, and to the regulations of the act; and to hear any complaints of the boys, to enquire as to apprenticeships, and to apply to the magistrates in those cases where the act of parliament remains unexecuted.

Such is the outline of a plan, which the society have since given more at length; and for the furtherance of which, by contributing as honorary members, the humanity, policy, and justice, of the public, have been referred to with some degree of success.

The nature of this humane institution will be best understood by the following copy of the articles of agreement, of the 19th of March, 1800, between several master chimney-sweepers within the liberties of Westminster and the Holborn division of the county of Middlesex, for forming a friendly society for the protection and instruction of their apprentices.

1st. It is hereby agreed that the said master chimney-sweepers do form themselves into a friendly society, for the protection and instruction of climbing boys during their apprenticeship; and to raise a fund, with the assistance of the honorary members of the said society, to give premiums with them to other trades, when their terms as chimney-sweepers

shall expire; in order to enable them to become useful to themselves and the community, and also to promote the general interest and credit of the trade.

2d. That all chimney-sweepers above 21 years of age, being housekeepers within the liberties of Westminster and county of Middlesex, and having one or more apprentices, be eligible as members of this society, and after election capable of being admitted, when they shall have signed these articles; and that the said society do consist of such members, so elected and admitted, and of such honorary members as are hereinafter mentioned.

3d. That this society do annually elect six members, masters in the trade, and six of the honorary members hereinafter mentioned, to be a committee, with the president, four vice-presidents, and treasurer, to conduct the affairs thereof: and that they meet at such hour and place as they shall from time to time appoint; and that any three of them constitute a board for the dispatch of business.

4th. That a general meeting of this society be held at two o'clock precisely, on the first Wednesday in the months of January, April, July, and October, in every year, to consider and approve the measures of the committee, and for other purposes.

5th. That this society do elect, by ballot, some member thereof to be treasurer, to receive the subscriptions, &c. of the members; which treasurer do give a security to such amount as the committee shall direct; and do pay all subscriptions and other monies received, into the banking-house of the society, to be entered with the names of the several subscribers, so as it may all pass through that account.

6th. That the committee have full permission, at all reasonable times of the day, to inspect the bedding, clothing, &c. of all apprentices belonging to the members of this society, to see whether they be according to the tenor of the indenture of such apprentices, and conformable to the regulations contained in the act of parliament, and also that they do make report thereof to the society at their general meetings.

7th. That it is the duty of every member of the committee, at all times, to hear the complaints of any apprentice in the trade, within the liberties of Westminster and county of Middlesex, and to summon before a magistrate any master or mistress who may violate the act of parliament made for the relief of climbing boys.

8th. That the society do place out each boy, who shall complete the whole term of his apprenticeship as a chimney-sweeper, to some other trade, not a chimney-sweeper, from the period when he shall be 16 years of age until he attain the age of 21; provided he does not enter into an engagement to continue with his master, or some other master of the trade, being a member of this society, during that time; and that the society do give a premium, not exceeding 10*l*., for that purpose.

9th. That this society give a gratuity, not exceeding 10*l*. to every person whose apprenticeship, as a chimney-sweeper, shall expire after the 1st day of July, 1800, in case he shall from that time continue in the sea service, or as an articulated servant to a member or members of this society, from the age of 16 to the age of 21; and that such gratuity be paid him within three months after his attaining the age of 21.

10th. That this society do take security from any person, to whom they may give a premium with an apprentice, that such apprentice shall not follow the trade or business of a chimney-sweeper, before he be 21 years of age.

11th. That this society will countenance no person whatsoever who shall have been on his own hands, or out of employ, any six months, from 16 to 21 years of age, except from such cause as the committee shall think reasonable.

12th. That this society give premiums to none but appren-

tices of the members of this society; but that it do, in other cases, lend its friendly aid to all chimney-sweepers' apprentices.

13th. That at any time when the money in the hands of the treasurer shall amount to 20*l*. he shall place the same, in the name of the society, in the banking-house of Messrs. Dorlet, Johnson, and Co. bankers, in New Bond-street, or at such other banking-house as the society, or the committee, may appoint.

14th. That all orders for the payment of money on account of the society, be signed by the chairman and two of the committee, at a general quarterly meeting.

15th. That every member in the trade, on admission into this society, pay the sum of 10*s*. 6*d*. and from the day of such admission pay the sum of 1*s*. per month, for every apprentice he or she may keep: such payment to be made once in every three months; and in case he or she shall leave any arrears unpaid, for more than three months after the time such respective sum or sums shall become due (he or she having had one calendar month's notice thereof), that then he or she shall be expelled the society, and the money paid by them forfeited for the benefit of the general fund.

16th. That all persons, not in the trade, contributing one guinea, or more, annually, or paying ten guineas at once to the funds of the society, be honorary members, and have a right to vote at all meetings thereof.

17th. That this society do annually choose a president, four vice-presidents, a treasurer, and twelve other members of the committee, for conducting the affairs of the society, at their general meeting, at two o'clock precisely, on the first Wednesday of the month of April, in every year; and (her Royal Highness the Duchess of Gloucester having been elected and declared the patroness of the society, and Mrs. Montague the vice-patroness, and the Lord-bishop of Durham the president of the society for the ensuing year) that the society do meet on the first Wednesday in the month of April next, to elect four vice-presidents, a treasurer, and six honorary members, and six members in the trade, to be, with the president, a committee for the ensuing year.

18th. That nothing be admitted as a law of this society, unless it be proposed at one meeting of the committee, approved of by the next, and confirmed at a general quarterly meeting of the society.

19th, and lastly. That the amount of all fines awarded by a magistrate to any member of this society, for any transgression against the act of parliament made for the relief of climbing boys, be paid into the hands of the treasurer for the general purposes of the society; and that the expenses of any complaint or proceedings before a magistrate, by order of the committee, be paid out of the funds of the society. In witness whereof the said parties have hereunder signed their respective names, the day and year first above written.

These articles have been signed by eighteen of the principal masters in the trade, and fifty-six chimney-sweepers' boys have been thereby placed under the care of the society; an example that we hope will be followed in other places.

CHINEY, a town of the Austrian Netherlands, on the confines of the bishopric of Liege, eight miles E. of Dinant. Long. 4. 57. E. Lat. 50. 18. N.

CHINSURA, a neat and pretty large town of Hindoostan Proper, in Bengal. It is a settlement of the Dutch, and is seated on the river Hoogly, nearly midway between Chandernagore, and the old town of Hoogly. It is very distinguishable at a considerable distance, and has a handsome appearance. It contains several good houses, and a church, with a little mole projecting into the river.

CHIRK, a village S. of Wrexham, in Denbighshire. It had formerly two castles, on the top of a hill, one of which

is still entire in many parts, and seems to have been a magnificent structure.

CHISLEHURST, a village of Kent, near Bromley. Here is Camden Place, the ancient seat of the Earl of Camden, and the residence of the celebrated antiquary of that name, who died here. Chislehurst was also the birth-place of Sir Nicholas Bacon and Sir Francis Walsingham. It is 11 miles S.E. of London.

CHISME, a sea-port of Natolia, on the strait that parts the continent from the isle of Scio. It was anciently called Cyflus, was celebrated by the great victory which the Romans gained here over the fleet of Antiochus, in the year 191 B.C. and has been recently distinguished by the total destruction of the Turkish fleet by the Russians in 1770.

CHISWICK, a village in Middlesex, on the Thames. Here is Chiswick-house, a celebrated villa of the Duke of Devonshire, built by the Earl of Burlington, after a design of Palladio. In the church yard is a monument to the memory of Hogarth, with an epitaph by Garrick. Chiswick is five miles W. by S. of London.

CHITRO, a town of Turkey in Europe, on the bay of Salonichi; the place where the mother, wife, and son of Alexander, were murdered by Cassander; and where Perseus king of Macedonia was defeated by the Romans. Long. 22. 35. E. Lat. 40. 20. N.

CHITTEDROOG, a town of the peninsula of Hindoostan, in the kingdom of Mysore, 117 miles N. by W. of Seringapatam. Long. 76. 15. E. Lat. 14. 3. N.

CHIVALRY (*Encycl.*). In addition to what has already been offered under this article, some obvious circumstances of agreement between the heroic and Gothic manners may be worth the reader's attention:

1. The military enthusiasm of the barons, is but of a piece with the fanaticism of the heroes. Hence the same particularity of description in the accounts of battles, wounds, deaths, in the Greek poet, as in the Gothic romance. Hence that minute curiosity in the display of their dresses, arms, and accoutrements. The minds of all men being occupied with war-like images and ideas, were much gratified by those details which appear cold and uninteresting to modern readers.

We hear much of knight-errants encountering giants, and quelling savages, in books of chivalry. These giants were oppressive feudal lords, and every lord was to be met with, like the giant, in his strong-hold or castle. Their dependents of a lower form, who imitated the violence of their superiors, and had not their castles, but lurking places, were the savages of romance. The greater lord was called a giant for his power; the less, a savage, for his brutality.

Another terror of the Gothic ages, was monsters, dragons, and serpents. Their stories were received in those days for several reasons: 1. From the vulgar belief of enchantments: 2. From their being reported on the faith of eastern tradition, by adventurers from the holy land: 3. In still later times from the strange things told and believed on the discovery of the new world.

In all these respects, Greek antiquity resembles the Gothic. For what are Homer's Læstrigons and Cyclops, but bands of lawless savages, with each of them a giant of enormous size at their head? And what are the Grecian Bacchus, Hercules, and Theseus, but knights-errant, the exact counterparts of Sir Lancelot, and Amadis de Gaul?

3. The oppressions which it was the glory of the knights to avenge, were frequently carried on, as we are told, by the charms and enchantments of women. These charms, we may suppose, are often metaphorical; as expressing only the blandishments of the sex. Sometimes they are taken to be real, the ignorance of those ages acquiescing in such conceits.

And are not these stories watched by those of Calypso and Circe, the enchantresses of the Greek Poet?

4. Robbery and piracy were honourable in both: so far were they from reflecting any discredit on the ancient or modern *redressers of wrongs*. What account can be given of this, but that, in the feudal times, and in the early days of Greece, when government was weak, and unable to redress the injuries of petty sovereigns, it would be glorious for private adventurers to undertake this work; and, if they could accomplish it in no other way, to pay them in kind by downright plunder and rapine?

5. Bastardy was in credit with both. They were extremely watchful over the chastity of their own women; but such as they could seize upon in the enemies' quarter, were lawful prize. Or if, at any time, they transgressed in this sort at home, the fault was covered by an ingenious fiction. The offspring was reputed divine. Their greatest heroes were the fruit of goddesses approached by mortals; just as we hear of the doughtiest knights being born of fairies.

6. With the greatest fierceness and savageness of character, the utmost generosity, hospitality, and courtesy, was imputed to the heroic ages. Achilles was at once the most relentless, vindictive, implacable, and the friendliest of men. We have the very same representation in the Gothic romances. As in those lawless times, dangers and distresses of all kinds abounded, there would be the same demand for compassion, gentleness, and generous attachments to the unfortunate, those especially of their own clan, as of resentment, rage, and animosity against their enemies.

7. Again, the martial games celebrated in ancient Greece, on great and solemn occasions, had the same origin, and the same purpose, as the tournaments of the Gothic warriors.

8. Lastly, the passion for adventures, so natural in their situation, would be as naturally attended with the love of praise and glory. Hence the same encouragement, in the old Greek and Gothic times, to panegyrics and poets. In the affairs of religion and gallantry, indeed, the resemblance between the hero and the knight is not so striking. But the religious character of the knight was an accident of the times, and no proper effect of his civil condition. And that his devotion for the fair sex should so far surpass that of the hero, is a confirmation of the system here advanced. For the consideration had of the females in the feudal constitution, will of itself account for this deference. It made them capable of succeeding to fiefs, as well as the men. And does not one see, on the instant, what respect and dependence this privilege would draw upon them?

It was of mighty consequence who should obtain the favour of a rich heiress. And though, in the strict feudal times, she was supposed to be in the power and at the disposal of her superior lord, yet this rigid state of things did not last long. Hence we find some distressed damsel was the spring and mover of every knight's adventure. She was to be rescued by his arms, or won by the fame and admiration of his prowess. The plain meaning of all which was this: That as, in these turbulent times, a protector was necessary to the weakness of the sex, so the courteous and valorous knight was to approve himself fully qualified for that purpose.

It may be observed, that the two poems of Homer were intended to expose the mischiefs and inconveniences arising from the political state of Old Greece: the *Iliad*, the dissensions that naturally spring up among independent chiefs; and the *Odyssey*, the insolence of their greater subjects, more especially when unrestrained by the presence of their sove-

reign. And can any thing more exactly resemble the condition of the feudal times, when, on occasion of any great enterprise, as that of the crusades, the designs of the confederate Christian states were perpetually frustrated, or interrupted at least, by the dissensions of their leaders; and their affairs at home as perpetually distressed and disordered by the rebellious usurpations of their greater vassals? Jerusalem was to the European, what Troy had been to the Grecian princes.

CHIVAS, a town of Piedmont, which has been several times taken and retaken. It is so advantageously situated near the river Po, that it is the key of Italy. It is 12 miles N.E. of Turin. Long. 7. 47. E. Lat. 45. 13. N.

CHIUSI, an episcopal town of Italy, in Tuscany, poorly peopled, on account of the unwholesome air, 35 miles S.E. of Sienna. Long. 10. 52. E. Lat. 43. 0. N.

CHIUTAYE, a town of Turkey in Asia, capital of Natolia Proper, and the residence of the Grand-signior before the taking of Constantinople. It is seated on the river Ayala, 75 miles E. of Bursa. Long. 30. 47. E. Lat. 39. 30. N.

CHOCZIM, a town of Moldavia, on the Dniester. It was taken by the Russians and Austrians in 1788, but restored to the Turks at the subsequent peace. It is 110 miles N.W. of Jassy. Long. 26. 25. E. Lat. 48. 46. N.

CHOISEY, a village of France, in the department of Oise, and late province of the Isle of France. It is three miles from Compiègne, on the river Aisne, in the fine forest of Compiègne, on which account here was a handsome royal hunting palace.

CHOLET, a town of France, in the department of Maine and Loire, and late province of Anjou, with a castle, 170 miles S.W. of Paris. Long. 0. 45. W. Lat. 47. 10. N.

CHONAT, an episcopal town of Hungary, capital of a country of the same name, on the Merich, 25 miles E. of Segedin. Long. 21. 4. E. Lat. 46. 20. N.

CHORGES, a town of France in the department of the Upper Alps, and late province of Dauphiny, burnt by the Duke of Savoy in 1692. It is 10 miles E. of Gap. Long. 6. 23. E. Lat. 44. 35. N.

CHOWLE, a small town of the Deccan of Hindoostan, on the coast of Malabar. It has a harbour for small vessels, and is fortified. It belongs to Portugal, and was formerly noted for its fine embroidered quilts and a good trade. It is 15 miles S. of Bombay. Long. 72. 45. E. Lat. 18. 42. N.

CHRISTIANOPLE, a strong sea-port of Sweden, on the Baltic, and capital of Blekingen. It is 13 miles N.E. of Carlskroon. Long. 15. 47. E. Lat. 56. 26. N.

CHRISTIANBURG, a fort of Africa, on the Gold Coast of Guinea, subject to the Danes. Long. 1. 55. E. Lat. 4. 10. N.

CHRONOLOGY (*Encycl.*). We record the following events in continuation of our former article:

1796 Amboyna taken by the English.—Amberg taken by the French.—Severe engagement between the Austrians and French at Lodi, in which the latter behaved most gallantly, and were successful.—Siege of Mantua raised by the French.—Swiss independence abolished by the French after a most gallant resistance.—Ceylon surrendered to the English.—Corfica having put herself under the protection of England, was relinquished to the French.—Minorca taken by the English.—Peace with France concluded by Naples and Sardinia.—War between England and Spain.

1797 A tribulation and some upright portions of Stonehenge fell after a frost.—Bank of England prohibited by

government from paying in specie.—Their 20s. and 2l. notes issued, and large quantities of stamped dollars brought into circulation.—The king's procession to St. Paul's church, to return thanks for a series of victories obtained by the English navy.—The most formidable mutiny ever known, and at a most critical period, in the British fleets at the Nore and at Portsmouth, headed by a desperado of the name of Parker, afterwards hanged with several others.—Penny pieces, of copper, first issued.—Revolution effected in Venice by the French.—Corfu seized by the French.—A contemptible French force landed in Wales.—Mantua surrendered to the French.—Trinidad taken by the English.—War between Austria and France terminated by the peace at Leoben.—Cisalpine republic founded by the French.—Ireland first invaded by the French republicans.—Venice ceded to Austria by the French.—Two millions and a half voluntarily contributed in Britain to support the war against the French.—Lewis XVIII. the French pretender, retired to Peterburgh.—The Pope driven out of Rome by the French, who brought about a revolution.—Piedmont relinquished by its sovereign to the French.—Alexandria taken possession of by the French.—The gates and sluices of the canal at Bruges blown up by the English, who, prevented from re-embarking by tempestuous weather, after a severe resistance, were made prisoners.—Malta and Egypt seized by a French force under Bonaparte.—Ireland in a state of rebellion, invaded by the French, who afterwards surrendered themselves prisoners.—Turin entered by the French.—War renewed between France, Naples, and Sardinia.—Habeas Corpus act suspended.—Inoculation of the cow-pox discovered and first practised in England.—Export of British manufactured goods 34 millions in value.—The national debt of England 397,087,674l.

1799 Coin in circulation forty-four millions.—Corfica relinquished by England and repossessed by the French.—The volunteer corps of London and its vicinity reviewed by the king.—Pope Pius VI. died a prisoner in France.—Acre preserved against repeated assaults of the French army in Egypt under Bonaparte, by Sir Sidney Smith.—Alexandria, Ancona, and other places in Italy, surrendered by the French to the Austro-Russian army.—Tippon Saib defeated and slain near Perispatum by the English.—The French republicans driven out of Italy by the Russian army under Suwarow.—The French dispossessed of Corfu by the Russians.—Holland unsuccessfully invaded by the British army under the Duke of York.—Leghorn entered by the French.—Naples taken by the French, and afterwards recovered.—The Dutch navy in the Texel surrendered to the British fleet under Admiral Mitchell.—Serlingapatam formed by the English under General Harris, and Tippon Sultan slain.—Tuscany seized and afterwards evacuated by the French.—Turin abandoned by the French.—War renewed between France and Austria.—Zurich evacuated by the French.—Income taxed in the British dominions.

1800 Ireland united to Great Britain.—Bread one shilling and ten-pence halfpenny the quarter loaf in London.—9,774 French Emigrants, clergy and laity,

in England.—The Royal Institution of Great Britain founded by charter.—Ineffectual conspiracy against the life of the First Consul of France.—War between France and Austria in Italy terminated, and was followed by the treaty of Lunéville.—Mr. Jefferson elected President of the United States of America.—The British army, under Sir Ralph Abercromby, landed at Aboukir, under prodigious disadvantages, and completely routed the “*invincible legion*” of Bonaparte.—Paul I. emperor of Russia, died.—War declared by Spain against Portugal.—A gallant and successful attack made on Copenhagen by a division of the English fleet in the Baltic, under Lord Nelson.—Hanover entered by the Prussian troops.—St. Eustatia surrendered to a British force.—A treaty of peace between Spain and Portugal signed at Badajoz.—The differences between England and Russia adjusted, and a convention signed.—The French, at Cairo, capitulated to the army under General Hutchinson.—A signal victory, gained over a greatly superior force, of French and Spanish ships, near Algiers.—A dreadful hurricane at Barbadoes.—Madeira taken possession of by a British force.—Alexandria, with the whole of the French forces, surrendered to the British and Turkish forces.—The French Emigrant bishops required by the Pope to surrender their sees to Bonaparte.—Preliminaries of Peace signed between England and France.—Peace between France and Portugal proclaimed at Paris.—Preliminaries of peace signed between France and Turkey.—A new constitution, after the French fashion, given to Holland.—The new constitution of Switzerland overthrown by a French party as not sufficiently conforming to the views of the First Consul.—Hanover evacuated by Prussia.—A dreadful inundation in Italy.—The intercourse between England and France re-established by Act of Parliament.

CHUDLEIGH, a town of Devonshire, with a market on Saturday. It is seated near the river Teigne, nine miles S. W. of Exeter, and 183 W. by S. of London. Long. 3. 39. W. Lat. 50. 38. N.

CHUNAR, a fort of Hindoostan Proper, in the province of Allahabad. It is seated on the Ganges, twenty miles above Benares, and is built on a rock, which is fortified all round by a wall, and towers at various distances. At the end, overlooking the river, is situated the citadel, which has formerly been strong. This fort is said to be of the highest antiquity, and originally built by the Hindoos. In the citadel is an altar, consisting of a plain black marble slab, on which the tutelary deity of the place is traditionally supposed to be seated at all times, except from sun-rise till nine in the morning, when he is at Benares; during which time, from the superstition of the Hindoos, attacks may be made with a prospect of success. Chunar has always been considered as a post of great consequence on the Ganges, from its insulated situation, projecting forward to a great extent, and being of considerable height. It was unsuccessfully attempted by the English in 1764: the next year, it was surrendered to them: they restored it to the Nabob of Oude at the subsequent peace; but, in 1772, it was finally ceded to the English, by that prince, in exchange for Allahabad. At this place is kept the magazine of ammunition and artillery for the brigade at Cawnpore. It is 385 miles N. W. of Calcutta. Long. 83. 50. E. Lat. 25. 10. N.

CHUNAUB, or **JENAU**, a river of Hindoostan Proper, one

of the five eastern branches of the Indus. It runs through Cashmere and Lahore, between the Chelum and the Ranvee. It is united with both these rivers at some distance above Moultan; and, at their confluence with the Indus, twenty miles W. of Moultan, they form a stream as large as that river. The Chunaub is the Acesines of Alexander.

CHURCH (*Encycl.*). To what has been said under this head it may not be improper to add the following representation of the state of the Church of England.

The religion of a country always engages the close attention of the enquiring observer. The government, laws, manners, and even literature of a people are often greatly affected by the nature and influence of their religious system. This observation forcibly applies to the country in which we live; and, therefore, a particular examination of the state of religion, or the exact condition of its national church, and that of the different sects which are removed from it, must be not only amusing, but useful. It is unnecessary to give an historical retrospect of the reformation in England, of the progress of the Anglican church from its establishment to the present time. Few persons are unacquainted with these points who have paid any attention to our national history. In two material articles only did our first reformers differ from their brethren on the Continent: I mean in adopting a national liturgy, and preserving the episcopal government of the church. These objects produced dissenters, who, from their hatred of popery, wanted to be as dissimilar to the church of Rome as possible. They pretended that their only motive for dissent was a desire of greater purity in church order and worship; and thence the name of *puritans* was given to them, which afterwards was lost in the term *nonconformists*, on account of their pertinaciously refusing the terms of conformity to the church. Within the last century, they have usually been called protestant dissenters, a moderate appellation, sanctioned by acts of parliament, and originally given at the time of the revolution, when the act of toleration was justly extended to them.

That revolution had a wonderful and extensive effect upon the church of England. Some of her most exemplary prelates, and most learned clergy, were thrust out from her service, because they could not bring their consciences to digest a new oath in violation of that which they had before solemnly and repeatedly taken. The convocation also, or that right which the clergy had for so many ages enjoyed, of meeting at the same time with parliament, to consult upon the state of the church, was taken away, or so far reduced as to become insignificant. From that period the ecclesiastical body lost its corporate powers, and fell into the general mass of society almost undistinguished, except by being exposed to peculiar calumny and contempt. Infidelity arose under the patronage of the highest personages, and the word *priestcraft* was invented by men of wit, in order to stigmatise all religion. Plays, novels, poems, and pictures, usually exhibited the figure of a *parson* in some contemptible manner, with a view to bring the order itself, and the religion of which they were ministers, into popular disesteem. It must be admitted, that the clergy were in a considerable degree the authors of their own disgrace, by adopting, in general, what was called a system of *moderation*, or a dereliction of the constituent principles and doctrines of the church. Too many of our most eminent divines, observing what strain of preaching, and what kind of opinions and conduct, best suited the men in power, gave way to the stream which led to elevated stations, rather than adhere to a system which they saw growing every day more and more unfashionable. The reader, unacquainted with the fact,

would almost question the truth of the assertion, that men who were not only known to have been adverse to the radical principles of the church of England, but had even written books against them, were advanced to high stations, and pushed on from one degree of preferment to another, as far as their own most sanguine wishes could aspire. While, on the other hand, their ablest antagonists, the founders and best of our divines, were suffered to remain in obscurity, unnoticed and unrewarded. It is an incontrovertible fact, and there is no reason for suppressing or qualifying it, that in the two reigns immediately preceding the present, a marked countenance was given to the latitudinarian divines of the establishment. We would not be understood to mean, that all who were elevated to episcopal thrones, or other dignities, were exactly of this description, but they were too generally such. The consequence of this was, that the character of the church of England lost ground considerably, because it was observed that her ministers generally slighted, or openly opposed, her principal doctrines. The style of preaching adopted in almost all pulpits was alike dry and unedifying; and the subjects discussed such as might with equal propriety have graced the mouth of a heathen moralist as a christian minister. Hence it was that those persons who had better conceptions of religion than the generality, and began to form serious notions upon Christianity, abandoned the churches, and betook themselves to the meeting-houses, where some regard was paid to the doctrines of the Gospel. At that period the dissenting interest flourished, because the greater part of its teachers adhered to the doctrinal principles of the reformation; and every man who has right sentiments of the importance of religious worship will wish to go where he can best be edified. Religious instruction and moral instruction are two distinct things; where the former is rightly enforced and explained, the latter follows as a natural inference. But if morals only are inculcated, religion may be considered as an article either absolutely unnecessary, or as merely indifferent. In this state of things scepticism and sectarianism spread themselves around with a powerful and extended force. Many great men saw the evil, but being inattentive to the cause, they failed in applying the proper remedy. Dr. Gibbon, the worthy bishop of London, in his pastoral letters, expressed himself with great energy and propriety on the increase of infidelity and licentiousness; but though he had the hand of an acute anatomist, he had not sufficient discernment to mark among the various sources the grand seat of the malady. About this time a sect of men arose, who, in the most irregular manner, but with the best intentions, produced a change in the religious aspect of the country, which has continued to the present day. We allude to the rise of the methodists at Oxford, of whom, and their proceedings, we shall say no more in this place, than that by calling the attention of men to the doctrinal principles of religion as the only effectual ground of moral practice, they met with uncommon success. They asserted, and with truth, that the clergy of the church of England had almost totally rejected the articles which they had subscribed, and professed their resolution to preach. These men justly maintained that in christianity *faith* was as necessary *as practice*, and that the latter is not truly religious unless it results from the former. So far the methodists were warranted by the church of which they were members, but in many other particulars they acted very reprehensibly. However, the progress they made, and the zeal which they manifested, opened the eyes of many divines of the establishment, and they became convinced of the necessity of preaching the peculiar doctrines of christianity as laid down in the confession of the church of England. At first these worthy men met with considerable opposition from their brethren, and con-

tempt from those who arrogated to themselves the high-sounding, but frivolous, appellation of rational christians. These divines were stigmatised with the nickname of *Hutchinsonians*, because they respected some of the opinions of *John Hutchinson*, a philosopher of an extraordinary cast, but who was no sectarist. Hutchinson was a great admirer of the Hebrew scriptures, and in the warmth of his admiration thought he had discovered in them all the principles of philosophy. He saw that the great mathematical philosophers of his time were either opposers of, or corruptors of, the christian truth, and this led him to adopt a system of scriptural philosophy, which, in his judgment, was clearly revealed in the writings of Moses. Whether he was right we shall not stay to enquire, but certain it is, that by bringing the study of the Hebrew scriptures into repute, the man did an inestimable service to the cause of christianity. Some Oxford divines were drawn by the writings of Hutchinson to study what had been too long neglected; and being zealous lovers of the church of England, they distinguished themselves by a firm adherence to her constituent principles and doctrines. They did not, like the *methodists*, erect a separate sect, although, like them, they suffered much obloquy from their brethren, and were counted little better than madmen by the world. Much contempt was thrown upon them even in their own university; and that of Cambridge, jealous of her philosophical and mathematical honours, treated these upstarts with most virulent animosity. It may be proper here to observe, that the controversy set on foot by the profound Warburton, in his *Divine Legation*, induced many to study the Hebrew scriptures, and this led them to the writings of Hutchinson, who certainly struck out many lights of admirable utility to the biblical student. The principal of those who adopted Hutchinson's opinions were Mr. George Horne (afterwards the seraphic bishop of Norwich), Dr. Patten, Dr. Wetherall (now dean of Hereford), Mr. William Jones, the late worthy rector of Nayland, and author of numerous publications, and Mr. William Romaine, whose praise is in all the churches. All these luminaries shone forth at Oxford, and by their example brought many theological students to a more rational direction of their academical labours. But Cambridge was not without some distinguished persons of the same stamp, the principal of whom was the late learned and truly primitive divine Mr. John Parkhurst. The contumely which first attended the revivers of primitive learning and religion at length grew weak, for the world saw that the objects of it were not only most exemplary in their lives, but scriptural in their religious views, and peculiarly edifying in their public labours. Their example stimulated others to exert themselves as zealous and active ministers of the church; and in the present reign men of this description have met with liberal encouragement from the higher powers. The jejune, flimsy, moral harangues, which had for so long a period disgraced the pulpits of the national churches, have been generally discarded. Our prelates have directed their clergy to preserve and manifest a doctrinal consistency. Hence it has happened that the dissenting interest has declined, and the churches which were wont to be empty are now crowded. Even the *methodists* have found it necessary to their interest to retain the liturgy of the church of England in their chapels, and the general appearance of conformity to its ceremonies, in order to preserve their congregations. Great attempts have been made during the reign of his present majesty to shake the foundations of the church, and the number and weight of her adversaries once appeared to be exceedingly formidable.

The first direct attack was made in 1772 by the petitioning clergy to effect an abolition of subscription to the thirty-nine articles. The struggle made on this occasion was very car-

rest, but the attempt proved abortive, and the church preserved her bast fortify. The dereliction of her ancient confession would be the loss of her most distinguishing and excellent characteristic. A trial was afterwards made in 1790, to procure a repeal of the corporation and test acts, in which the enemies of the national church were again foiled.

At present the appears to have little room for fear, provided the public peace is secured, and the is kept from any of those plausible innovations, which intriguing minds know so well how to mould and colour, and adapt to popular fancy, in order to effect their secret purpose. This shews how vigilant the governors and other friends of the establishment ought to be over her internal and external condition. Every thing should be done to encourage a learned and evangelical ministry. The people at large are observed to be pleased with divines of this description. This is a spirit which should be encouraged, and nothing can do it so effectually as giving countenance to men who are warm and animated in the cause of sound Christianity. But peculiar care seems to be necessary not to admit into the church offices a body of self-sufficient enthusiastic sectaries. Many lay-preachers who have flourished away in conventicles, have conceived an ambitious desire to get into the church, and it is to be lamented that, from want of sufficient enquiry on the part of our bishops, they have too often succeeded. This has brought an odium upon our establishment in many instances; and as it is an evil which still subsists, the caution cannot be too strongly or particularly enforced. At a time when the dissenting interest is evidently declining, little doubt can be entertained but that many of its ministers will endeavour to shelter themselves under the broad wing of the establishment. Men who have their private advantage at heart, will not, on account of small scruples, neglect an opportunity of preferment. But it is the duty of those who are at the head of the church to guard against the intrusion of interested pretenders. Some doubts may be entertained whether it is proper to admit to the pulpit and to the altar of the established church, men who have long been in habits of opposing her welfare, and weakening her influence; but if such an opinion should be thought too exclusive, it is not too much to assert, that such admissions ought only to take place on strict proof of sincere, affectionate, and disinterested attachment to the national establishment; with candour, and a display of talents calculated to aid the influence of the church, to weaken her enemies, and inspire and strengthen her real friends.

CATHOLIC CHURCH (*Encycl.*). Of the various religious bodies opposed to the church of England, the Roman-catholics are entitled to the first place on account of their antiquity. The time was, when their church was proudly dominant in this land; and when England formed one of the most valuable jewels in the tiara. Providence, which usually produces the most important and extensive benefits from the most trifling and unlikely incidents, effected the destruction of the pontifical authority by the instrumentalty of its most zealous defender. The infant that the Pope put a barrier in the way of Henry VIII. to hinder him from repudiating his consort, and marrying Anne Boleyn, this haughty monarch, who had hitherto approved himself a dutiful son of the church, repented the affront and shook off the papal yoke. A reformation begun from such motives, could not well be otherwise than violent. Sanguinary laws were enacted against all the advocates of the Pope's supremacy; and the monastic orders being annihilated, their lands were distributed among the rapacious courtiers. It cannot be supposed that such a stupendous change could take place without irritating the minds of those who were attached to the ancient superstition, especially at a time when gospel light was but feeble, when priestly absolu-

tions were looked upon as the cleansers of guilt, and the prayer of the church as effectual passports to heaven. It was natural enough for the catholics to feel a repentment at the usage they had met with, and for the clergy to labour earnestly in making converts. Nor is it to be wondered at that some struggles were made by them to regain their lost influence, and to restore the church which they had seen despoiled and mutilated. For this earnestness and zeal, the character of the age, and the circumstances in which they stood, may furnish some excuse; but it must be admitted that they manifested a spirit for which no plea can possibly be allowed; formed conspiracies of so atrocious a nature that all the ingenuity of man cannot palliate them; and had recourse to subtleties to carry on their schemes, irreconcilable to any system of morality, however weak or corrupted. In proportion as knowledge increased, the number of Roman-catholics lessened; and as the spread of truth was great during the eighteenth century, the interests of popery rapidly sunk. It must be allowed that other causes have concurred to produce this declension. The desire of civil distinctions and military employments led many persons to renounce the creed of their ancestors, and to embrace, at least nominally, the profession of protestantism. Others, having imbibed the fashionable philosophy of the French sceptics, soon threw off a religion which was not only troublesome, but in many respects degrading; as giving an authority to priests over the mind, which cannot but be very offensive to libertine spirits. To these circumstances we may well ascribe the low state into which the church of Rome has fallen with respect to this country. There can be little room to apprehend that ever the Roman-catholic profession will rise to a more distinguished appearance, or that its followers will become more numerous. Such fears were once indulged, and that by men from whom more liberality of sentiment might have been expected. A slavish obedience to priestly authority can never take place among persons possessing the advantages of even a common education, unless they have imbibed that principle with their mother's milk. The slightest acquaintance with the sacred writings will keep men from receiving doctrines and ceremonies, which are foreign to the divine word; and if they have a turn for scepticism, we may well suppose them still further remote from the superstitions of popery; on every ground, therefore, we may conclude, that the present waning of the church of Rome will end in a total obscuration. It is observable, that some of the ablest members of that church in this country are possessed of a truly liberal spirit. The catholic clergy in England are divided into two classes—the rigid and the moderate. The former maintain all the dogmata of Pope Pius's creed; all the decisions of the Tridentine council, without any abatement or qualification; and hold the authority of the pope to be supreme in all cases, and over all persons: they moreover reject from salvation, or the communion of Christ, all who do not belong to their particular church; in short, these catholics (improperly so termed), disregarding every principle of genuine benevolence, look down upon other Christians either with contempt or pity. The fact is, these persons do act with most consistency; because, if their church is infallible, which must be the fundamental principle of their creed, they dare not differ from the decisions which the aforesaid council has laid down; and all that is here stated, is perfectly agreeable to that council. However, there are not wanting many catholics, who call themselves dissenters, that hold different sentiments; and limit, in the first place, the pope's authority merely to spiritual matters; and even in these they will hardly allow him an absolute freedom from error. After this grand concession, it is not to be wondered at that these persons should give up many other articles. For instance, they ad-

mit the falvability of heretics and heathens dying unbaptized ; they plead for a general interpretation of the sacred word ; they deny the doctrine of transubstantiation in a gross sense ; they wish to have the cup allowed to the laity ; and give up many other matters of no little moment in the great difference between the Roman and Protestant churches. This party is visibly increasing, and that more particularly, in proportion as the general strength of the papal power decreases abroad ; the natural consequence of which must be, that the number of Roman-catholics will suffer a rapid diminution. When we consider the influence of such men as Mr. Huxley, Dr. O'Leary, and Mr. Berington, we can have little doubt but that even doctrinal popery will ultimately sink into nothing.

The outworks of their cause have been abandoned as untenable and useless ; and as they no longer lay the scriptures under a fort of interdict, but readily allow the laity to study them, the protestant interest must rise in consequence. Infidelity tends greatly to shake down the towers and battlements of the Roman church, but the knowledge of truth will sap its very foundations. It may be accounted among some of the prodigies of this wonderful period, that a priest of the Roman communion should have undertaken a translation of the scriptures into the vulgar tongue, in the preface and notes to which, he positively denies the inspiration of the writers. Dr. Geddes has far outdone Dr. Priestley in this respect. The Socinian champion, not knowing how to combat the authority of St. Paul, had recourse to this subterfuge, that he was not always under the divine direction, and that in many places he was an "inconclusive reasoner," because the doctor did not approve of his argument. Here, however, the doctor was merely serving the cause of his sect ; but Dr. Geddes has not such partialities. He gives up the authority of his church and his infallibility at once, by placing the sacred writings on a footing with the profane. Nay, he does not scruple to say, that the historians of the Bible are inferior, as writers, to Thucydides and Livy. What would have been the outcry if a clergyman of the church of England had advanced such assertions, and that too in a new version of the sacred books ? Would the bishops have been to blame if they had taken particular notice of the writer ? The man who endeavours to undermine the sacred scriptures can make but a sorry minister of the gospel. With what face can a man address his congregation, and confirm his arguments by an appeal to a book which they look upon as divine, and he regards as human ? Were such a case to happen in our church, it would be a matter of complaint if the person so offending should be permitted to exercise his ministry. And yet we do not find that public disapprobation of his conduct or sentiments has been made by Dr. Geddes's superiors and brethren. His undertaking and dreadful concessions tend to do more injury to revealed religion, than the impudent ribaldry of the ignorant Paine. It therefore by no means redounds to the honour of the Roman-catholic clergy, that they have suffered Dr. Geddes's daring attempt to injure their church in particular, and Christianity in general, without some open manifestation of their displeasure. God forbid that perfection, in any degree, should have an apologist, but the administration of justice is not perfection, and every society ought to declare against any of its members, who, by his writings, attacks the principles upon which that society is founded. If the church is all, and the Bible nothing, this behaviour of Dr. Geddes is not culpable ; but if it is the faith of the Roman-catholic church (as we have no doubt it is), that though the church is infallible, the scriptures were written by inspiration, then this silence with respect to one of their own body is highly censurable. We have dwelt the longer on this particular, because it forms

a curious article in the history of the English Roman-catholic church. We see, hence, what astonishing changes the lapse of a century produces, and particularly a revolution so extensive as that of France. The Roman church has been wounded in her vitals ; and though we pity the base treatment of the venerable Pius VI. and the undeserved sufferings of the Gallican clergy, yet it is impossible for a Protestant not to see in all this a direction super-human. The sacred predilections have been unfolded herein, and are evidently fulfilling every day ; so that the infidelity by which this is in a great part accomplished, must stagger and fall before the irresistible evidence of prophecy.

The author of the Pursuits of Literature, and some other writers, have complained of the encouragement which has been given to the Roman-catholic clergy in this country. But this is unmanly and ungenerous. There can be little reason to apprehend that popery will gain converts in this enlightened kingdom, and the catholics themselves can have no inducement to prompt them to make such. They can have no hopes of seeing their church recovering its ancient splendour, since even in Italy itself, the peculiar feat of its glory, the energy of their religious orders is extinguished. The fall of the Jesuits was the prelude to the destruction of the papal power, which followed very fast upon that memorable event.

The generous treatment which the persecuted clergy of France have met with here, cannot but affect their natures, and their long residence among us must have softened down what prejudices they may have once had against our religion. Should peace and order be restored in their country, a mutual good-will between the two nations must be the consequence, and then Protestantism there will greatly flourish. Infidelity is but of temporary duration. Men may be pleased with it for a short season, while their passions are violently exercised ; but in the cool hour of reflection, and at those periods when strength of mind is requisite, they will have recourse to religion, if it is calculated to support them, and is within their reach. We see, therefore, much ground for expecting a great outspread of religious truth over scepticism, heresy, and superstition of every kind ; nor is it, perhaps, too much to say, that this change will be materially affected by the extensive influence of our own country.

CHURCH-STRETTON, a town of Shropshire, with a market on Thursday. It is fourteen miles S. of Shrewsbury. Long. 2. 46. W. Lat. 52. 32. N.

CHURCHILL FORT, on the E. side of Hudson's Bay, in North America, the most northerly of those belonging to that company. Long. 94. 3. W. Lat. 58. 48. N.

CHURN (*Encycl.*) The inferiority of the churns in common use has induced several ingenious mechanics to exert their skill in contriving others, that would render the process of making butter less tedious and expensive. Of these we have already given some proofs, particularly in the description of Mr. Bowler's improved churn. We shall here present the reader with an account of a butter-churn, constructed on a new principle, by Mr. Harland, of Fenchurch-street, London.

The barrel-churn, delineated in Plate 20, is moved by the intervention of a multiplying wheel, to moderate its too violent motion. The head of the crank in the mortise (in the handle) effects the rotatory motion of the barrel with great facility. And if the barrel be fixed, and the axis (in the inside), to which the dashers are attached, be made to turn, the butter will be more speedily formed. A fly-wheel is also affixed, by means of which the agitation of the cream is necessarily performed in a more uniform manner ; and, consequently, the butter will be more perfectly separated from the whey.

As butter is often made in small quantities, and the vertical motion of the common churn is extremely fatiguing, we con-

sider these methods of applying the powers of mechanism, as valuable improvements. Hence we presume to recommend the preceding improved butter-churn to be generally introduced; for the facility and expedition, with which butter is thus obtained, will amply compensate the additional expence.

If a pump-churn be employed, it may be plunged a foot deep in a tub of cold water, and remain there during the whole time of churning, which will harden the butter in a considerable degree. This operation may be much facilitated by pouring into the churn a small quantity of distilled vinegar, which will produce butter in the course of one hour. Those who make use of a pump-churn, should endeavour to keep up a regular motion of the machine; and by no means admit any person to assist them, unless from absolute necessity: for, if the churning be irregularly performed, the butter will in winter go back; and, if the agitation be more quick, and violent in summer, it will cause the butter to ferment, and thus to acquire a very disagreeable flavour.—Where there are many cows, a barrel-churn is preferred; but unless it be kept very clean, the bad effects of it will be soon discovered in the butter. Particular care should also be taken to place it in a proper temperature, according to the change of the season; that is, to fix it in a warmer situation in the winter, and in the summer to expose it to a free current of air.

CHUSAN, an island on the E. coast of China, where the East-India company had once a factory. Long. 124. o. E. Lat. 30. o. N.

CIAMPA, a kingdom of Asia, bounded on the E. and S. by the Indian Ocean, on the N. by Cochinchina, and on the W. by Cambodia.

CILICIA (*Encycl.*). According to Josephus, Cilicia was first peopled by Tarhish the son of Javan, and his descendants, whence the whole country was named *Tarhis*. The ancient inhabitants were in process of time driven out by a colony of Phœnicians, who, under the conduct of *Cilix*, first settled in the island of Cyprus, and from thence passed into the country which, from the leader, they called *Cilicia*. Afterwards, several other colonies from different nations settled in this kingdom, particularly from Syria and Greece; whence the Cilicians in some places used the Greek tongue, in others the Syriac; but the former greatly corrupted by the Persian, the predominant language of the country being a dialect of that tongue. We find no mention of the kings of Cilicia after their settlement in that country, till the time of Cyrus, to whom they voluntarily submitted, continuing subject to the Persians till the overthrow of that empire; but governed to the time of Artaxerxes Mnemon, by kings of their own nation. After the downfall of the Persian empire, Cilicia became a province of that of Macedon; and, on the death of Alexander, fell to the share of Seleucus, and continued under his descendants till it was reduced to a Roman province by Pompey. As a provincial province, it was first governed by Appius Claudius Pulcher; and after him by Cicero, who reduced several strong holds on Mount Amanus, in which some Cilicians had fortified themselves, and held out against his predecessor. It was on this occasion that the division, formerly mentioned, into Trachæa and Campestris, took place. The latter became a Roman province; but the former was governed by kings appointed by the Romans, till the reign of Vespasian, when the family of Tracondementus being extinct, this part also made a province of the empire, and the whole divided into Cilicia *Prima*, Cilicia *Secunda*, and Isauria; the first took in all Cilicia Campestris, the second the coast of Cilicia Trachæa, and the last the inland parts of the same division. It is now a province of Asiatic Turkey; and is called *Caramania*, having been the last province of the Caramanian kingdom which held out against the Ottoman race.

That part of Cilicia called by the ancients *Cilicia Campestris*, was, if we believe Ammianus Marcellinus, one of the most fruitful countries of Asia; but the western part equally barren, though famous, even to this day, for an excellent breed of horses, of which 600 are yearly sent to Constantinople for the especial use of the grand-signior. The air in the inland parts is reckoned wholesome; but that on the sea-coast very dangerous, especially to strangers.

The rivers of any note are the Pyramus, which rises on the north side of mount Taurus, and empties itself into the Mediterranean between Iffius and Magarus; the Cydnus springs from the Antitaurus, passes through Tarsus, and dilembogues itself into the Mediterranean. It is famous for the rapidity of its stream, and the coldness of its waters, which proved very dangerous to Alexander the Great.

CIMBRI (*Encycl.*). This ancient Celtic nation, about 113 years before Christ, left their peninsula with their wives and children; and joining the Teutones, a neighbouring nation, took their journey southward in quest of a better country. They first fell upon the Boii, a Gaulish nation situated near the Hercynian forest. Here they were repulsed, and obliged to move nearer the Roman provinces. The republic being then alarmed at the approach of such multitudes of barbarians, sent an army against them under the consul Papirius Carbo. On the approach of the Roman army, the Cimbri made proposals of peace. The consul pretended to accept it; but having thrown them into a disadvantageous situation, treacherously attacked their camp. His perfidy was rewarded as it deserved; the Cimbri ran to arms, and not only repulsed the Romans, but, attacking them in their turn, utterly defeated them, and obliged the flattered remains of their forces to conceal themselves in the neighbouring forests. After this victory, the Cimbri entered Transalpine Gaul, which they quickly filled with slaughter and desolation. Here they continued five or six years; when another Roman army under the consul Silanus marched against them. This general met with no better success than Carbo had done. His army was routed at the first onset; in consequence of which, all Narbonne Gaul was exposed at once to the ravages of these barbarians.

About 105 years before Christ, the Cimbri began to threaten the Roman empire itself with destruction. The Gauls marched from all parts with a design to join them, and to invade Italy. The Roman army was commanded by the proconsul Cæpio, and the consul Mallius; but as these two commanders could not agree, they were advised to separate, and divide their forces. This advice proved the ruin of the whole army. The Cimbri immediately fell upon a strong detachment of the consular army commanded by M. Aurelius Scaurus, which they cut off to a man, and made Scaurus himself prisoner. Mallius being greatly intimidated by this defeat, desired a reconciliation with Cæpio, but was haughtily refused. He moved nearer the consul, however, with his army, that the enemy might not be defeated without his having a share in the action. The Cimbri, by this movement, imagining the commanders had made up their quarrel, sent ambassadors to Mallius with proposals of peace. As they could not help going through Cæpio's camp, he ordered them to be brought before him; but finding they were empowered to treat only with Mallius, he could scarce be restrained from putting them to death. His troops, however, forced him to confer with Mallius about the proposals sent by the barbarians: but as Cæpio went to the consul's tent against his will, so he opposed him in every thing; contradicted with great obliquity, and insulted him in the grossest manner. The deputies on their return acquainted their countrymen that the misunderstanding between the Roman commanders still subsisted; upon which the Cimbri attacked the camp of Cæpio, and the Gauls

that of Mallius. Both were forced, and the Romans slaughtered without mercy. Eighty thousand citizens and allies of Rome, with 40,000 servants and sutlers, perished on that fatal day. In short, of the two Roman armies only ten men, with the two generals, escaped to carry the news of so dreadful a defeat. The conquerors destroyed all the spoil, pursuant to a vow they had made before the battle. The gold and silver they threw into the Rhone, drowned the horses they had taken, and put to death all the prisoners.

The Romans were thrown into the utmost consternation on the news of so terrible an overthrow. They saw themselves threatened with a deluge of Cimbri and Gauls, numerous enough to over-run the whole country. They did not, however, despair. A new army was raised with incredible expedition; no citizen whatever who was fit to bear arms being exempted. On this occasion also, fencing-masters were first introduced into the Roman camp, by which means the soldiers were soon rendered in a manner invincible. Marius, who was at that time in high reputation on account of his victories in Africa, was chosen commander, and waited for the Cimbri in Transalpine Gaul: but they had resolved to enter Italy by two different ways; the Cimbri over the eastern, and the Teutones and other allies over the western Alps. The Roman general therefore marched to oppose the latter, and defeated the Ambrones and Teutones with great slaughter. The Cimbri, in the mean time, entered Italy, and struck the whole country with terror. Catulus and Sylla attempted to oppose them; but their soldiers were so intimidated by the fierce countenances and terrible appearance of these barbarians, that nothing could prevent their flying before them. The city of Rome was now totally defenceless; and, had the Cimbri only marched briskly forwards, they had undoubtedly become masters of it; but they waited in expectation of being joined by their allies the Ambrones and Teutones, not having heard of their defeat by Marius, till the senate had time to recal him to the defence of his country. By their order he joined his army to that of Catulus and Sylla; and upon that union was declared commander-in-chief. The Roman army consisted of 52,300 men. The cavalry of the Cimbri were no more than 15,000, but their foot seemed innumerable; for, being drawn up in a square, they are said to have covered thirty furlongs. The Cimbri attacked the Romans with the utmost fury; but, being unaccustomed to bear the heats of Italy, they soon began to lose their strength, and were easily overcome. But they had put it out of their power to fly; for, that they might keep their ranks the better, they had, like true barbarians, tied themselves together with cords fastened to their belts, so that the Romans made a most terrible havoc of them. The battle was therefore soon over, and the whole day employed only in the most terrible butchery. An hundred and twenty thousand were killed on the field of battle, and 60,000 taken prisoners. The victorious Romans then marched to the enemy's camp; where they had a new battle to fight with the women, whom they found more fierce than even their husbands had been. From their carts and waggons, which formed a kind of fortification, they discharged showers of darts and arrows on friends and foes without distinction. Then they first suffocated their children in their arms, and afterwards put an end to their own lives. The greatest part of them hanged themselves on trees. One was found hanging at a cart with two of her children at her heels. Many of the men, for want of trees and stakes, tied strings in running knots about their necks, and fastened them to the tails of their horses, and the horns and feet of their oxen. In order to strangle themselves that way; and thus the whole multitude was destroyed.

The country of the Cimbri, which, after this terrible cata-

strophe, was left a mere desert, was again peopled by the Scythians; who, being driven by Pompey out of that vast space between the Euxine and the Caspian sea, marched towards the north and west of Europe, subduing all the nations they met with in their way. They conquered Russia, Saxony, Westphalia, and other countries as far as Finland, Norway, and Sweden. It is pretended that Wodin their leader travelled for many countries, and endeavoured to subdue them only with a view to excite the people against the Romans; and that the spirit of animosity which he had excited operated so powerfully after his death, that the northern nations combined to attack it, and never ceased their incursions till it was totally subverted.

CIMBRISHAM, a sea-port of Schonen, in Sweden. Long. 15. 30. E. Lat. 56. 40. N.

CIRCARS, NORTHERN, five provinces on the bay of Bengal. They were originally denominated *Northern* from their position in respect to Madras, on which they depend. Of these Circars, Cicacole, Rajamundry, Ellore, and Condapilly, are in the possession of the English; and Gunttoo belongs to the Nizam of the Deccan. The first four occupy the sea-coast, from the Chilkla Lake, on the confines of Cattack, to the N. bank of the Kistna; forming a narrow slip of country 350 miles long, and from 26 to 75 broad. It is easily defensible against an Indian enemy, having mountains and extensive forests on one side, and the sea on the other; the extremities only being open. Its greatest defect is in point of relative situation to Bengal and Madras, it being 350 miles from the first, and 250 from the latter; so that the troops destined to protect it cannot be depended on, for any pressing service that may arise in either presidency. The English Circars had been ceded to the French, by the Nizam of the Deccan, in 1753; but they were conquered by Colonel Clive in 1759, and now produce an annual revenue of 360,000*l*. That of Gunttoo is 70,000*l*.

CIRCUMDUCTION, in Scots law. When parties in a suit are allowed a proof of allegiances; after the time limited by the judge for taking that proof is elapsed, either party may apply for circumduction of the time of proving; the effect of which is, that no proof can afterwards be brought, and the course must be determined as it stood when circumduction was obtained.

CIRENZA (*Encycl.*), erroneously spelt CIRENZIA.

CITTADELLA, a sea-port and capital of Minorca, on the W. side of that island. Long. 3. 34. E. Lat. 39. 54. N.

CITTA-DI-CASTELLO, a populous town of Italy, capital of a county of the same name, in Umbria, with a bishop's see. It is seated on the river Tiber, twenty-seven miles S.W. of Urbino. Long. 12. 18. E. Lat. 43. 32. N.

CITTA-NUOVA, a town of Italy, in the marquise of Ancona, seated on the sea-shore, and containing sixteen churches and convents, within its walls, besides fifteen without. It is ten miles from Loreto. Long. 13. 46. E. Lat. 43. 16. N.

CITTA-NUOVA, a small sea-port of Istria, in the territory of Venice, with a bishop's see, sixty miles E. of Venice. Long. 14. 2. E. Lat. 45. 36. N.

CITTA-NUOVA-COTTONERA, a fortified town in the island of Malta, including the port of St. Margarita.

CITTA-VITTORIOSA, or IL BORGO, a strong town in the island of Malta, seated on a narrow neck of land in the harbour, to the left of Valetta, from which, on each side of the town, runs a broad canal inclosing the town, and forming an excellent harbour. It is defended by the castle of St. Angelo, on a high rock, joined to the town by a bridge. Long. 14. 34. E. Lat. 35. 54. N.

CIVITA, TURCHINO (*Encycl.*). On the south-east side of Civita Turchino runs the ridge of a hill which unites it to

Corneto. This ridge is at least three or four miles in length, and almost entirely covered with artificial hillocks, called by the inhabitants *monti rotti*. About twelve of these hillocks have at different times been opened; and in every one of them have been found several subterranean apartments cut out of the solid rock. These apartments are of various forms and dimensions: some consist of a large outer room, and a small one within; others of a small room at the first entrance, and a large one within: others are supported by a column of the solid rock left in the centre, with openings on every part. The entrance to them all is by a door about five feet high, by two and a half broad. Some of them have no light but from the door, while others seem to have had a small light from above, through a hole of a pyramidal form. Many of these apartments have an elevated port that runs all round the wall, being a part of the rock left for that purpose. The moveables found in these apartments consist chiefly of Etruscan vases of various forms: in some indeed have been found some plain sarcophagi of stone, with bones in them. The whole of these apartments are stuccoed, and ornamented in various manners: some indeed are plain; but others, particularly three, are richly adorned, having a double row of Etruscan inscriptions running round the upper part of the walls, and under them a kind of frieze of figures in painting: some have an ornament under the figures, which seems to supply the place of an architrave. The paintings seem to be in fresco; and in general resemble those which are usually seen upon Etruscan vases; though some of them are perhaps superior to any thing as yet seen of the Etruscan art in painting. In general they are flight, but well conceived; and prove, that the artist was capable of producing things more studied and better finished; though in such a subterranean situation, the delicacy of a finished work would in a great measure have been thrown away. It is probable, however, that among the immense number of these apartments that yet remain to be opened, many paintings and inscriptions may be found sufficient to form a very useful and entertaining work.

CLAIR, Sr. a lake of North America, half way between the lakes Huron and Erie, about ninety miles in circumference. It receives the waters of the great lakes Superior, Michigan, and Huron, and discharges them through the strait called Detroit, into lake Erie.

CLAMECI, a town of France, in the department of Nièvre and late province of Nivernois. Before the late revolution, the chapel of an hospital in the suburb was the provision for the bishopric of Bethlehem, founded in 1180, when Guy count of Nevers gave an asylum, in this place, to a Latin bishop of Bethlehem, who had been driven from the Holy Land by the Saracens. Clameci is seated at the confluence of the Beuvron and Yonne, 112 miles S. by E. of Paris. Long. 3. 36. E. Lat. 47. 28. N.

CLAPHAM, a village in Surrey, containing many handsome villas, which chiefly surround a beautiful common. In the old parish church, divine service is performed at funerals only; an elegant new church having been erected on the common, but without an adjoining cemetery. Clapham is three miles S.W. by S. of London.

CLARA, Sr. a small island of South America, in Peru, in the bay of Guaiquil, seventy miles S.W. of Guaiquil. Long. 82. 20. W. Lat. 2. 20. S.

CLARENDON, a village three miles E. of Salisbury, where Henry II. summoned a council of the barons and prelates, in 1164, who enacted the laws called the Constitutions of Clarendon; and here were two palaces built by King John.

CLARENS, or **CHATILLARD**, a village of Switzerland, in the Pays de Vaud, celebrated as the principal scene of Rousseau's *Eloïse*. It is delightfully situated, not far from Vevey,

on an eminence, whose gentle declivity slopes gradually toward the lake of Geneva. It commands a view of that majestic body of water, its fertile borders, and the bold rocks and Alps of Savoy. The adjacent scenery consists of vineyards, fields of corn and pasture, and rich groves of oak, ash, and Spanish chestnut trees. "Although the situation and environs," says Mr. Coke, "harmonize with the animated scenery in the *Eloïse* of Rousseau, yet the castle by no means accords with the description in the same work. The traveller sees an oblong building with ancient towers and a pantheone roof; in the inside, a large hall that looks like a prison; and the whole bears rather the antiquated appearance of a feudal mansion, inhabited by some turbulent baron, than the residence of the elegant and impassioned Julia."

CLARINETTE, or **CLARINET**, a kind of trumpet made of box-wood, whole tube is narrower and its tone acuter than that of the common trumpet. A patent was lately granted to Messrs. Goulding and Co. of Pall-Mall, for an improved clarinet. The patentees line the instrument with a timed brass tube calculated to preserve the wood and improve the tone. To remedy the inconvenience from the leatherings of the keys being spoiled and out of order; they line the holes with a metal tube, ground to perfect flatness at the outside orifice, and rendered air-tight by a properly contrived stopper.

CLARKE (Samuel), D. D. a preacher and writer of considerable note in the reign of Charles II. was, during the inter-regnum, and at the time of the ejection, minister of St. Bennet Pank in London. In November 1660, he, in the name of the Presbyterian ministers, presented an address of thanks to the king for his declaration of liberty of conscience. He was one of the commissioners of the Savoy; and behaved on that occasion with great prudence and moderation. He sometimes attended the church as a hearer and communicant; and was much esteemed by all that knew him, for his great probity and industry. The most valuable of his numerous works are said to be his *Lives of the Puritan Divines* and other persons of note, twenty-two of which are printed in his *martryology*; the rest are in his *Lives of sundry Eminent Persons* in this latter Age, folio; and in his *Marrow of Ecclesiastical History*, in folio and quarto. He died in 1680.

CLARKE (Samuel), the son of the former, was fellow of Pembroke-hall, in Cambridge; but was ejected from his fellowship for refusing to take the engagements, as he was also afterwards from his rectory of Grendon in Buckinghamshire. He applied himself early to the study of the Scriptures; and his annotations on the Bible, printed together with the sacred text, is highly commended by Dr. Owen, Mr. Baxter, and Dr. Calamy. He died in 1701, aged seventy-five.

CLAUBERGE (John), a learned professor of philosophy and divinity at Duisburg, was born at Solingen in 1622. He travelled into Holland, France, and England, and in each country obtained the esteem of the learned. The Elector of Brandenburg gave him public testimonies of his esteem. He died in 1665. His works were printed at Amsterdam in two volumes 4to. The most celebrated of these is his treatise entitled *Logica vetus et nova*, &c.

CLAUDE (John), a Protestant divine, born in the province of Angoumois in 1619. Mef. de Port Royal using their utmost endeavours to convert M. de Turenne to the Catholic faith, presented him with a piece calculated to that end, which his lady engaged Mr. Claude to answer; and his performance gave rise to the most famous controversy that was ever carried on in France between the Roman-catholics and Protestants. On the revocation of the edict of Nantz, he retired to Holland, where he met with a kind reception, and was honoured with a considerable pension by the Prince of Orange. He died in 1687; and left a son Isaac Claude, whom he lived to see

minister of the Walloon church at the Hague, and who published several excellent works of his deceased father.

CLAUDE, *St.* a handsome town of France, in the department of Jura and late province of Franche Comté, with a bishop's see. It is seated between three high mountains, on the river Lison, and owes its origin to a celebrated abbey, built in the year 425, in this then barren and uninhabited country. This abbey had the pious privilege of legitimating bastards, and could confer nobility and pardon criminals, till the year 1742, when it was erected into a bishopric, and its Benedictine monks were metamorphosed into noble canons. The cathedral is extremely elegant. Great numbers of pilgrims have flocked hither, to visit the remains of the body of St. Claude, which they pretend are yet uncorrupted. In this city are many public fountains with large basins. It is 35 miles N.W. of Geneva. Long. 6. 18. E. Lat. 46. 24. N. From Mount St. Claude, which forms part of Mount Jura, is a fine prospect over Switzerland and Savoy, the lake and town of Geneva, and the Pays de Vaud.

CLAUDIUS (Claudius) (*Encycl.*). It is not agreed of what country he was a native; but he came to Rome in the year of Christ 365, when he was about thirty years old; and there insinuated himself into Stilicho's favour; who being a person of great abilities both for civil and military affairs, though a Gothic by birth, was so considerable a person under Honorius, that he may be said for many years to have governed the western empire. Stilicho afterwards fell into disgrace, and was put to death; and it is more than probable that the poet was involved in the misfortunes of his patron, and severely persecuted in his person and fortunes by Hadrian, an Egyptian by birth, who was captain of the guards to Honorius, and succeeded Stilicho. There is reason, however, to think that he rose afterwards to great favour; and obtained several honours both civil and military. The Princess Serena had a great esteem for Claudian, and recommended and married him to a lady of great quality and fortune in Lybia. There are a few little poems on sacred subjects, which through mistake have been ascribed by some critics to Claudian; and so have made him be thought a Christian. But St. Austin, who was contemporary with him, expressly says, that he was a Heathen. The time of Claudian's death is uncertain, nor do we know any further particulars of his life than what are to be collected from his works, and which we have already related above. He is thought to have more of Virgil in his style than all the other imitators of that poet.

CLAUDIUS I. Roman emperor, *A.D.* 41. The beginning of his reign was very promising; but it was soon discovered that little better than an idiot filled the throne, who might easily be made a tyrant: accordingly he became a very cruel one, through the influence of his empress, the infamous Messalina: after her death, he married his niece Agrippina, who caused him to be poisoned to make way for Nero, *A.D.* 54.

CLAUDIUS II. (Aurelius), surnamed *Gothicus*, signified himself by his courage and prudence under the reigns of Valerian and Julian; and on the death of the latter was declared emperor in 268. He put to death Aureolus, the murderer of Galienus; defeated the Germans; and in 269 marched against the Goths, who ravaged the empire with an army of 300,000 men, which he at first harassed, and the next year entirely defeated: but a contagious disease, which had spread through that vast army, was caught by the Romans; and the emperor himself died of it a short time after, aged fifty-six. Pollio says that this prince had the moderation of Augustus, the virtue of Trajan, and the piety of Antoninus.

CLEAR, CAPE, a promontory of a little island on the S. of Ireland. Long. 11. 10. W. Lat. 51. 18. N.

VOL. X.

CLEBURY, a town of Shropshire, with a market on Thursday. It is seated on the river Lea, twenty-eight miles S.E. of Shrewsbury. Long. 2. 23. W. Lat. 52. 21. N.

CLEMENS ROMANUS, bishop of Rome, where he is said to have been born; and to have been fellow-labourer with St. Peter and St. Paul. We have nothing remaining of his works that is clearly genuine, excepting one epistle, written to quiet some disturbances in the church of Corinth; which, next to holy writ, is esteemed one of the most valuable remains of ecclesiastical antiquity.

CLEMENS Alexandrianus, so called to distinguish him from the former, was an eminent father of the church, who flourished at the end of the second and beginning of the third centuries. He was the scholar of Pantaenus, and the instructor of Origen. The best edition of his works is that in two vols. folio, published in 1715 by Archbishop Potter.

CLEMENT V. (Pope), the first who made a public sale of indulgences. He transplanted the holy see to Avignon in France; greatly contributed to the suppression of the knights templars; and was author of a compilation of the decrees of the general councils of Vienna, styled *Clementines*. He died in 1314.

CLEMENT VII. (Julius de Medicis), Pope, memorable for his refusing to divorce Catharine of Arragon from Henry VIII; and for the bull he published upon the king's marriage with Anne Boleyn; which, according to the Romish authors, lost him England. He died in 1534.

CLEMENT XIV. (Francis Laurentius Ganganelli), the late pope's predecessor, was born at St. Angelo in the duchy of Urbino, in 1705; and chosen pope, though not yet a bishop, in 1769; at which time the see of Rome was involved in a most disagreeable and dangerous contest with the house of Bourbon. His reign was rendered troublesome by the collision of parties on the affairs of the Jesuits; and it is pretended that his latter days were embittered by the apprehensions of poison. Though this report was probably apocryphal, it is said that he often complained of the heavy burthen which he was obliged to bear; and regretted, with great sensibility, the loss of that tranquillity which he enjoyed in his retirement when only a simple Franciscan. He was, however, fortunate in having an opportunity, by a single act, to distinguish a short administration of five years in such a manner as will ever prevent its sinking into obscurity. His death was immediately attributed to poison, as if an old man of seventy, loaded with infirmities and disorders, could not quit the world without violence. His proceedings against the Jesuits furnished a plausible pretence for this charge; and the malevolence of their enemies embellished it with circumstances. It even seems as if the ministers of those powers who had procured their dissolution did not think it beneath them to countenance the report; as if falsehood was necessary to prevent the revival of a body which had already sunk in its full strength, under the weight of real misconduct. The charge was the more ridiculous, as the pontiff had undergone a long and painful illness, which originally proceeded from a suppression of urine, to which he was subject; yet the report was propagated with the greatest industry: and though the French and Spanish ministers were present at the opening of his body, the most horrible circumstances were published relative to that operation. It was confidently told that the head fell off from the body, and that the stench poisoned and killed the operators. It availed but little that the operators shewed themselves alive and in good health, and that the surgeons and physicians proved the falsehood of every part of the report. Clement XIV. appears to have been a man of a virtuous character, and possessed of considerable abilities. He died much regretted by his subjects.

61

CLEORULUS, son of Evagoras, and one of the Grecian sages; he was valiant, a lover of learning, and an enemy to vice. Flourished about 560 years before Christ.

CLERAC, or **CLAIRAC**, a town of France, in the department of Lot and Garonne, and late province of Guenre. It is seated on the river Lot, ten miles from Agen. Long. o. 33. E. Lat. 44. 20. N.

CLERGY, BENEFIT OF. This ancient privilege having been treated too concisely in our original article, we here propose to treat the subject more at length.

After trial and conviction of a criminal, the judgment of the court regularly follows, unless suspended or arrested by some intervening circumstance; of which the principal is *benefit of clergy*: a title of no small curiosity as well as use; and concerning which, therefore, it may not be improper to enquire, 1. Into its original, and the various mutations which this privilege of the clergy has sustained; 2. To what persons it is to be allowed at this day; 3. In what cases; 4. The consequences of allowing it.

1. *Clergy, the privilegium clericale*, or (in common speech) the benefit of clergy, had its original from the pious regard paid by Christian princes to the church in its infant state, and the ill use which the popish ecclesiastics soon made of that pious regard. The exemptions which they granted to the church were principally of two kinds: 1. Exemption of places consecrated to religious duties from criminal arrests; which was the foundation of sanctuaries: 2. Exemption of the persons of clergymen from criminal process before the secular judge in a few particular cases; which was the true original and meaning of the *privilegium clericale*.

But the clergy increasing in wealth, power, honour, number, and interest, soon began to set up for themselves; and that which they obtained by the favour of the civil government, they now claimed as their inherent right, and as a right of the highest nature, indefeasible, and *jure divino*. By their canons, therefore, and constitutions, they endeavoured at, and where they met with early princes, obtained, a vast extension of those exemptions; as well in regard to the crimes themselves, of which the list became quite universal, as in regard to the persons exempted, among whom were at length comprehended, not only every little subordinate officer belonging to the church or clergy, but even many that were totally laymen.

In England, however, although the usurpations of the pope were very many and grievous, till Henry VIII. totally exterminated his supremacy, yet a total exemption of the clergy from secular jurisdiction could never be thoroughly effected, though often endeavoured by the clergy; and therefore, though the ancient *privilegium clericale* was in some capital cases, yet it was not universally, allowed. And in those particular cases, the use was, for the bishop or ordinary to demand his clerks to be remitted out of the king's courts as soon as they were indicted: concerning the allowance of which demand there was for many years a great uncertainty; till at length it was finally settled in the reign of Henry VI. that the prisoner should first be arraigned; and might either then claim his benefit of clergy by way of declinatory plea, or, after conviction, by way of arrest of judgment. This latter way is most usually practised, as it is more to the satisfaction of the court to have the crime previously ascertained by confession or the verdict of a jury; and also it is more advantageous to the prisoner himself, who may possibly be acquitted, and so need not the benefit of his clergy at all.

Originally the law was held that no man should be admitted to the benefit of clergy, but such as had the *habitus et tonsuram clericalem*. But, in process of time, a much wider and more comprehensive criterion was established; every one that could

read (a great mark of learning in those days of ignorance and her sister superstition) being accounted a clerk, or *clericus*, and allowed the benefit of clerkship, though neither initiated in clerkship, nor trimmed with the holy tonsure. But when learning, by means of the invention of printing, and other concurrent causes, began to be more generally diffused than formerly; and reading was no longer a competent proof of clerkship, or being in holy orders; it was found that as many laymen as divines were admitted to the *privilegium clericale*; and therefore by statute 4 Hen. VII. c. 13, a distinction was once more drawn between mere lay scholars, and clerks that were really in orders. And, though it was thought reasonable still to mitigate the severity of the law with regard to the former, yet they were not put upon the same footing with actual clergy; being subjected to a slight degree of punishment, and not allowed to claim the clerical privilege more than once. Accordingly the statute directs, that no person, once admitted to the benefit of clergy, shall be admitted thereto a second time, until he produces his orders: and, in order to distinguish their persons, all laymen who are allowed this privilege, shall be burned with a hot iron in the brawn of the left thumb. This distinction between learned laymen and real clerks in orders was abolished for a time by the statutes 28 Hen. VIII. c. 1, and 32 Hen. VIII. c. 3; but is held to have been virtually restored by statute 1 Edw. VI. c. 12, which statute also enacts, that lords of parliament and peers of the realm may have the benefit of their peerage, equivalent to that of clergy, for the first offence (although they cannot read, and without being burnt in the hand), for all offences then clergyable to commoners, and also for the crimes of housebreaking, highway-robbery, horse-stealing, and robbing of churches.

After this burning, the laity, and before it the real clergy, were discharged from the sentence of the law in the king's courts, and delivered over to the ordinary, to be dealt with according to the ecclesiastical canons. Whereupon the ordinary, not satisfied with the proofs adduced in the profane secular court, felt himself formally to make a purgation of the offender by a new canonical trial; although he had been previously convicted by his country, or perhaps by his own confession. This trial was held before the bishop in person, or his deputy; and by a jury of twelve clerks: and there, first, the party himself was required to make oath of his own innocence; next, there was to be the oath of twelve compurgators, who swore they believed he spoke the truth; then, witnesses were to be examined upon oath, but on behalf of the prisoner only; and lastly, the jury were to bring in their verdict upon oath, which usually acquitted the prisoner; otherwise, if a clerk, he was degraded, or put to penance. A learned judge in the beginning of last century remarks, with much indignation, the vast complication of perjury and subornation of perjury in this solemn farce of a mock trial: the witnesses, the compurgators, and the jury, being all of them partakers in the guilt: the delinquent party also, though convicted in the clearest manner, and conscious of his own offence, yet was permitted, and almost compelled, to swear himself not guilty; nor was the good bishop himself, under whose countenance this scene was transacted, by any means exempt from a share of it. And yet, by this purgation, the party was restored to his credit, his liberty, his lands, and his capacity of purchasing a fresh, and was entirely made a new and an innocent man.

This scandalous prostitution of oaths, and the forms of justice, in the almost constant acquittal of felonious clerks by purgation, was the occasion, that, upon very heinous and notorious circumstances of guilt, the temporal courts would not trust the ordinary with the trial of the offender, but delivered

over to him the convicted clerk; *absque purgatione faciendo*: in which situation the clerk convict could not make purgation; but was to continue in prison during life, and was incapable of acquiring any personal property, or receiving the profits of his lands, unless the king should please to pardon him. Both these courses were in some degree exceptionable; the latter perhaps being too rigid, as the former was productive of the most abandoned perjury. As therefore these mock trials took their rise from factious and popish tenets, tending to exempt one part of the nation from the general municipal law, it became high time, when the reformation was thoroughly established, to abolish so vain and impious a ceremony.

Accordingly the statute 18 Eliz. c. 7. enacts, that, for the avoiding such perjuries and abuses, after the offender has been allowed his clergy, he shall not be delivered to the ordinary as formerly; but, upon such allowance, and burning of the hand, he shall forthwith be enlarged and delivered out of prison; with proviso, that the judge may, if he thinks fit, continue the offender in gaol for any time not exceeding a year. And thus the law continued unaltered for above a century; except only, that the statute 21 Jac. I. c. 6. allowed, that women convicted of simple larcenies under the value of 20s. should (not properly have the benefit of clergy, for they were not called upon to read, but) be burned in the hand, whipped, or stocked, or imprisoned for any time not exceeding a year. And a similar indulgence by the statutes 3 and 4 W. and M. c. 9. and 4 and 5 W. and M. c. 24. was extended to women guilty of any clergyable felony whatever; who were allowed once to claim the benefit of the statute, in like manner as men might claim the benefit of clergy, and to be discharged upon being burned in the hand, and imprisoned for any time not exceeding a year. All women, all peers, and all male commoners who could read, were therefore discharged in such felonies absolutely, if clerks in orders; and for the first offence upon burning in the hand, if lay; yet all liable (except peers), if the judge saw occasion, to imprisonment not exceeding a year. And those men who could not read, if under the degree of peerage, were hanged.

Afterwards, indeed, it was considered, that education and learning were no extenuations of guilt, but quite the reverse; and that if the punishment of death for simple felony was too severe for those who had been liberally instructed, it was, *à fortiori*, too severe for the ignorant also. And thereupon, by statute 5 Anne, c. 6. it was enacted, that the benefit of clergy should be granted to all those who were entitled to ask it, without requiring them to read by way of conditional merit. And, experience having shewn that so universal a lenity was frequently inconvenient, and an encouragement to commit the lower degrees of felony; and that though capital punishments were too rigorous for these inferior offences, yet no punishment at all (or next to none, as branding or whipping) was as much too gentle; it was enacted by the same statute, 5 Anne, c. 6. that when any person is convicted of any theft or larceny, and burnt in the hand for the same, he shall, at the discretion of the judge, be committed to the house of correction or public work-house, to be there kept to hard labour for any time not less than six months, and not exceeding two years; with a power of inflicting a double confinement in case of the party's escape from the first. And it is also enacted by the statutes 4 Geo. I. c. 11. and 6 Geo. I. c. 23. that when any persons shall be convicted of any larceny, either grand or petit, or any felonious stealing or taking of money or goods and chattels, either from the person or the house of any other, or in any other manner, and who by the law shall be entitled to the benefit of clergy, and liable only to the penalties of burning in the hand, or whipping, the court, in their

discretion, instead of such burning in the hand, or whipping, may direct such offenders to be transported to America for seven years; and if they return, or are seen at large in this kingdom within that time, it shall be felony without benefit of clergy.

In this state does the benefit of clergy at present stand; very considerably different from its original institution: the wisdom of the English legislature having, in the course of a long and laborious process, extracted, by a noble alchemy, rich medicines out of poisonous ingredients; and converted, by gradual mutations, what was at first an unreasonable exemption of particular popish ecclesiastics, into a merciful mitigation of the general law with respect to capital punishments.

From the whole of this detail, we may collect, that however, in times of ignorance and superstition, that monster in true policy may for a while subsist, of a body of men residing in a state, and yet independent of its laws, yet when learning and rational religion have a little enlightened men's minds, society can no longer endure an absurdity so gross, as must destroy its very fundamentals. For, by the original contract of government, the price of protection by the united force of individuals, is that of obedience to the united will of the community. This united will is declared in the laws of the land: and that united force is exerted in their due, and universal, execution.

II. We are next to enquire, to what persons the benefit of clergy is to be allowed at this day: and this must chiefly be collected from what has been observed in the preceding article. For, upon the whole, we may pronounce, that all clerks in orders are, without any branding, and of course without any transportation (for that is only substituted in lieu of the other), to be admitted to this privilege, and immediately discharged, or at most only confined for one year; and this as often as they offend. Again, all lords of parliament, and peers of the realm, by the statute 1 Edw. VI. c. 12. shall be discharged in all clergyable and other felonies provided for by the act without any burning in the hand, in the same manner as real clerks convict: but this is only for the first offence. Lastly, all the commons of the realm, not in orders, whether male or female, shall, for the first offence, be discharged of the punishment of felonies, within the benefit of clergy, upon being burnt in the hand, and suffering discretionary imprisonment; or, in case of larceny, upon being transported for seven years, if the court shall think proper.

III. The third point to be considered is, for what crimes the *privilegium clericale*, or benefit of clergy, is to be allowed. And it is to be observed, that neither in high treason, nor in petit larceny, nor in any mere misdemeanors, was it indulged at the common law: and therefore we may lay it down as a rule, that it was allowable only in petit treason, and capital felonies; which for the most part became legally entitled to this indulgence, by the statute *de clero*, 25 Edw. III. stat. 3. c. 4. which provides, that clerks convict for treason or felonies, touching other persons than the king himself or his royal majesty, shall have the privilege of holy church. But yet it was not allowed in all cases whatsoever: for in some it was denied even in common law, viz. *infidiatio viarum*, or lying in wait for one on the highway; *depopulatio agrorum*, or destroying and ravaging a country; and *combussio domorum*, or arson, that is, burning of houses; all which are a kind of hostile acts, and in some degree border upon treason. And further, all these identical crimes, together with petit treason, and very many other acts of felony, are ousted of clergy by particular acts of parliament.

Upon the whole, we may observe the following rules. 1. That in all felonies, whether new created, or by common law, clergy is now allowable, unless taken away by act of par-

flament. 2. That where clergy is taken away from the principal, it is not of course taken away from the accessory, unless he be also particularly included in the words of the statute. 3. That when the benefit of clergy is taken away from the offence (as in case of murder, buggery, robbery, rape, and burglary), a principal in the second degree, being present, aiding and abetting the crime, is as well excluded from his clergy as he that is a principal in the first degree: but, 4. That where it is only taken away from the person committing the offence (as in the case of stabbing, or committing larceny in a dwelling-house), his aids and abettors are not excluded, through the tenderness of the law, which hath determined that such statutes shall not be taken literally.

IV. Lastly, We are to enquire what the consequences are to the party, of allowing him this benefit of clergy. We speak not of the branding, imprisonment, or transportation; which are rather concomitant conditions, than consequences, of receiving this indulgence. The consequences are such as affect his present interest, and future credit and capacity: as having been once a felon, but now purged from that guilt by the privilege of clergy; which operates as a kind of statute pardon. And we may observe, 1. That, by his conviction, he forfeits all his goods to the king; which, being once vested in the crown, shall not afterwards be restored to the offender. 2. That, after conviction, and till he receives the judgment of the law by branding or the like, or else is pardoned by the king, he is, to all intents and purposes, a felon; and subject to all the disabilities and other incidents of a felon. 3. That, after burning or pardon, he is discharged for ever of that, and all other felonies before committed, within the benefit of clergy; but not of felonies from which such benefit is excluded: and this, by statutes 8 Eliz. c. 4. and 18 Eliz. c. 7. 4. That, by the burning, or pardon of it, he is restored to all capacities and credits, and the possession of his lands, as if he had never been convicted. 5. That what is said with regard to the advantages of commoners and laymen, subsequent to the burning in the hand, is equally applicable to all peers and clergymen, although never branded at all. For they have the same privileges, without any burning, to which others are entitled after it.

CLERY, a village in France, nine miles S.W. of Orleans, once famous for the pilgrimages to our lady of Clery. Here was the tomb of that monster Lewis XI. who appeared, in white marble, as the faint and the patriot king!

CLEYBROOK, **GREAT** and **LITTLE**, two villages in Leicestershire, on the N.W. side of Lutterworth, supposed to have been a part of Cleycester, situated one mile to the W. which was a flourishing city of the Romans, and where their bricks and coins have been frequently found.

CLIFFE, a town of Northamptonshire, with a market on Tuesday; 30 miles N.E. of Northampton, and 88 N.N.W. of London. Long. 0. 37. W. Lat. 52. 33. N.

CLIFTON, a village of Westmoreland, three miles from Penrith, remarkable for a skirmish between the king's forces and the rebels in 1745, in which the latter had the advantage.

CLIFTON, a village in Gloucestershire, near Bristol, noted for the hot-well in its neighbourhood, upon the Lower Avon, at the foot of St. Vincent's rock.

CLISSA, a fort of Dalmatia, taken from the Turks by the Venetians. It is seated on a craggy mountain, near which is a narrow valley between two steep rocks, through which the road lies from Turkey to Dalmatia. It is six miles N. of Spalato. Long. 17. 31. E. Lat. 44. 10. N.

CLISSON, a town of France, in the department of Lower Loire and late province of Bretagne, on the river Seure, 12 miles S. of Nantz. Long. 1. 28. W. Lat. 47. 1. N.

CLITHERO, a borough in Lancashire, with a market on Saturday. It is seated near Pendil Hill, and is 36 miles S.E. of Lancaster, and 213 N.N.W. of London. Long. 2. 21. W. Lat. 53. 54. N.

CLOSET, a well-known convenience in a house; calculated to deposit safely small articles of domestic economy, or consumption, till they are wanted for use.

Water-Closet, a modern invention, by means of which the vilest of animal functions may be performed in a decent and cleanly manner, and without giving offence to the feelings of others. The following is the specification of the patent granted to Mr. Binns, of Great Barlow-street, Mary-le-bone, for a machine or apparatus, answering the several purposes of a portable water-closet, a bidet, and easy chair, which together are comprised in one third of the space or room occupied by portable water-closets now in use; and which, from its lightness and size, is particularly calculated for travelling or for camps or ships.

"The object of my invention," says Mr. Binns, "is, to remove the complaint made against a portable water-closet (heretofore invented and manufactured by me), on account of its being too bulky for frequent removals, and to increase the utility of these machines, by the addition of a bidet-pan. In my former portable-closets, the back, enclosing the water-cistern, was vertically fixed upon the seat or lower part of the case; in my present invention, the back shuts down upon the seat in the manner of a lid, and thus not only reduces its size to one-third of the dimensions of the former ones, but also renders it more convenient for travelling, and less liable to be injured. This important advantage of folding down the back of the closet upon the seat, I obtain by different means, viz.

"First, By a screw-jointed tube, as particularly delineated in figs. 6 and 7 (see Plate 21.). This tube consists of two angular parts, made of brass or any other proper materials: the end of one part is inserted and secured in the bottom of the water cistern, and the end of the other part is attached to the basin, in the common way of manufacture. The two parts of the tube are firmly connected, by the one screwing into the other, as may be seen in the above-mentioned figures, and serve as a joint for the back to turn upon, in being folded down upon the seat. When the back of the closet is raised, the screw of the tube is perfectly close or home, the extremity of the female screw pressing against a small collar of leather which surrounds the shoulders of the male screw; but when the back is folded down upon the seat, the screw, as being the joint or hinge, relaxes a quarter turn.

"Secondly, By a jointed tube varying from the above, only in being a cock-joint instead of a screw, as described in fig. 7.

"Thirdly, By a sliding-jointed tube of two parts, each forming a curve of a quarter of a circle, as represented in fig. 5, where the back of the closet is shown in the progress of being shut down upon the seat, to exhibit more clearly the manner in which the tube acts. The two parts of the tube are joined to the cistern and basin as the preceding ones, but not so advantageously, for this tube cannot act as a joint or hinge, and requires an accuracy in the manufacture. The above three jointed tubes are applicable to many kinds of machinery.

"Fourthly, By a leather or other flexible or jointed tube, attached to the bottom of the water-cistern and to the side of the basin. The object of my invention may also be obtained, by varying and differently combining the several means hereinbefore described; but I prefer the first or screw-jointed tube, which includes more advantages than can be derived from any of the other methods. These tubes I generally manufacture in brass, or in what is known by the name of cock-metal. The manner in which the bidet-pan is added to the closet, is

WATER CLOSET.

Fig. 1.

Fig. 6.

Fig. 7.

Fig. 8.

Fig. 3.

to simple and obvious, as scarcely to require any other explanation than a reference to figs. 3, 4, and 8. The rim at each end of the bidet-pan rests on the front and back edge of the seat of the closet, immediately over the basin, and is supplied with water from the closet cistern, either by a separate aqueduct from the cistern, or by the same channel through which the water is admitted into the closet basin; and for this purpose an aperture is made in the upper part of the back end of the bidet-pan, sufficiently large to admit the fan of the pan leading into the basin. The latter method I deem best. The pans I usually manufacture in copper, and japan them; but they may be made of other materials, though none are, in my opinion, so well adapted to the purpose as japanned copper.

"In the figures which are annexed to elucidate this specification, I have exhibited and described the whole closet, which contains many parts that are not new, and cannot be considered as included in my present patent. The parts which I claim as my invention, and for which the patent is granted, are the folding down of the back of the closet upon the seat, or by having the back to engage and disengage, whereby the back may be laid down on the seat; or by folding or laying down the back of the closet upon the seat in any manner whatsoever; but more particularly by the different means herein-before described; the screw-jointed tube; the cock-jointed tube; the sliding tube; the tube made of leather, or any other flexible material; the application of the bidet-pan to the water-closet, and the arms or handles to make it serve as an easy chair. These arms or handles are in two parts, joined by a screw near the angle; and one part of the arm, when joined or screwed together, is attached or fixed to the seat of the closet, and the other to the back by means of sliding fastenings; by which means these arms are made to engage and disengage, for the different purposes the closet may be used for; and also for the convenience of packing in the internal part of the closet in travelling."

Explanation of the figures.—Fig. 1. A side view of the water-closet with the back shut down.

Fig. 2. A side view of the closet, with the back raised and secured by two brass arms which slide into the back and seat: for convenience in packing, these arms separate at the angle or elbow. On this side of the bottom of the closet is shewn the door which is opened whenever the soil pan is removed.

Fig. 3. The same view on an enlarged scale. The side of the case is omitted for the purpose of exhibiting the mechanism. *a.* The frame or case containing the mechanism. *b.* The water-cistern in the back of the closet. *c.* The lever which raises the valve *f*, for the purpose of admitting water through the jointed tube into the basin or bidet-pan. This lever is raised either by drawing up the handle *d*, on the seat, or by pressing the thumb on the extremity of the lever, as appears more plainly at *c*, in fig. 4. In doing the former, not only water is admitted into the basin or bidet, but also the water in the basin is at the same time discharged into the soil-pan below, by means of the tumbler *e*, which opens a valve at the bottom of the basin; but a pressure on the lever at the top of the back produces only a single motion for discharging water out of the cistern. *g.* The screw-jointed tube more particularly described in figs. 6 and 7. *h.* The bidet-pan, which rests at each end upon the edge of the seat over the basin (see also figs. 4 and 8). *i.* The closet basin. *j.* The water-pipe. *k.* The trench-pan. *l.* The soil-pan which contains the foul water, &c. discharged by the basin. The mouth of this pan is closely attached to the pipe at the bottom of the trap, by the angular lever *m*, which is raised and secured by the brass spring catch *n*. When the pan is to be removed, a slight pressure on the knob of the catch

disengages the lever, and the pan which is supported by *h*. In drawing out the soil-pan to discharge its contents, a lid is secured on the mouth of it to prevent the escape of any offensive effluvia in the removal. *o.* The fan at the end of the pipe or tube for admitting water into the basin and bidet-pan. *p.* The top of the back is a lid, which is opened whenever the cistern is supplied with water. The other parts of the figure are either too obvious or too well known to require explanation.

Fig. 4. A view of the seat of the closet, and of the top of the back when the lid is open. *q.* The aperture through which the water is poured into the cistern. *r.* The spring of the lever *c*. *s.* The brass plate affixed to the lower part of the screw-jointed tube, and which is secured to the seat by four screws as a joint. The other references are explained by the same letters in fig. 3.

Fig. 5. A section of the sliding curved tube. *a.* The lower or external part of the tube, which is attached to the basin. *b.* The upper or internal part of the tube, inserted in the bottom of the cistern. *c.* These lines delineate the bottom and front side of the water-cistern. *d.* An outline of the fore-part of the back, and of the seat of the closet. *e.* The joint which connects the back of the closet with the seat. *f.* A collar of leather, against which the shoulder of the upper part of the tube and the extremity of the lower one press, when the tube is closed by the back of the closet being erect. *g.* The valve in the upper or internal part of the tube, for retaining the water in the cistern. *h.* The leather lining to the valve. *i.* The screw which binds the leather to the valve. *j.* A wire to regulate the valve in its motions. In the upper part of this wire is affixed another, which communicates to the lever at the top of the water-cistern. *k.* A fixed bar in which the regulator of the valve moves.

Fig. 6. A vertical section of the screw-jointed tube. *l.* A brass plate affixed to the lower part of the tube, and which is screwed down upon the seat, as appears in fig. 4. The other references are explained by those of the preceding figure.

N. B. This section is not in a direct line, but a combination of three, as shewn by the transverse dotted lines in the following figure.

Fig. 7. A horizontal section of the screw or cock-jointed tube. *m.* The vertical dotted lines point out the variation, in connecting the two parts of the tube by a cock-joint instead of a screw. The other references are explained by those in figs. 5 and 6.

In this section the upper part of the tube is more highly coloured than the lower one, for the purpose of delineating more obviously the outline of the two parts.

Fig. 8. A vertical view of the back part of the bidet-pan when fixed, as in fig. 4.

1. The upper part of the edge of the seat of the closet above the bidet-pan.

2. The rim of the end of the bidet-pan resting on the edge of the seat, which for that purpose is bevelled from the dotted line upwards.

3. The water-pipe or tube at the back of the fan.

4. The fan which disperses the water from all parts of its curvature; an improvement by which the bottom as well as the sides are completely washed.

5. The edges of the aperture in the back part of the bidet-pan, for admitting the fan. These edges of the aperture closely join to the internal surface of the basin, and thus include the whole of the fan in the bidet-pan, when it is placed upon the seat of the closet, as represented in fig. 4.

There are water-closets on other principles, but the above seems to be calculated for every convenience that can be desired
CLOUD, Sr. a town of France, four miles from Paris,
6 K

feated on the river Seine. Here was lately a magnificent royal palace, gardens, cascade, &c.

CLOVIS I. the real founder of the French monarchy. For he was the first conqueror of the several provinces of Gaul possessed before his time by the Romans, Germans, and Goths: these he united to the then scanty dominions of France, removed the seat of government from Soissons to Paris, and made this the capital of his new kingdom. He died in 511, in the 46th year of his age, and 31st of his reign.

CLUSE, a town of Savoy, in the territory of Faucigny; seated on the river Arve, 22 miles S.E. of Geneva. Long. 6. 29. E. Lat. 45. 57. N.

CLWYD, a celebrated vale of Denbighshire, extending from its upper end to the sea above 20 miles; its breadth varying from three to eight, according to the approach or recess of the high mountains inclosing it, through which, in different parts, are gaps formed by nature for entrances. This delightful spot is in a high state of cultivation, even far up the ascent of the hills, and is full of towns, villages, and gentlemen's seats. A river of the same name runs along this vale, the inhabitants of which are remarkable for retaining their vivacity to a very late period of life.

CLWYD, a river of Denbighshire, which rises in the middle of the county, and taking a compass to the S.E. turns to the N.W. and having entered Flintshire, falls into the Irish Sea.

CLYDESDALE, a wild district in the S. part of Lanarkshire in Scotland. Amid the mountains here, particles of gold have sometimes been found washed down by the rains and streams of water; but this tract is chiefly remarkable for producing metals of inferior worth. "Nothing," says Mr. Pennant, "can equal the gloomy appearance of the country round. Neither tree, nor shrub, nor verdure, nor picturesque rock, appears to amuse the eye. The spectator must plunge into the bowels of these mountains for entertainment." The veins of lead lie mostly N. and E. and their thickness, which seldom exceeds 40 feet, varies greatly in different parts. The scanty pasture here feeds some sheep and cattle; but those in the neighbourhood of the mines, sometimes perish by drinking the water in which the lead ore has been washed; for this ore communicates a deleterious quality to the water, though that liquid acquires no noxious taint from remaining in leaden pipes and cisterns, unless the water contain acid.

COADUNATÆ (*Encycl.*). Erroneously spelt **COADUNATE**.

COALS (*Encycl.*). To what has been said under that article, we wish to add the following observations and experiments on the formation and properties of pit-coal, by Mr. Eglesfield Smith.

"Pit-coal," says he, "is a black, compact, brittle, and infusible substance; of a moderate hardness, and laminated structure, more or less shining, but incapable of taking any great degree of polish. It is generally found below the surface of the earth, where it lies in nearly horizontal strata, sometimes many yards thick. When distilled it yielded the following products:

"One hundred ounces of pit-coal, distilled in a strong heat, gave fourteen ounces and a half of liquid, and fifty-nine ounces of cinder; the rest was evolved in the form of an air, which, caught in bladders and glasses, upon examination seemed to be in part composed of true hydrogen, as it inflamed and went off with a degree of explosion when mixed with the atmospheric air; whether azotic or other gas was evolved at the same time I could not determine.

"The liquid obtained from the coal by distillation had its surface covered with an empyreumatic oil, which seemed more or less fluid according to the degree of heat used in the distillation.

"In the middle of the receiver was a reddish fluid of an

acid taste, and which seemed loaded with oil. At the bottom was found a thick tenacious substance like tar.

"I shall now endeavour to prove that pit-coal is a vegetable substance oxygenated to a certain degree. But how the immense mountains of this substance which are found in the bowels of the earth are formed cannot easily be conceived: they cannot be produced by the decay of a few forests upon its surface, which they say have been buried by earthquakes or other changes which have taken place in it; a cause more proportionate to the magnitude of the effect is required.

"From the prints of shells and fishes which are found in the different strata of coal, its formation has been evidently submarine, and it is to the sea that we are to look for the immense produce of vegetable matter which is required for its formation. This, together with what is brought into it by rivers, being broken by the waves and currents, and heaped together, is covered with sand, and becomes decomposed.

"Wood, when it has been buried under the surface of the earth for a length of time, acquires the hardness and brittleness of pit-coal in a great degree; and we often find pieces of coal which have the annular lines of the wood strongly marked upon them. A piece of oak, when dried and distilled, produced the following results, which will be found to be nearly the same with those obtained from the pit-coal, though differing in their qualities.

"An hundred ounces of the heart of the oak, when dried, produced on distillation thirty-nine ounces of liquid, and thirty-four of charcoal, the rest being dissipated in the form of inflammable air.

"On the surface of the liquid floated an oil nearly the same as that obtained from the pit-coal. The liquid had an acid taste, and turned slips of paper, tinged blue by the purple acid, to a red colour. At the bottom of the receiver was found a tenacious substance, the same as was produced from the pit-coal, only differing in being more fluid. Other woods yielded the same substances, but the harder the wood it yielded more of the oil; and that oil was more or less thick according to the degree of heat used in the distillation.

"The following experiments will shew further how nearly pit-coal and wood are allied to each other.

"I took half an ounce of pit-coal, and having reduced it to a fine powder, poured upon it two ounces of the oil of turpentine: by applying to it a heat a little above that of boiling water, I dissolved the whole into a mass or fluid like that of tar, but more transparent.

"I then took an ounce of charcoal, and treated it in the same manner, but I found it would not dissolve, but remained swimming in small particles in the fluid. I added to the fluid forty drops of sulphuric acid, and still no solution took place. I then poured into it a quarter of an ounce of strong nitrous acid, and a violent inflammation ensued. This mixture I afterwards kept in a sand-bath of moderate heat for near half an hour, and upon examination I found the residue quite dissolved, and resembled that procured from the pit-coal so much, that it was impossible to distinguish the one from the other. I treated some pounded pit-coal in the same manner as I had done the charcoal, saving the circumstance of putting it into the sand-bath, and the only difference in the result was, that it resembled pitch more than the former, being of a thicker consistence.

"I then inflamed some oil of turpentine by means of the nitrous acid, and I found that the residue was a kind of tar, resembling the residue obtained from the foregoing experiments. I shall endeavour to explain how these solutions took place.

"The first experiment was to try whether or not pit-coal was a bitumen, or a resinous substance, which is proved by its being completely soluble in the oil of turpentine. The second

M. Chabannes' Machine for Separating Coals.

experiment shews, that charcoal is an oxygenated wood, but not sufficiently oxygenated to become soluble in the oil of turpentine, till by the addition of the nitrous acid it becomes completely soluble like bitumen and charcoal, and thereby shews that it nearly resembles those substances.

"The *third* experiment shews, that the nitrous acid does not alter pit-coal, otherwise than by thickening it.

"The *fourth* experiment shews, that oil of turpentine, when oxygenated to a high degree, becomes a sort of bitumen, or rather petroleum.

"From the above we see how nearly wood and pit-coal are allied to each other; and that wood, when treated chemically, will yield the same products as pit-coal.

"I shall now shew how this process takes place in the bowels of the earth. The quantities of vegetable matter which have been collected together, either by the violence of floods or other convulsions of nature, becoming in time covered with a vegetable sward, which continues to increase until it entirely excludes the air, while lying in this state undergoes a degree of fermentation, during which the vegetable matter attracts the oxygenating principle from the water, and becomes thereby highly oxygenated. The slowness of this process gives the wood a greater degree of attraction for the oxygen, which is, perhaps, assisted by the exclusion of the air. The inflammable principle of the water, or the hydrogen, is evolved, and forms that air which is so troublesome to miners.

"Iron and sulphur are formed during this decomposition of vegetable matter, which accounts for the formation of pyrites, which are so often found in coal-mines.

"From the large quantities of inflammable air which are let loose in the decomposition of vegetable substances, we may, in some measure, account for the continual showers which woody and marshy countries are subject to, and why dry and sandy countries are generally without them. Hence we may likewise account for thunder being so common in hot woody countries. In these countries, vegetables soon putrify and decay; and the large quantities of inflammable air which must be necessarily evolved during their decay, mixing with the oxygen of the air, and fired by electricity, explode and fall down in rain, and again serve for the growth and nourishment of plants. In this process of vegetation the inflammable principle of the water is absorbed by the plant, while the oxygen is evolved, and serves, by purifying the exhausted atmosphere, to support animal life."

The combustion of this valuable fuel has been promoted, and its use economized, by a variety of excellent inventions. The following is the specification of a patent granted to Mr. Chabannes, of Welbeck-street, London, for a machine for separating coals, and a composition for making small-coal into cakes or bricks to be used for fuel.

"Coals, consisting of great and small mixed together, such as are usually bought in the pool in the river Thames for consumption in the cities of London and Westminster, and their environs, are to be discharged or thrown upon grates or gratings of the description herein-after contained, which grates or gratings are to be fixed either horizontally or on an inclined plane; and, by means of such discharge, and throwing of the said coals, the small coals will be separated from the large. The grates or gratings are to be constructed either of wood or metal, and are to be of any length or breadth suited to the place where they are fixed, and to have bars at a distance from each other not less than a quarter of an inch, nor more than an inch and an half. The form of these grates or gratings is particularly described in Plate 22. The composition is to consist of the small coals so separated as above mentioned from the large coals, and a small quantity of earth, clay, cow-dung, tar, pitch, broken glass, sulphur, saw-dust, oil-cakes, tan, or wood, or of

any other combustible ingredient, to be mixed together and ground with a wheel in water in a wooden vessel. The composition, together with the water, is then to be conveyed by pipes, or any other conductor, into pits or holes of any dimensions, made for that purpose, to be lined with tiles or bricks cemented together with water, except in the centre, where a drain or watercourse is to be cut below the pit or hole, and such drain or watercourse is to be covered over with uncemented tiles, by which means the water will pass off into the drain or watercourse, and leave the composition in the pit or hole. The composition is then to be moulded into brick-cakes or balls, and put on a frame to dry; and when dry is fit for use as fuel."

Reference to the plate.—A. Plan of the grate or grating. B. Vessel in which the coals are raised from the barge, and from whence they are thrown on the grate or grating to separate them. C. The profile of the grate or grating with the coals running on it. D. is the stage where the small coal is received.

COALLIER, a vessel employed to carry coals from one port to another; chiefly from the northern parts of England to the capital, and more southerly parts, as well as to foreign markets. This trade is known to be an excellent nursery for seamen; although they are often found, from the constitution of their climate, not to be so well calculated for southern navigation.

COB, a kind of mud-wall. In those parts of England where stone is scarce, it is usual to make walls and houses of mud, or, as it is called in Devonshire, *cob*; which is a composition of earth and straw, wetted up somewhat like mortar, but well beat and trod together. When a wall is making, after being raised to a certain height, it is allowed time to pitch or settle before the work is resumed. Some value themselves on their skill in building with this composition; the price, when materials are found, is generally in Devonshire 3s. per perch of 16½ feet; but a stone foundation costs more. Houses built with this, being covered with thatch, are very dry and warm: a cob-wall, if in a good situation, will last 50 or 60 years or more. When pulled down, they are used as manure, and new earth employed to rebuild with.

COBHAM, a village in Surrey, remarkable for Paine's Hill, the seat and beautiful gardens of the late Mr. Hopkins. Cobham is 19 miles S.W. by W. of London.

COCA, a town of Old Castile, in Spain, seated among mountains; and near it is a strong castle for state prisoners.

COCHIEIM, a town in the electorate of Treves, formerly imperial; seated on the Moselle, 25 miles S.W. of Coblenz. Long. 7. 2. E. Lat. 50. 12. N.

COCHIN-CHINA (*Encyc.*). Little of the history of this kingdom is known: what follows depends entirely on the credit of M. le Poivre, a French traveller.—About half a century before the French first arrived in these distant regions, a prince of Tonquin, as he fled from his sovereign, by whom he was pursued as a rebel, had, with his soldiers and adherents, crossed the river, which serves as a barrier between Tonquin and Cochin-China. The fugitives, who were warlike and civilized men, soon expelled the scattered inhabitants, who wandered about without any society or form of government, and founded a new kingdom, which soon grew rich and populous. During the reign of the first six kings, no nation could be happier than the Cochin-Chinese. Their monarchs governed them as a father does his family, establishing no laws but those of nature, to which they themselves were the first to pay obedience. They honoured and encouraged agriculture, as the most useful employment of mankind; and required from their subjects only a small annual free-gift to defray the expense of their defensive war against the Ton-

quines, who were their enemies. This imposition was regulated by way of poll-tax, with the greatest equity. Every man, able to till the ground, paid to the prince a small sum proportioned to the strength of his constitution, and the vigour of his arm : and nothing more.

Cochin-China continued happy under these princes for more than a century ; but the discovery of gold-mines put a stop to these mild regulations. Luxury immediately took place. The prince began to despise the simple habitation of his ancestors, and caused a superb palace to be built, a league in circumference, surrounded with a wall of brick on the model of that of Pekin, and defended by 1600 pieces of cannon. Not content with this, he would needs have a winter palace, an autumn palace, and a summer palace. The old taxes were by no means sufficient to defray these expences ; new ones were devised ; and oppression and tyranny every-where took place. His courtiers, to flatter their prince, gave him the title of the *king of heaven*, which he still continues to assume. When speaking of his subjects, he styles them his *children*, but by no means behaves as if he was their father : for our author informs us, that he has seen whole villages newly abandoned by their inhabitants, who were harassed with toil and insupportable exactions ; the necessary consequence of which was, that their lands returned to their former uncultivated state.

M. le Poivre represents the Cochinchinese as gentle, hospitable, frugal, and industrious. There is not a beggar in the country ; and robbery and murder are absolutely unknown. A stranger may wander over the kingdom from one end to the other (the capital excepted), without meeting with the slightest insult. He will be every-where received with the most eager curiosity, but at the same time with the greatest benevolence. A Cochinchinese traveller, who has not money sufficient to defray his expences at an inn, enters the first house of the town or village he arrives at, and waiting the hour of dinner, takes part with the family, and goes away when he thinks proper, without speaking a word, or any person's putting to him a single question.

The country of Cochin-China is much of the same temperature with that of Tonquin ; though rather milder, as lying nearer the sea. Like Tonquin, it is annually overflowed, and consequently fruitful in rice, which requires no other manure than the mud left by the inundations. They have sugar-canes, and the same kinds of fruits common to other parts of India. The country produces no grapes, and therefore they drink a liquor brewed from rice. They have vast woods of mulberry-trees, which run up as fast as our hemp. Their silk is stronger than that of China, but not so fine. They have the best timber in the world, particularly a sort which abounds in the mountains, and is called the *incorruptible tree* ; because it never rots under earth or water, and is so solid that it serves for anchors. There are two kinds, black and red. The trees are very tall, straight, and so big that two men can scarce fathom them. They have also, on the mountains of the Kemois, a tree of the most fragrant scent, which is supposed to be the same with lignum aloes. This, being reckoned the best product of the country, is engrossed by the king, and is sold from five to 16 ducats per pound. It is highly valued both in China and Japan, where the logs of it are sold for 200 ducats a-pound, to make pillows for the king and nobility ; and among those Indians which continue to burn their dead, great quantities of it are used in the funeral piles. The young trees, called *aquila*, or eagle-wood, are every one's property, which makes the old ones, called *calamba*, so scarce and dear. They have oak, and large pines, for the building of ships ; so that this country is of the same use to China, that Norway is to Britain. In general, they have the same kind of trees and plants that are to be met with in Tonquin.

They have mines of gold, as well as diamonds ; but the last they do not value so highly as pearl. They also esteem their coral and amber very much. In all the provinces there are great granaries filled with rice, in some of which that grain is kept upwards of 30 years. One of the greatest rarities in these parts, especially in grand entertainments, is a ragout made of the eatable birds-nests, which some say are found only in Cochin-China, and others in four islands that lie south of its coast. See BIRDS-NESTS.

The merchants of Cambodia, Tonquin, China, Macao, Manila, Japan, and Malacca, trade to Cochin-China with plate, which they exchange for the commodities of the country. The Portuguese are the most favoured here of any Europeans. The Cochinchinese themselves, not being inclined to travel, seldom fall out of sight of their own shore, but purchase many trifles from foreigners at great rates, particularly combs, needles, bracelets, glass pendants, &c. They are very fond of our hats, caps, girdles, shirts, and other clothes ; and, above all, set a value on coral. The country is said to have 700 miles of coast, with many large inlets of the sea, and above 60 convenient landing places ; which, however, according to Captain Hamilton, are but seldom visited by strangers.

COCCINELLA (*Encyel.*). Under that head we have given the natural history of that valuable insect called COCHINEAL ; but having referred to it in our treatise on DYEING, it is highly necessary to speak of its qualities in that respect. The following account is drawn from the celebrated Berthollet.

Two sorts of cochineal are gathered at Mexico ; the *sylvestris*, there known by the Spanish name of *grana sylvestra*, and the fine, or *grana fina*, called also *Mesquite*, from the name of a province of Mexico, and which are bred upon the nopal. The first is smaller, and covered with a cottony down, which increases its weight, with a substance which is useless in dyeing ; an equal weight of it therefore gives less colour, and is of a lower price than the fine cochineal ; but these disadvantages are perhaps compensated by its being reared with greater facility, and at less expence, and even by the effects of its down, which enables it the better to resist rain and storms.

The cochineal *sylvestris*, when bred upon the nopal, loses part of its tenacity, and some of its cotton, and acquires double the size it has on the other species of opuntia. It is therefore probable that it would be improved by a continued attention to the rearing of it, and would approach more and more to the fine cochineal.

M. Thieri de Menonville was led by his patriotic spirit and personal courage, to expose himself to imminent danger, in going to observe the mode of rearing the cochineal in Mexico, in order to obtain from thence that valuable production, where-with he might enrich the colony of St. Domingo. He brought back with him both species of cochineal, and nopals, the kind of opuntia which affords the best food for insects.

Upon his return, he employed himself in the cultivation of the nopal and different kinds of opuntia, and in rearing the two species of cochineal ; but death cut off that excellent citizen, and the fine cochineal soon perished.

When he returned to St. Domingo, he discovered the cochineal *sylvestris* upon a kind of opuntia called *pereskia*, or *patte de tortue*, which grows there. This discovery did not remain unprofitable : M. Bruley employed himself successfully in rearing this species of cochineal ; he communicated it to the Cercle des Philadelphes (now the Royal Society of Arts and Sciences at Cape François), who do not lose sight of that object, and have published a posthumous work of M. Thieri de Menonville, which contains very minute instructions

with regard to every thing that respects the cultivation of the nopal, and the other species of opuntia that may be substituted for it more or less successfully, for breeding or rearing the cochineal.

Two months after the females which have been reserved are found upon the nopal, the young cochineals are observed to issue from them; and then is the proper season for gathering them: they are killed by immersion in boiling water. The hot iron plates or ovens which are sometimes employed may injure the cochineal by being too hot. When taken out of the water, they are carefully dried by free exposure to the sun. They lose nearly two-thirds of their weight in drying.

When the fine cochineal is dry, it must be passed through a sieve sufficiently coarse to allow it to go through, but capable of retaining the down and cotton of the larvæ of the males. These are kept apart and sold separately, or with the coccinella sylvestris.

Fine cochineal, which has been well dried and properly kept, ought to be of a gray colour inclining to purple. The gray is owing to a powder which covers it naturally, a part of which it still retains: the purple tinge proceeds from the colour extracted by the water in which it has been killed.

Cochineal will keep a long time in a dry place. Hellot says, that he tried some, one hundred and thirty years old, and found it produced the same effect as new.

It has been pretty generally supposed, that cochineal owes its colour to the nopal on which it lives, the fruit of which is red. But M. Thieri de Menonville observes, that the juice which supplies it with nutriment is greenish; and that it can live and propagate its species on such kinds of opuntia as do not bear red fruit.

The decoction of cochineal is of a crimson colour, inclining to violet. A small quantity of sulphuric acid made this liquor assume a red colour, inclining to yellow, and a small quantity of a beautiful red precipitate was formed. Muriatic acid produced nearly the same change in the colour, but no precipitate. Solution of tartar changed the liquor to a yellowish red. A little precipitate of a pale red colour formed slowly: the supernatant liquor remained yellow, but on pouring in a little alkali, it became purple. The small quantity of precipitate was quickly dissolved by the alkali, and the solution was purple. Solution of tin formed a rose-coloured precipitate with the yellow liquor.

Solution of alum brightened the colour of the infusion, and gave it a redder hue: a crimson precipitate was formed, and the supernatant liquor retained a crimson colour, somewhat reddish. Alum and tartar mixed, produced a brighter colour, more lively, and inclining to a yellowish red. A precipitate was formed, but much less abundant, and much more pale, than in the preceding experiment. Solution of tin produced a copious sediment of a beautiful red. The liquor remaining above it was as clear as water, and suffered no change of colour on adding alkali.

Having poured in a solution of tartar, and after that, solution of tin, a precipitate of a rose colour inclining to black was formed more quickly than in the foregoing experiment; and, though solution of tin in excess was added, the supernatant liquor remained a little yellow.

Solution of muriat of soda rendered the colour somewhat deeper, but did not make the liquor turbid. Ammoniacal muriat gave a purple tinge, without occasioning any precipitate. Sulphat of soda produced no perceptible change in the liquor.

Having boiled a little cochineal with half its weight of tartar, the liquor was more inclining to red, and had a colour much less deep than that obtained from an equal quantity of cochineal without tartar: but the former gave a more abundant precipitate with solution of tin, and its colour was more

rosy: so that tartar favours the solution of the colouring part of the cochineal: for, though the colour of the solution is less deep, the precipitate produced from it by solution of tin, is of a deeper and more rosy hue. This experiment deserves notice, in judging of the influence of tartar in dyeing scarlet.

Sulphat of iron formed a brown violet precipitate. The supernatant liquor remained clear, with a tinge of feuillemort. Sulphat of zinc formed a deep violet precipitate. The supernatant liquor remained clear and colourless. Acetate of lead produced a purple violet precipitate, less deep than the preceding. The supernatant liquor remained limpid. Sulphat of copper produced a violet sediment, which formed slowly. The liquor remained clear, and of a violet colour.

If the extract which decoction of cochineal affords on evaporation be digested in alcohol, the colouring part dissolves, and leaves a residuum of the colour of wine-ices, of which fresh alcohol cannot deprive it. This residuum, analyzed by fire, affords the common products of animal substances.

The alcohol of cochineal, leaves, on evaporation, a transparent residuum of a deep red, which, when dry, has the appearance of a resin. This also, if distilled, yields the products of animal substances; which shews, that the colouring matter is an animal production.

Yet the decoction of cochineal does not easily putrefy, as some was kept more than two months, both in an open vessel and in a bottle corked. At the end of that time, the former shewed no signs of putrefaction: the latter had a slight putrid smell. The first grew turbid in a few days, and left a brown violet sediment on the filter: the second preserved its transparency a long time, and probably lost it only from the effect of an incipient putrefaction, or rather of a slight combustion, produced by means of a little oxygen, probably united with the red particles of the cochineal. The colour of each had become crimson: but that of the former was more weak, because a greater part of the colouring matter had precipitated, in consequence of the effects produced on it by the air, agreeably to the principles established before.

M. Berthollet compared the coccinella sylvestris of Mexico, and some which had been cultivated at St. Domingo, and sent over by Mr. Bruley, with the masticque cochineal. The decoction of the sylvestris has the same hue as that of St. Domingo. This inclines more to crimson than that of masticque: but the precipitates obtained from it, either by solution of tin or by alum, are perfectly equal in colour to those from the masticque cochineal; and to these precipitates the stuffs with which they combine owe their colour.

To determine the proportion of colouring matter detained in decoctions of different cochineals, M. Berthollet employed oxygenated muriatic acid. Of each of the three cochineals above mentioned, he boiled an equal weight for an hour, rendering the circumstances with regard to each as nearly similar as possible. Having filtered the decoctions, he poured them into separate graduated glass cylinders, and added to them oxygenated muriatic acid, from the same bottle, till they were all reduced to the same yellow hue. The quantities of acid which indicated the proportions of the colouring matter were found to be nearly as follows: for the cochineal of St. Domingo, eight; for the sylvestris, eleven; for the masticque, eighteen.

It appears, then, that the cochineal of St. Domingo is not only greatly inferior to the masticque, but even to the sylvestris of Mexico; and in fact it is much smaller and more downy; but these disadvantages ought not to abate the zeal of those who are engaged in its cultivation.

The observations of M. Thieri de Menonville have already proved, that the coccinella sylvestris loses its down, and in-

creases in size, by a succession of breeds carefully attended to, though at first he was obliged to use nopalæ not come to the proper growth. There is every reason to hope, therefore, that the St. Domingo cochineal may, by assiduous care, be brought to equal, or perhaps surpass, the sylvestris of Mexico; but should it always remain inferior with respect to the quantity of its colouring matter, this would be by no means a sufficient reason to neglect a substance so valuable in dyeing.

It has been seen, that the cochineal of St. Domingo is not inferior to the malleque, as to the quality of its colour. If then the down with which it is covered prove detrimental, in operations on a large scale, to the beauty of scarlet, the lustre of which is so easily injured, it might be advantageously employed either for scarlet in half grain or for crimson, and other shades which are less delicate than that, which is the brightest of all colours.

To form an idea of the utility of which cochineal may be to St. Domingo, possessed of so many rich productions, is difficult. M. Thieri de Monville considers it as a valuable resource for those parts of the island, the unfruitful soil of which is not adapted to the other produce; and for those colonists who are unable to support the expence attending the cultivation of other crops. Mr. Bruley speaks still more favourably of the advantages to be expected from the culture of cochineal: but the Cercle des Philadelphes is more reserved, and thinks, that the point is not yet to be decided upon.

The attempts that have been made deserve so much the more to be pursued and encouraged, as they have for their object an important branch of commerce, and as enlightened industry has great advantages over ignorant indolence, it will be found less difficult perhaps to naturalize cochineal, at least in hot countries, than it was to naturalize silk-worms.

A distinguishing characteristic between cochineal and madder, may be observed in the manner in which they are acted on by reagents. Both receive a yellow colour from acids: but if the colouring matter of cochineal be separated by a substance which precipitates it from the acid liquor, it reappears, with its natural colour little altered; whilst that of madder, treated in the same manner, retains a yellow or fawn tinge. Hence mordants abounding in acid, as solution of tin, are much more successfully employed with cochineal than with madder. The cause of this probably is, that the colouring matter of madder united with oxyd of tin retains a portion of acid, whilst that of cochineal combined with it retains none, or a much smaller quantity.

COCKER, a river which rises in the S. of Cumberland, and flowing through the lakes of Buttermere, Cromack-water, and Lowes-water, joins the Derwent, below Cockermouth.

CODOGNO, a town of Italy, in the duchy of Milan, near the confluence of the Adda and Po, 33 miles E. of Pavia. Long. 10. 49. E. Lat. 45. 6. N.

COGGESHAL, a town in Essex, with a market on Saturday. It is seated on the river Blackwater, and has a manufactory of bays. It is 43 miles E.N.E. of London. Long. 0. 47. E. Lat. 51. 52. N.

COGNATE, in Scots law, any male relation through the mother.

COGNITIONIS CAUSA, in Scots law. When a creditor charges the heir of his debtor to enter, in order to constitute the debt against him, and the heir renounces the succession, the creditor can obtain no decret of constitution of that debt against the heir; but only a decret subjecting the *hereditas jacens*, or the estate which belonged to the debtor, to his diligence: and this is called a decret *cognitionis causa*.

COHESION (*Encycl.*). This power was first considered by Sir Isaac Newton as one of the properties essential to all matter, and the cause of all that variety we observe in the texture of different terrestrial bodies. He did not, however, ab-

solutely determine that the power of cohesion was an immaterial one; but thought it might possibly arise, as well as that of gravitation, from the action of an ether. His account of the original constitution of matter is as follows: "It seems probable, that God in the beginning formed matter in solid, massy, impenetrable, moveable particles; of such sizes, figures, and other properties, and in such proportion to space, as might be conduced to the end for which he formed them: and that these primitive particles being solid, are incomparably harder than any porous bodies composed of them; even so very hard as never to wear or break in pieces; no ordinary power being able to divide what God himself made one at the first creation. While the particles continue entire, they may compose bodies of one and the same nature and texture in all ages; but should they wear away, or break in pieces, the nature of all things depending on them would be changed. Water and earth composed of old worn particles and fragments of particles, would not now be of the same texture with water and earth composed of entire particles in the beginning. And therefore, that nature may be lasting, the changes of corporeal things are to be placed in the various separations and new associations and motions of these permanent particles; compound bodies being apt to break, not in the midst of solid particles, but where these particles are laid together and touch in a few points." It seems further, "That these particles have not only a *vis inertiae*, accompanied with such passive laws of motion as naturally result from that force; but also that they are moved by certain active principles, such as that of gravity, and that which causeth fermentation and the cohesion of bodies. These principles are to be considered not as occult qualities, supposed to result from the specific forms of things, but as general laws of nature by which the things themselves are formed; their truth appearing to us by phenomena, though their cause is not yet discovered."

The general law of nature, by which all the different bodies in the universe are composed, according to Sir Isaac Newton, is that of attraction: i. e. "Every particle of matter has an attractive force, or a tendency to every other particle; which power is strongest in the point of contact, and suddenly decreases, inasmuch that it acts no more at the least sensible distance, and at a greater distance is converted into a repellent force, whereby the parts fly from each other. On this principle of attraction may we account for the cohesion of bodies, otherwise inexplicable.

"The smallest particles may cohere by the strongest attractions, and compose bigger particles of weaker virtue; and many of these may cohere, and compose bigger particles, whose virtue is still less; and so on for divers successions, until the progression end in the biggest particles, on which the operations in chemistry, and the colours of natural bodies, depend; and which, by cohering, compose bodies of a sensible magnitude. If the body is compact, and bends or yields inward to pressure without any sliding of its parts, it is hard and elastic; returning to its figure with a force arising from the mutual attraction of its parts. If the parts slide from one another, the body is malleable or soft. If they slip easily, and are of a fit size to be agitated by heat, and the heat is great enough to keep them in agitation, the body is fluid; and if it be apt to stick to things, it is humid; and the drops of every fluid affect a round figure by the mutual attractions of their parts, as the globe of the earth and sea affects a round figure from the mutual attraction and gravity of its parts.

"Since metals dissolved in acids attract but a small quantity of the acid, their attractive force reaches but to a small distance. Now, as in algebra, where affirmative quantities cease, there negative ones begin; so in mechanics, where attraction ceases, there a repulsive virtue must succeed. That there really is such a virtue seems to follow from the reflex-

tions and inflections of the rays of light; the rays being repelled by bodies in both these cases without the immediate contact of the reflecting or inflecting body. The same thing seems also to follow from the emission of light; a ray, as soon as shaken from off a body by the vibrating motion of the parts of the body, and got beyond the reach of attraction, being driven away with exceeding great velocity: for that force which is sufficient to turn it back in reflection may be sufficient to emit it. From the same repelling power it seems to be that flies walk upon the water without wetting their feet; that the object-glasses of long telescopes lie upon one another without touching; and that dry powders are difficultly made to touch one another so as to stick together, without melting them or wetting them with water, which, by exhaling, may bring them together.

"The particles of all hard homogeneous bodies which touch one another, cohere with a great force: to account for which, some philosophers have recourse to a kind of hooked atoms, which in effect is nothing else but to beg the question. Others imagine, that the particles of bodies are connected by the rest, *i. e.* in effect by nothing at all; and others, by conspiring motions, *i. e.* by a relative rest among themselves. For myself, it rather appears to me, that the particles of bodies cohere by an attractive force, whereby they tend mutually to each other."

From this account of the formation and constitution of bodies, we can conclude nothing, except that they are composed of an infinite number of little particles, kept together by a force or power; but of what nature that power is, whether material or immaterial, we must remain ignorant till further experiments are made. Some of the Newtonian philosophers, however, have positively determined these powers to be immaterial. In consequence of this supposition, they have refined upon attractions and repulsions, that their systems seem not far from downright scepticism, or denying the existence of matter altogether. A system of this kind we find adopted by Dr. Priestley, from Messrs. Boscovich and Michell, in order to solve some difficulties concerning the Newtonian doctrine of fire. "The easiest method (says he) of solving all difficulties, is to adopt the hypothesis of Mr. Boscovich, who supposes that matter is not impenetrable, as has been perhaps universally taken for granted; but that it consists of physical points only, endued with powers of attraction and repulsion in the same manner as solid matter is generally supposed to be: provided therefore that any body move with a sufficient degree, of velocity, or have a sufficient momentum to overcome any powers of repulsion that it may meet with, it will find no difficulty in making its way through any body whatever; for nothing else will penetrate one another but powers, such as we know do in fact exist in the same place, and counterbalance or over-rule one another. The most obvious difficulty, and indeed almost the only one that attends this hypothesis, as it supposes the mutual penetrability of matter, arises from the idea of the nature of matter, and the difficulty we meet with in attempting to force two bodies into the same place. But it is demonstrable that the first obstruction arises from no actual contact of matter, but from mere powers of repulsion. This difficulty we can overcome; and having got within one sphere of repulsion, we fancy that we are now impeded by the solid matter itself. But the very same is the opinion of the generality of mankind with respect to the first obstruction. Why, therefore, may not the next be only another sphere of repulsion, which may only require a greater force than we can apply to overcome it, without disordering the arrangement of the constituent particles; but which may be overcome by a body moving with the amazing velocity of light.

"This scheme of the immateriality of matter, as it may be

called, or rather the mutual penetration of matter, first occurred to Mr. Michell on reading *Baxter on the immateriality of the soul*. He found that this author's idea of matter was, that it consisted as it were of bricks cemented together with immaterial mortar. These bricks, if he would be consistent with his own reasoning, were again composed of less bricks, cemented likewise by an immaterial mortar; and so on *ad infinitum*. This putting Mr. Michell upon the consideration of the several appearances of nature, he began to perceive that the bricks were so covered with this immaterial mortar, that if they had any existence at all, it could not possibly be perceived: every effect being produced, in nine instances of ten certainly, and probably in the tenth also, by this immaterial, spiritual, and penetrable mortar. Instead therefore of placing the world upon the giant, the giant upon the tortoise, and the tortoise upon he could not tell what, he placed the world upon itself."

Other philosophers have supposed the powers both of gravitation and cohesion to be material; and to be only different actions of the ethereal fluid, or elementary fire. In support of this it hath been urged, that before we have recourse to a spiritual and immaterial power as the cause of any natural phenomenon, we ought to be well assured that there is no material substance with which we are acquainted, that is capable of producing such effects. In the present case, we are so far from having such assurance, that the contrary is manifest to our senses. One instance of this is in the experiment with the *Mageburg hemispheres*, as they are called. These are two hollow hemispheres of brass, exactly fitted to one another, so as to form one globe when joined together, without admitting any air at the joining. In this state, if the air within them is exhausted by means of a pump, they will cohere with such force, if they are five or six inches diameter, as to require a weight of some hundreds of pounds to separate them. The pressure of the atmosphere, we see, is in this case capable of producing a very strong cohesion: and if there is in nature any fluid more penetrating, as well as more powerful in its effects, than the air we breathe, it is possible that what is called the attraction of cohesion may somehow or other be an effect of the action of that fluid. Such a fluid as this is the element of fire. Its activity is such as to penetrate all bodies whatever: and in the state in which it is commonly called fire, it acts according to the quantity of solid matter contained in the body. In this state, it is capable of dissolving the strongest cohesions observed in nature: but whatever is capable of dissolving any cohesion, must necessarily be endued with greater power than that by which the cohesion is caused. Fire, therefore, being able to dissolve cohesions, must also be capable of causing them; provided its power is exerted for that purpose. Nor will it seem at all strange that this fluid should act in two such opposite ways, when we consider the different appearances which it assumes. These are three, *viz.* fire, or heat, in which it consumes, destroys, and dissolves: light, in which it seems deprived of all destructive or dissolvent power, and to be the most mild, quiet, and placid being in nature. The third state of this element is, when it becomes what is called the *electric fluid*; and then it attracts, repels, and moves bodies, in a vast variety of ways, without either burning or rendering them visible by its light. In this state it is not less powerful than in either of the other two; for a violent shock of electricity will displace and tear in pieces the most heavy and solid bodies. The seeming capricious nature of this fluid, however, probably renders it less suspected as the cause of cohesion, than it otherwise would be, were the attractions regular and permanent, which we observe it to occasion. But here we must observe, that the fluid has an existence in all bodies before the experiments are tried.

which make its effects visible to us, and was acting in them according to its settled and established laws. While acting in this manner it was perfectly invisible; and all we can do is, to produce some little infringement of these regular laws according to which it commonly acts. In some cases, however, the electrical attractions produced by art are found to be pretty permanent and strong. Thus, Mr. Symmer, in some experiments with silk stockings, found their attraction so strong, that it required upwards of 15 pounds weight to separate them from each other; and this attraction would continue for more than an hour. In plates of glass, too, he observed a remarkable cohesion when electrified. In the *Philosophical Transactions* for 1777, we find this hypothesis taken notice of, and in some measure adopted, by Mr. Henry. "Some gentlemen (says he) have supposed that the electric matter is the cause of the cohesion of the particles of bodies. If the electric matter be, as I suspect, a real elementary fire inherent in all bodies, that opinion may probably be well founded: and perhaps the folding of metals, and the cementation of iron, by fire, may be considered as strong proofs of the truth of their hypothesis."

On this last hypothesis we must observe, that if the electric or any other fluid is supposed to be the cause of the attraction of cohesion universally, the particles of that fluid must be destitute of all cohesion between themselves; otherwise we should be at as great a loss to account for the cohesion of these particles, as for that of terrestrial matter. Philosophers, indeed, do not suppose any cohesion between the particles of the electric fluid themselves; it is generally believed that the particles of this fluid are repulsive of one another, though attracted by all other matter. If this is a fact, we cannot suppose the electric fluid to be the cause of cohesion. The probability or improbability of the hypothesis just mentioned must greatly depend on its being ascertained whether the particles of the electric fluid do really repel one another, and attract all other kinds of matter, or not; but for this we must refer to the article *ELECTRICITY*.

COIMBETTORE, a province and town of the peninsula of Hindoostan, in the kingdom of Mysore. It was taken by General Meadows, January 22, 1790, but retaken by a detachment of Tippoo Sultan's army, in October 1791; and confirmed to him by the peace of 1792. It is 100 miles S. by E. of Seringapatam. Long. 77. 10. E. Lat. 10. 5. N.

COIN (*Encycl.*), differs from money as the species from the genus. Money is any matter, whether metal, wood, leather, glass, horn, paper, fruits, shells, or kernels, which have currency as a medium in commerce. Coin is a particular species, always made of metal, and struck according to a certain process called coining.

The precise epocha of the invention of money is too ancient for our annals; and, if we might argue from the necessity and obviousness of the thing, must be nearly coeval with the world.

Whether coins be of equal antiquity, may admit of some doubt; especially as most of the ancient writers are so frequent and express in their mention of leathern-moneys, paper-moneys, wooden-moneys, &c. Some, however, notwithstanding this, are of opinion, that the first moneys were of metal: the reasons they give, are the firmness, neatness, cleanliness, durability, and universality of metals; which, however, do rather conclude they ought to have been so, than that they actually were so.

In effect, the very commodities themselves were the first moneys, *i. e.* were current for one another by way of exchange; and it was the difficulty of cutting or dividing certain commodities, and the impossibility of doing it without great loss, that first put men on the expedient of a general medium. See *EXCHANGE*.

COLDING, a town of Denmark, in North Jutland, remarkable for its bridge, over which all the oxen and cattle pass, that go from Jutland into Holstein, and they pay a small toll. Here is a royal palace, containing a magnificent suite of 190 rooms, which have not been furnished since the time of Frederic III. The harbour is two miles in circumference, and deep enough for ships of the largest burthen. Colding, which is situated at the extremity of a bay of the Little Belt, is fifty miles S. by E. of Wiborg. Long. 10. 15. E. Lat. 55. 35. N.

COLDINGHAM, a barren heathy moor on the borders of Scotland. It is only remarkable for a convent formerly filled with most heroic nuns; who, to preserve themselves inviolate from the Danes, cut off their lips and noses; and thus rendering themselves objects of horror, were, with their Abbess Ebba, in 870, burnt in the monastery by the disappointed savages.

COLDSTREAM, a small market-town, on the Tweed (over which is a handsome bridge), in the county of Berwick, in Scotland. It had a famous monastery; and here General Monk raised the two battalions, now known by the name of the Coldstream Regiment of Guards. Long. 2. 5. W. Lat. 55. 36. N.

COLEBROOK DALE, on the banks of the Severn, in Shropshire, is a winding glen, between two vast hills, which break into various forms, being all thickly covered, and forming beautiful sheets of hanging woods. Here are the most considerable iron works in England. "The noise of the forges, mills, &c." says Mr. Young, "with all their vast machinery, the flames bursting from the furnaces, with the burning of coal, and the smoke of the limekilns, are altogether horribly sublime." Two bridges entirely made of cast-iron, which have been thrown over the Severn, give these scenes a still nearer resemblance to the ideas in romance. There is also, in the dale, a remarkable spring of fossil tar, or petroleum, which has yielded a vast quantity of that substance; but it is now much diminished. A work, for obtaining a similar kind of tar, from the condensed smoke of pit-coal, has been erected in the dale.

COLES (Elisha), author of the well-known Latin and English dictionary, was born in Northamptonshire about the year 1640; and was entered at Magdalen College, Oxford, which he left without taking a degree; and taught Latin to young people, and English to foreigners, in London, about the year 1663. He afterwards became an usher in Merchant-tailors' school; but for some great fault, no-where expressly mentioned, he was forced to withdraw to Ireland, from whence he never returned. He was, however, a good critic in the English and Latin tongues; and wrote several useful books of instruction in his profession.

COLESHILL, a town in Warwickshire, with a market on Wednesday. It is seated on the side of a hill, on the Coln, over which is a stone bridge. It is eleven miles N.W. of Coventry. Long. 1. 35. W. Lat. 52. 32. N.

COLESHILL, a village four miles W. of Rickmansworth, in Herts, and in a part of that county which is insulated in Bucks. It was the birth-place of the poet Waller.

COLFORD, a town of Gloucestershire, with a market on Tuesday. It is fourteen miles N. of Hereford. Long. 2. 40. W. Lat. 51. 48. N.

COLIGNI (Gaspard de), admiral of France, was born in 1516. He signalized himself in his youth, in the reigns of Francis I. and Henry II. and was made colonel of infantry and admiral of France in 1552. Henry II. employed him in the most important affairs; but after the death of that prince he embraced the reformed religion, and became the chief of the Protestant party: he strongly opposed the house of Guise,

and rendered this opposition so powerful, that it was thought he would have overturned the French government. On the peace made after the battles of Jarnac and Montcontour, Charles IX. deluded Coligni into security by his deceitful favours; and though he recovered one attempt on his life, when he attended the nuptials of the prince of Navarre, yet he was included in the dreadful massacre of the Protestants on St. Bartholomew's-day 1572, and his body treated with wanton brutality by a misguided Popish populace.

COLLE, an episcopal town of Italy, in Tuscany, ten miles N.W. of Sienna. Long. 11. 7. E. Lat. 43. 16. N.

COLLEGE (*Encycl.*). To the account of different colleges given in our original article, we have to add that of the

Veterinary COLLEGE, the establishment of which does honour to the present reign, reflects infinite credit on its patrons, and certainly merits the sanction and support which have been so liberally conferred upon it.

This college was founded in 1792, for the medical cure and treatment of horses, and for the purpose of instructing pupils in veterinary medicine and surgery.

Mr. St. Bel, an ingenious Veterinarian, who had distinguished himself in France by his skill in the veterinary art, was appointed professor, and the institution was under the direction of a president and twenty-four governors, chosen from the nobility and gentlemen who were zealous in promoting so beneficial a plan. A forge and stabling for fifty horses, with every convenience, were built at Pancras, about two miles on the north side of London. A handsome theatre was also erected, with a museum and dissecting rooms for the purpose of giving lectures to the pupils, and teaching them practical anatomy. A medical committee of assistance was appointed, who undertook to examine the pupils, and grant them certificates when they had acquired sufficient knowledge of the art, to enable them to practise it with success.

The liberal support afforded the institution by the anatomical and medical professors of London, does them great honour, and cannot be too warmly acknowledged by the pupils: they generously allow them to attend their lectures gratis, from which their progress is considerably promoted, and their knowledge greatly improved. The following is the present list of the committee who examine the pupils after their veterinary education is finished, and also suggest or superintend the experiments made at the college for the improvement of the art.

Dr. Fordyce	Dr. Baillie	Mr. Home
Mr. Cline	Mr. Abernethy	Mr. Houlston
Mr. Cooper	Dr. Babington	Dr. Relph.

M. St. Bel died soon after the college had been established, and was succeeded by Mr. Coleman, who has greatly contributed to the improvement of the art, by his extensive knowledge of anatomy and physiology, as well as by his attention to the pupils.

An annual subscriber of two guineas has the privilege of sending two horses to the college when sick or lame, where they receive every medical assistance that may be required, the proprietor paying only for keep. By paying twenty guineas at once, this advantage is made perpetual. For several years parliament has annually contributed to the support of this institution, and his majesty has been pleased to grant commissions in the army to those who qualify themselves in the art, which has tended very materially to its promotion, as well as to render it respectable.

A considerable number of veterinary surgeons have been examined and approved of by the medical committee, who have granted to each a regular *diploma*, under which they now practise in different parts of the kingdom.

COLLEGE of Surgeons, London. The Incorporated Com-

Vol. X.

pany of Surgeons having by an accident lost their charter, the different members were, in 1800, after some struggles with an associated body of surgeons practising pharmacy, re-united by a new charter, under the title of the *Royal College of Surgeons in London*. The new establishment, though in some respects an improvement of the old system, has, nevertheless, some of the defects of the latter.

COLLIER (Jeremy), a learned English nonjuring divine, born in 1650, and educated in Caius College, Cambridge. He had first the small rectory of Ampton, near St. Edmund's Bury, in Suffolk; which in six years he resigned, to come to London, in 1685, where he was made lecturer of Gray's-Inn: but the change of government that followed, soon rendered the public exercise of his function impracticable. He was committed to Newgate for writing against the revolution; and again, for carrying on a correspondence which that change of events made treasonable; but was released both times, without trial, by the intervention of friends. It is observable that he carried his scruples so far, as to prefer confinement to the tacit acknowledgment of the jurisdiction of the court by accepting his liberty upon bail. Suitably to these principles, he next acted a very extraordinary part with two other clergymen of his own way of thinking, at the execution of Sir John Friend and Sir William Perkins for the assassination plot; by giving them solemn absolution, and by imposition of hands: absconding for which, he continued under an outlawry to the day of his death in 1726. These proceedings having put a stop to his activity, he employed his retired hours rather more usefully in literary works. In 1698 he attempted to reform our theatrical entertainments, by publishing his Short view of the immorality and profaneness of the English stage; which engaged him in a controversy with the wits of the time: but as Mr. Collier defended his censures not only with wit, but with learning and reason, it is allowed that the decorum observed, for the most part, by succeeding dramatic writers, has been owing to his animadversions. He next undertook a translation of Moreri's great Historical and Geographical Dictionary; a work of extraordinary labour, and which appeared in 4 vols. folio. After this he published an Ecclesiastical History of Great Britain, chiefly of England, in two vols. folio; which is allowed to be written with great judgment, and even with impartiality. He was besides engaged in several controversies, which his conduct and writing gave rise to, not material to mention. In Queen Anne's reign, Mr. Collier was tempted, by offers of considerable preferment, to a submission; but, as he was a nonjuror upon principle, he could not be brought to listen to any terms.

COLLINS (Anthony), a polemical writer, born at Helfton near Hounslow in the county of Middlesex in 1676, was the son of Henry Collins, a gentleman of about 1500. a-year. He was first bred at Eaton College, and then went to King's College, Cambridge, where he had for his tutor Mr. Francis Hare, afterwards bishop of Chichester. He was afterwards a student of the Temple; but not relishing the law, soon abandoned that study. He was an ingenious man, and author of several curious books. His first remarkable piece was published in 1707, An Essay concerning the Use of Reason in Propositions, the Evidence whereof depends on human Testimony. In 1702 he entered into the controversy between Mr. Clark and Mr. Dodwell, concerning the immortality of the soul. In 1713 he published his discourse on free-thinking; which made a prodigious noise. In 1715 he retired into the county of Essex, and acted as a justice of peace and deputy lieutenant for the same county, as he had done before for that of Middlesex and liberty of Westminster. The same year he published a Philosophical Essay concerning human Liberty. In 1718 he was chosen treasurer of the county

of Essex; and this office he discharged with great honour. In 1724 he published his Historical and critical Essay on the 39 Articles. Soon after, he published his Discourse of the Grounds and Reasons of the Christian Religion; to which is prefixed An Apology for free Debate and Liberty of Writing; which piece was immediately attacked by a great number of writings. In 1726 appeared his Scheme of literal Prophecy considered, in a View of the Controversy occasioned by a late Book entitled, A Discourse of the Grounds, &c. In this discourse he mentions a MS. dissertation of his to shew the Sibylline oracles to be a forgery made in the times of the primitive Christians, who, for that reason, were called *Sibyllists* by the Pagans; but it never appeared in print. His Scheme of literal Prophecy was replied to by several writers; and particularly by Dr. John Rogers in his Necessity of divine Revelation asserted. In answer to which, our author wrote A Letter to the Reverend Dr. Rogers, on Occasion, &c. His health began to decline some years before his death, and he was very much afflicted with the stone, which at last put an end to his life at his house in Harley-square in 1729. He was interred in Oxford chapel, where a monument was erected to him, with an epitaph in Latin. His curious library was open to all men of letters, to whom he readily communicated all the assistance in his power; he even furnished his antagonists with books to confute himself, and directed them how to give their arguments all the force of which they were capable. He was remarkably averse to all indecency and obscenity of discourse; and was, independent of his scepticism, a sincerely good man.

COLLINS (John), an eminent accountant and mathematician, born in 1624, and bred a bookeller at Oxford. Besides several treatises on practical subjects, he communicated some curious papers to the Royal Society, of which he was a member, which are to be found in the early numbers of their Philosophical Transactions: and was the chief promoter of many other scientific publications in his time. He died in 1683; and about twenty-five years after, all his papers coming into the hands of the learned William Jones, esq. F.R.S. it appeared that Mr. Collins held a constant correspondence for many years with all the eminent mathematicians; and that many of the late discoveries in physical knowledge, if not actually made by him, were yet brought forth by his endeavours.

COLLINA (*Encycl.*), placed erroneously between the articles *COLLATINA* and *COLLATION*.

COLLUMPTON, a town of Devonshire, with a market on Thursday. It is seated on a river near the sea, ten miles N. of Exeter, and 150 W. by S. of London. Long. 3. 29. W. Lat. 50. 54. N.

COLN, a river of Essex, which rises near Clare in Suffolk, and passing by Halstead and Colchester, empties itself into the German Ocean, between Mersey Island and the main land. In the salt-water inlets and pools, at the mouth of this river, are bred the famous Colchester oysters.

COLN, a river which rises near Sevenhampton in Gloucestershire, flows S.E. to Fairford, and falls into the Thames at Lechlade.

COLN, a river which rises in Herts, and dividing Middlesex from Bucks, fall into the Thames above Staines.

COLOMB, St. a town in Cornwall, with a market on Thursday. It is seated on a hill, at the bottom of which is a river, which falls into the sea at a small distance. It is ten miles W. of Bodmin. Long. 4. 52. W. Lat. 50. 30. N.

COLOMBOTZ, a castle of Turkey in Europe, in Bulgaria, on a hill, under which is the strong pass of Urania.

COLOOR, a diamond mine of the peninsula of Hindoostan, near the fort of Condavir, in the Guntoor Circar.

COLUBER (*Encycl.*), erroneously spelt **COLUBE**.

COLUMBANUS (St.), a Latin poet, was born in Ireland in 560. He retired from the world, and lived a solitary life in the mountains of Wales for some years. He next went over to France and built a monastery; but, being exiled from that country, he travelled to Italy, where he founded the abbey of Bobbio, and died in it in 615.

COLUMNA, a town of the Russian empire, in the government of Moscow, with an archbishop's see; fifty miles S.E. of Moscow. Long. 38. 25. E. Lat. 55. 5. N.

COMACCHIO, an episcopal town of Italy, in the Ferrarese. The air is bad, for which reason it is inhabited by a few fishermen only. It is twenty-seven miles S.E. of Ferrara. Long. 12. 10. E. Lat. 44. 45. N.

COMACHIO, a lake of the Ferrarese, in Italy, between the two mouths of the river Po; and about ten miles in circumference; but dry in several places. On one side of this lake the town of the same name is built.

COMANA, a sea-port of South America, the capital of New Andalusia, in Terra Firma. It is defended by a strong castle. Long. 64. 20. W. Lat. 10. 10. N.

COMANAGOTTA, a town of South America, in Terra Firma, ten miles W. of Comana. Long. 64. 40. W. Lat. 10. 10. N.

COMB ABBEY, a village in Warwickshire, three miles from Coventry, once famous for a rich abbey. The church is demolished; but the abbey, with some modern improvements, is the seat of Lord Craven.

COMB-MARTIN, a town of Devonshire, with a market on Tuesday. It is seated on the Bristol Channel, where it has an inlet which runs through the town. It is seven miles E. of Ilfracombe. Long. 4. 2. W. Lat. 51. 13. N.

COMBER, or **CUMBER** (Thomas), an eminent divine, born at Westram in Kent, in 1645, was educated at Cambridge; created doctor of divinity; and, after several preferments in the church, was made dean of Durham. He was chaplain to Anne princess of Denmark, and to King William and Queen Mary. He was author of several works, viz. 1. A scholastical History of the primitive and general Use of Liturgies. 2. A Companion to the Altar. 3. A brief Discourse upon the Offices of Baptism, Cathedrism, and Confirmation. He died in 1699, aged fifty-five.

COMENIUS (John Amos), a grammarian and Protestant divine, born in Moravia in 1592. He was eminent for his design to introduce a new method of teaching languages; for which purpose he published some essays in 1616, and had prepared some others, when the Spaniards pillaged his library, after having taken the city of Fulneck, where he was minister and master of the school. Comenius fled to Lesna, a city of Poland, and taught Latin there. The book he published in 1631, under the title of *Janua Linguarum reſerata*, gained him a prodigious reputation, inasmuch that he was offered a commission for regulating all the schools in Poland. The parliament of England desired his assistance to regulate the schools in that kingdom. He arrived at London in 1641; and would have been received by a committee to hear his plan, had not the parliament been taken up with other matters. He therefore went to Sweden, being invited by a generous patron, who settled a stipend upon him that delivered him from the fatigues of teaching; and now he employed himself wholly in discovering general methods for those who instructed youth. In 1657 he published the different parts of his new method of teaching. He was not only taken up with the reformation of schools, but he also filled his brain with prophecies, the fall of Antichrist, Millennium, &c. At last Comenius took it into his head to address Lewis XIV. of France, and to send him a copy of the prophecies of Drabicius; insinuating that it was to this monarch God promised the empire of the world. He

became sensible at last of the vanity of his labours, and died in 1871.

COMETEAU (*Encycl.*). Erroneously spelt COMETAN.

COMO, the largest lake in Italy, in the duchy of Milan. It is 88 miles in circumference, but is not above six miles over in any one part.

COMMANDINUS (Frederic), born at Urbino in Italy, and descended from a very noble family, in the 16th century. To a vast skill in the mathematics, he had added a great knowledge in the Greek tongue, by which he was well qualified to translate the Greek mathematicians into Latin. Accordingly he translated and published several, which no writer till then had attempted; as Archimedes, Apollonius, Euclid, &c.

COMMISSARY-COURT, in Scotland, a court originally constituted by the bishops for executing in their name an usurped jurisdiction; and was anciently called the bishop's-court, *cursu Christianitatis*, or consistorial court. This court was modelled by Queen Mary at the reformation, and continues to this day.

COMMIXTION, in Scots law, is a method of acquiring property, by mixing or blending together different substances belonging to different proprietors.

COMMODIANUS (Gazeus), a Christian author in the 4th century, who wrote a work in Latin verse, entitled *Instructio*; the moral of which is excellent, but the verse extremely heavy. M. Davies published a fine edition of it, in 1711, at the end of Minucius Felix.

COMMONTY, in Scots law, sometimes signifies land belonging to two or more common proprietors; sometimes a heath or muir though it should belong in property to one, if there has been a promiscuous possession upon it by pasturage; and the act in 1695 mentions commonities belonging in property to the king and the royal boroughs.

COMMENA (Ann) (*Encycl.*). Erroneously spelt COMMENA. COMPIEGNE, a handsome town of France, in the department of Oise and late province of the Isle of France. It is seated near an extensive forest, at the confluence of the Aisne and Oise. Here is a palace, in which the kings of France often resided. The Maid of Orleans was taken prisoner here in 1430. It is 45 miles N.E. of Paris. Long. 2. 55. E. Lat. 49. 25. N.

CONANT (Dr. John), a learned English divine, born in 1608. He took his degrees at Exeter College, Oxford; was, by the parliament, constituted one of the assembly of divines, though he seldom, if ever, sat with them; and in 1657 was admitted vice-chancellor of the university. On the restoration he was one of the commissioners, and assisted at the conferences in the Savoy; but was deprived by the act of uniformity: after eight years he was confirmed, and was made arch-deacon of Norwich, and prebendary of Worcester. In 1686 he lost his sight; and died in 1693; leaving a number of admired sermons, afterwards published in six volumes.

CONCAN, a low tract of country, on the W. coast of the Deccan of Hindoostan. From this tract rises abruptly that stupendous wall of mountains called the Gats. It is subject to the Mahrattas, and lies between 15° and 20° N. lat.

CONCATENATION, a term chiefly used in speaking of the mutual dependence of second causes upon each other.

CONDAVIR, a fort in the peninsula of Hindoostan, the principal post of Guntoor, one of the five Northern Circars. It is strongly situated on a mountain, 16 miles W. of Guntoor, and 20 from the S. bank of the Kistna.

CONDEDO, a cape of North America, in Yucatan, 100 miles W. of Merida. Long. 91. 27. W. Lat. 20. 50. N.

CONDORE, the capital of a number of islands, in the Indian Ocean, which lie in 8. 40. N. lat. 60 miles S. by E.

from the mouth of the river Cambodia. The mangoes grow on trees, as large as apple-trees: the fruit is of the size of a small peach, and when ripe, has a pleasant smell and taste. Pickled mangoes are now well known in England. The inhabitants are small in stature, well shaped, and of a dark olive complexion; their faces are long, with black straight hair, small black eyes, high noses, thin lips, white teeth, and little mouths. They are very poor, and their chief employment is getting tar out of the trees. When any ships arrive, they will bring their women on board and offer them to the sailors. They have a little idol temple, built of wood, and thatched like their houses, which are very mean. The English East-India company had a settlement here in 1702; but the factors falling out with the natives, most of them were murdered, and the rest driven thence in 1705. Long. 117. 26. E. Lat. 2. 40. N.

CONEOLENS, a town of France, in the department of Charente, and late province of Angoumois, on the river Vienne, 30 miles N.E. of Angoulême. Long. 0. 43. E. Lat. 46. 55. N.

CONFUSION of Tongues. By this phrase is generally understood that miraculous interposition of the Deity mentioned in the book of Genesis, to cause mankind to desist from their attempt to build the tower of Babel, and to make them separate, and divide themselves into different nations.

It hath been much disputed whether there were more languages than one before the flood; and many arguments have been adduced by learned men on both sides. This question, however, it is easy to see, can never be determined; but whether it was so or not, it is plain there must have been but one for some time after the flood, as all mankind were descended from one family. As to the confusion of tongues and dispersion of mankind, it is an event mentioned by profane as well as the sacred historians. They write that mankind used one and the same language till the overthrow of the tower of Babylon; at which time a multiplicity of tongues was introduced by the gods: whereupon wars ensued, and those whose speech happened to be intelligible to one another, joined company, and seized the countries they chanced to light upon.

With regard to the manner, however, in which this confusion was effected, there is a great variety of sentiments. Several learned men, prepossessed with an opinion that all the different idioms now in the world did at first arise from one primitive language to which they may be reduced, and that the variety which we find among them is no other than what must naturally have taken place in so long course of time, have thence been induced to believe that there were no new languages formed at the confusion, but that the most that was done at that time was only to fet the builders of Babel at variance with one another by creating a misunderstanding among them. This some imagine to have been effected without any immediate influence on their language; which seems contrary to the words and obvious intention of the sacred historian. Others have imagined it brought about by a temporary confusion of their speech, or rather of their apprehensions, causing them, while they continued together, and spake the same language, yet to understand the words differently. A third opinion is, that a variety of inflexions was introduced, and perhaps some new words, which disturbed and perverted the former manner of expression. But this, though it might occasion different dialects, yet could not create new languages; and seems not to answer the intention of Moses, which was to inform us not only how mankind were at first dispersed into so many nations, but to account for their different languages; a thing very difficult if not impossible to be done, without having recourse to the immediate interposition of divine power. For though time, intercourse with foreign nations, commerce, the

invention and improvement of arts and sciences, and the difference of climates, cause very considerable alteration in languages, yet the utmost effect we can imagine them to have will not come up to the point in question. Upon the whole, therefore, it seems most probable, that on the confusion at Babel there were new languages formed; and that these languages were the roots of all others that are, that have been, or that will be spoken while the world remains.

In what manner these new languages were formed, is a matter not easy to be determined. From the manner in which this event is related by Moses, some have concluded that God effected it by immediately inducing an oblivion of their former tongue, and instantaneously infusing others into their minds. The Jews imagined this to be done by the ministry of angels, 70 of whom descended with God, and were each of them set over a nation, to whom they taught a peculiar language; but that the ancestors of the Jewish nation retained the primitive language. Others have supposed, that God did no more than cause them to forget their old language, leaving them to form new ones in the best manner they could; but this must have taken up some time, and could but ill have answered the necessities of mankind; and the way in which Moses expresses himself seems to imply that it was done instantaneously.

As to the number of different languages formed at this time, we are no less in the dark than as to the manner in which they were formed. It is most probable, that the languages of the chief families were fundamentally different from each other, and that the sub-languages or dialects within each branch, for the sake of immediate intercourse, had a mutual affinity, some more, and some less, according as they settled nearer or further from each other; which was sufficient to bring about the designs of God, divide mankind into distinct societies, and open a new scene of Providence, by which his wisdom might display itself in the government of the world.

CONGLETON, a town of Cheshire, with a market on Saturday. It is seated on the river Dane, and a large mayor town, though it has nothing but a chapel of ease, the church being two miles distant. It has a manufactory of leather gloves; and a more considerable one in silk, there being a large silk-mill, which employs 700 hands. It is seven miles from Macclesfield, and 164 N.W. of London. Long. 2. 10. W. Lat. 53. 8. N.

CONGRUITY (*Encycl.*). In order to give a full view of the secondary relations, spoken of in our original article, we shall trace them through some of the most considerable primary relations. The relation of a part to the whole, being extremely intimate, demands the utmost degree of congruity; even the slightest deviation is disagreeable.

Examples of congruity and incongruity are furnished in plenty by the relation between a subject and its ornaments. A literary performance intended merely for amusement, is susceptible of much ornament, as well as a music-room or a play house; for in gaiety, the mind hath a peculiar relish for show and decoration. The most gorgeous apparel, however improper in tragedy, is not unsuitable to opera-actors: the truth is, an opera, in its present form, is a mighty fine thing; but as it deviates from nature in its capital circumstances, we look not for nature or propriety in those which are accessory. On the other hand, a serious and important subject admits not much ornament; nor a subject that of itself is extremely beautiful: and a subject that fills the mind with its loftiness and grandeur, appears best in a dress altogether plain.

To a person of a mean appearance, gorgeous apparel is unsuitable; which besides the incongruity has a bad effect; or by contrast it shews the meanness of appearance in the

strongest light. Sweetness of look and manner, requires simplicity of dress, joined with the greatest elegance. A stately and majestic air requires sumptuous apparel, which ought not to be gaudy, nor crowded with little ornaments. A woman of consummate beauty can bear to be highly adorned, and yet shews best in a plain dress:

For loveliness

Needs not the foreign aid of ornament,
But is when unadorn'd, adorned the most.

Thomson's Autumn, 208.

Congruity regulates not only the quantity of ornament, but also the kind. The ornaments that embellish a dancing-room ought to be all of them gay. No picture is proper for a church, but what has religion for its subject. All the ornaments upon a shield ought to relate to war; and Virgil, with great judgment, confines the carvings upon the shield of Æneas to the military history of the Romans: but this beauty is overlooked by Homer; for the bulk of the sculpture upon the shield of Achilles, is of the arts of peace in general, and of joy and festivity in particular: the author of Telemachus betrays the same inattention, in describing the shield of that young hero.

In judging of propriety with regard to ornaments, we must attend, not only to the nature of the subject that is to be adorned, but also to the circumstances in which it is placed: the ornaments that are proper for a ball, will appear not altogether so decent at public worship; and the person ought to dress differently for a marriage-feast and for a burial.

Nothing is more intimately related to a man, than his sentiments, words, and actions; and therefore we require here the strictest conformity. When we find what we thus require, we have a lively sense of propriety: when we find the contrary, our sense of impropriety is not less lively. Hence the universal distaste of affectation, which consists in making a shew of greater delicacy and refinement than is suited either to the character or circumstances of the person.

Congruity and propriety, wherever perceived, appear agreeable; and every agreeable object produceth in the mind a pleasant emotion: incongruity and impropriety, on the other hand, are disagreeable; and of course produce painful emotions. These emotions, whether pleasant or painful, sometimes vanish without any consequence; but more frequently occasion other emotions, which we proceed to exemplify.

When any slight incongruity is perceived, in an accidental combination of persons or things, as of passengers in a stage-coach, or of individuals dining at an ordinary; the painful emotion of incongruity, after a momentary existence, vanisheth without producing any effect. But this is not the case of propriety and impropriety: voluntary acts, whether words or deeds, are imputed to the author; when proper, we reward him with our esteem; when improper, we punish him with our contempt. Let us suppose, for example, a generous action suited to the character of the author, which raises in him and in every spectator the pleasant emotion of propriety: this emotion generates in the author both self-esteem and joy; the former when he considers his relation to the action, and the latter when he considers the good opinion that others will entertain of him: the same emotion of propriety produceth in the spectators esteem for the author of the action; and when they think of themselves, it also produceth, by means of contrast, an emotion of humility. To discover the effects of an unsuitable action, we must invert each of these circumstances: the painful emotion of impropriety generates in the author of the action both humility and shame; the former when he considers his relation to the action, and the latter when he considers what others will think of him: the same emotion of improp-

propriety produceth in the spectators contempt for the author of the action; and it also produceth, by means of contrast, when they think of themselves, an emotion of self-esteem. Here then are many different emotions, derived from the same action considered in different views by different persons; a machine provided with many springs, and not a little complicated. Propriety of action, it would seem, is a chief favorite of nature, when such care and solicitude is bestowed upon it. It is not left to our own choice; but, like justice, is required at our hands; and, like justice, is enforced by natural rewards and punishments: a man cannot, with impunity, do any thing unbecoming or improper; he suffers the chastisement of contempt inflicted by others, and of shame inflicted by himself. An apparatus so complicated, and so singular, ought to rouse our attention: for nature doth nothing in vain; and we may conclude with great certainty, that this curious branch of the human constitution is intended for some valuable purpose.

A gross impropriety is punished with contempt and indignation, which are vented against the offender by corresponding external expressions: nor is even the slightest impropriety suffered to pass without some degree of contempt. But there are improprieties, of the slighter kind, that provoke laughter; of which we have examples without end, in the blunders and absurdities of our own species: such improprieties receive a different punishment, as will appear in what follows. The emotions of contempt and of laughter occasioned by an impropriety of this kind, uniting intimately in the mind of the spectators, are expressed externally by a peculiar sort of laugh, termed a *laugh of derision* or *scorn*. An impropriety that thus moves not only contempt but laughter, is distinguished by the epithet of *ridiculous*; and a laugh of derision or scorn is the punishment provided for it by nature. Nor ought it to escape observation, that we are so fond of inflicting this punishment as sometimes to exert it even against creatures of an inferior species: witness a turkeycock swelling with pride, and strutting with displayed feathers; a ridiculous object, which in a gay mood is apt to provoke a laugh of derision.

We must not expect, that these different improprieties are separated by distinct boundaries: for of improprieties, from the slightest to the most gross, from the most risible to the most serious, there are degrees without end. Hence it is, that in viewing some unbecoming actions, too risible for anger, and too serious for derision, the spectator feels a sort of mixed emotion, partaking both of derision and of anger; which accounts for an expression, common with respect to the impropriety of some actions, that we know not whether to laugh or be angry.

It cannot fail to be observed, that in the case of a risible impropriety, which is always slight, the contempt we have for the offender is extremely faint, though derision, its gratification, is extremely pleasant. This disproportion between a passion and its gratification, seems not conformable to the analogy of nature. In looking about for a solution, we must reflect upon what is laid down above, that an improper action not only moves our contempt for the author, but also, by means of contrast, swells the good opinion we have of ourselves. This contributes, more than any other article, to the pleasure we have in ridiculing follies and absurdities; and accordingly, it is well known, that they who put the greatest value upon themselves are the most prone to laugh at others. Pride, which is a vivid passion, pleasant in itself, and not less so in its gratification, would singly be sufficient to account for the pleasure of ridicule, without borrowing any aid from contempt. Hence appears the reason of a noted observation, That we are the most disposed to ridicule the blunders and absurdities of others, when we are in high spirits; for in high spirits, self-conceit displays itself with more than ordinary vigour.

With regard to the final causes of congruity, and impropriety; one, regarding congruity, is pretty obvious, that the sense of congruity, as one principle of the fine arts, contributes in a remarkable degree to our entertainment. Congruity, indeed, with respect to quantity, coincides with proportion: when the parts of a building are nicely adjusted to each other, it may be said indifferently, that it is agreeable by the congruity of its parts, or by the proportion of its parts. But propriety, which regards voluntary agents only, can never be the same with proportion: a very long nose is disproportioned, but cannot be termed *improper*. In some instances, it is true, impropriety coincides with disproportion in the same subject, but never in the same respect; for example, a very little man buckled to a long toledo: considering the man and the sword with respect to size, we perceive a disproportion; considering the sword as the choice of the man, we perceive an impropriety.

The sense of impropriety with respect to mistakes, blunders, and absurdities, is happily contrived for the good of mankind. In the spectators, it is productive of mirth and laughter, excellent recreation in an interval from business. But this is a trifle in respect of what follows. It is painful to be the subject of ridicule; and to punish with ridicule the man who is guilty of an absurdity, tends to put him more upon his guard in time coming. Thus even the most innocent blunder is not committed with impunity; because, were errors licensed where they do no hurt, inattention would grow into a habit, and be the occasion of much hurt.

The final cause of propriety as to moral duties, is of all the most illustrious. To have a just notion of it, the moral duties that respect others must be distinguished from those that respect ourselves. Fidelity, gratitude, and the forbearing injury, are examples of the first sort; temperance, modesty, firmness of mind, are examples of the other: the former are made duties by the sense of justice; the latter, by the sense of propriety. Here is a final cause of the sense of propriety, that must rouse our attention. It is undoubtedly the interest of every man, to suit his behaviour to the dignity of his nature, and to the station allotted him by Providence; for such rational conduct contributes in every respect to happiness, by preserving health, by procuring plenty, by gaining the esteem of others, and which of all is the greatest blessing, by gaining a justly-founded self-esteem. But in a matter so essential to our well-being, even self-interest is not relied on: the powerful authority of duty is superadded to the motive of interest. The God of nature, in all things essential to our happiness, hath observed one uniform method: to keep us steady in our conduct, he hath fortified us with natural laws and principles, which prevent many aberrations, that would daily happen were we totally surrendered to so fallible a guide as is human reason. Propriety cannot rightly be considered in another light, than as the natural law that regulates our conduct with respect to ourselves; as justice is the natural law that regulates our conduct with respect to others. We call propriety a law, not less than justice; because both are equally rules of conduct that ought to be obeyed: propriety includes this obligation; for to say an action is proper, is in other words, to say, that it *ought* to be performed; and to say it is improper, is, in other words, to say that it ought to be forborne. It is this very character of *ought* and *should* that makes justice a law to us; and the same character is applicable to propriety, though perhaps more faintly than to justice: but the difference is in degree only, not in kind; and we ought, without hesitation or reluctance, to submit equally to the government of both.

But it must, in the next place, be observed, that to the sense of propriety, as well as of justice, are annexed the sanctions of rewards and punishments; which evidently prove the one to

be a law as well as the other. The satisfaction a man hath in doing his duty, joined with the esteem and good-will of others, is the reward that belongs to both equally. The punishments also, though not the same, are nearly allied; and differ in degree more than in quality. Disobedience to the law of justice, is punished with remorse; disobedience to the law of propriety, with shame, which is remorse in the lower degree. Every transgression of the law of justice raises indignation in the beholder; and so doth every flagrant transgression of the law of propriety. Slighter improprieties receive a milder punishment: they are always rebuked with some degree of contempt, and frequently with derision. In general, it is true, that the rewards and punishments annexed to the sense of propriety, are slighter in degree than those annexed to the sense of justice: which is wisely ordered, because duty to others is still more essential to society, than duty to ourselves; for society could not subsist a moment, were individuals not protected from the headstrong and turbulent passion of their neighbours.

CONINGTON, a village in Huntingdonshire, near Sliton, at the head of the river which forms Ug-mere, Brick-mere, and Whittefeam-ere. It has the ruins of a castle; and in a pool, just by the village, was found the skeleton of a fish, near 20 feet long, in a perfect state, six feet below the surface of the ground.

CONISTON MERE, a considerable lake of Lancashire, in the hundred of Furness. It affords plenty of char.

CONNER (Bernard), a learned physician, was born in the county of Kerry, in Ireland, about the year 1666. Having determined to apply himself to the study of physic, he went to France, and resided some time in the university of Montpellier. Afterwards he went to Paris; where he obtained great skill in medicine, anatomy, and chemistry. From thence he travelled to Venice, with the two sons of the high-chancellor of Poland; and then taking a tour through great part of Germany, went to Warlaw, where he was made physician to King John Sobieski. In 1695 he came to England, read a course of lectures in London and Oxford, and became member of the Royal Society and College of Physicians; afterwards, being invited to Cambridge, he read public lectures there, and made various experiments in chemistry. He has rendered himself memorable for a philosophical and medical treatise in Latin, entitled, *Evangelium Medici*, i. e. "The Physician's Gospel;" tending to explain the miracles performed by Christ, as natural events, upon the principles of natural philosophy. He wrote also a history of Poland; and died in 1698, aged 32.

CONQUET, a handsome town of France, in the department of Finistère, and late province of Bretagne, with a good harbour and road. It is 12 miles W. of Brest. Long. 4. 41. W. Lat. 48. 23. N.

CONRAD II. elected Emperor of Germany in 1004. He was obliged to take the field against most of the German dukes who had revolted from him; and he put Earnest duke of Suabia under the ban of the empire. This being one of the earliest instances of such a proscription, the formula is inserted here for its singularity. "We declare thy wife a widow, thy children orphans; and we fend thee, in the name of the devil, to the four corners of the world." It was in the reign of this prince that the German fiends became hereditary. He died in 1039.

CONRAD III. Emperor of Germany in 1138. The Duke of Bavaria opposed his election, and being put under the ban of the empire, and deprived of his duchy, he could not survive his disgrace. The margrave of Austria was ordered by the emperor to take possession of Bavaria; but Welfi, uncle to the deceased duke, attacked him, and was defeated near the castle of Winburgh: the battle fought upon this occasion is

famous in history, as having given rise to the party-names of Guelphs and Gibbelines, afterwards assumed, in Italy. The parole of the day with the Bavarians was *Welfi*, from the name of their general; that of the Imperialists *Werlingen*, from a small village where Frederic duke of Suabia, their commander, had been nursed: by degrees their names served to distinguish the two parties; and the Italians, who could not accustom themselves to such rough words, formed from them their Guelphs and Gibbelines. He died in 1152.

CONRAD of Lichtenau, or Abbas Uipergenensis, was author of an universal chronology from the creation to 1229, continued by an anonymous writer to Charles V. He collected a fine library, and died about the year 1240.

CONRADIN, or **CONRAD junior**, son of Conrad IV. was acknowledged emperor by the Gibbelines, who received him in triumph at Rome: but Pope Alexander IV. had published a crusade against this orphan; and Urban VII. his successor, gave the empire to Charles of Anjou, brother to Lewis IX. king of France: and the unfortunate youth, though powerfully supported, even by the Turks, lost a battle, in which he was taken prisoner, and was beheaded, by order of his base opponent, publicly at Naples in 1239, in the 18th year of his age. In him ended the race of the dukes of Suabia, which had produced several kings and emperors.

CONSTANTINE, emperor of the East in 1002, left the care of the empire to his wife Helena, who loaded the people with taxes, and sold all the offices in church and state to the highest bidders; while the emperor employed himself in reading, writing, and the fine arts, till he became as good an architect and painter, as he was a bad prince. He wrote several biographical and geographical works, which would have done honour to his name, if he had not neglected his duty to compose them. He died in 959.

CONSTANTINE (Dracofes), the son of Emmanuel Paleologus, was placed on the throne by Sultan Amurath in 1448. But Mahomet II. his successor, resolving to dethrone him, laid siege to Constantinople by sea and land, and took it by assault in 1453, after it held out 58 days. The unfortunate emperor seeing the Turks enter the breaches, threw himself into the midst of the enemy, and was cut to pieces; the children of the imperial house were massacred by the soldiers; and the women reserved to gratify the lust of the conqueror: and thus terminated the dynasty of the Constantines, 1123 years after its establishment at Constantinople.

CONSTANTINE (Robert), a learned physician, born at Caen, taught polite literature in that city; and acquired great reputation by his skill in the Greek language, in history, and in medicine. He died in 1603, aged 103. He wrote a dictionary in Greek and Latin, and other works, which are esteemed.

CONSTANTINOW, a town of Poland, in Volhinia, on the river Seluza, 62 miles N.E. of Kamienieck. Long. 27. 20. E. Lat. 49. 58. N.

CONVALESCENT, a person in a progressive state of recovery, after a fit of sickness, by which his strength and flesh have been greatly reduced. The poor, who cannot, with propriety, be continued in the public hospitals after the disease is at an end, endure much distress on that account. In the year 1791 a society was established by some of the governors of the London hospital, for patients of that charity, whose relief was not within its general regulations. There had been many cases of servants, artisans, and labourers, who had received the benefit of the hospital; but, upon being discharged, had no service or employment ready for them, or, if there had been such, were not sufficiently recovered, in point of health and strength, to resume their places or employment. There had been cases of amputation or of some chirological operation, where the parties were disabled from exercising

their former occupations. Some instances had occurred of young female patients, who by distrefs had been driven to pawn or sell their clothing, and were peculiarly exposed to temptation; of persons whose families had been suffering for want of support: of others belonging to remote parts of the kingdom, or to Ireland, who when discharged from the hospital, were, by lameness or weakness, rendered incapable of getting home without charitable assistance. There were some instances where the means of a journey to the charitable establishment at Bath, or to the sea, or the immediate supply of linen, of clothes, or of a truss, might have saved a fellow-creature from distrefs, and restored him in health to his family.

For the relief of these, and of other persons not within the provisions of hospitals, the Samaritan Society was established; and the following regulations were adopted, which we give at length, because they may be of use in forming similar societies:—"1st. A donation of five guineas shall be a qualification for a member for life.—2d. A donation of one guinea shall be a qualification of an annual member.—3d. A general court shall be held half-yearly, on the last Wednesdays in February and August, and shall consist of not less than five members.—4th. A treasurer, and a committee, to consist of not less than twelve members besides the treasurer, shall be annually elected at the general court in February: two of the committee shall go out annually, and two other members be chosen in their place.—5th. A committee shall be held every Tuesday, at 12 o'clock; and shall consist of not less than two members.—6th. Qualified persons shall be proposed at one committee, and voted for at the next.—7th. The committee shall appoint one or more visitors; who shall make enquiries of the officers, or other persons in the hospital, concerning the distrefsful circumstances of the patients, and report to the next committee accordingly.—8th. No recommendation from any person whatever, whether a member of the society or not, shall be regarded further than as it may be explanatory of the distrefs of the object under consideration, and as it may thence assist the committee in their proceedings.—9th. The proceedings of the society shall be exactly recorded; together with the names of all persons relieved, their age, place of nativity, parish, occupation, whether they are married or single, the state of their family, or any circumstance claiming the particular consideration of the society, as well as the relief granted.—10th. The names of, at least, two members of the committee, by order of the committee, shall be subscribed to drafts upon the treasurer.—11th. An exact account of the receipts, disbursements, and fund, of the society, shall be laid before every committee; which shall audit and sign the same, and send an abstract thereof annually to every member.—12th. The treasurer, and two other members, appointed at a general court, shall be trustees for investments in the funds.—13th. All legacies and donations, above one guinea, shall be added to the invested fund, which shall be inviolable.—14th. The expenditure of each year shall by no means exceed the annual income arising from the interest of the invested fund, and those donations which do not exceed one guinea; nor shall any debts be incurred, so as to anticipate the receipts of the society.—15th. Rules for the government of the society, shall be approved by one general court, and confirmed by the next; the members being informed of every approved regulation, at least six days before the general court, at which its confirmation shall be considered.—16th. At general courts and committees, questions shall be determined by a majority, the chairman having a casting vote; and if a ballot should be demanded by two members, it shall be proceeded upon immediately.—17th. The treasurer, the assembled committee, or

any five members of the society, shall have power to call extraordinary general courts."

The society consists of about 50 annual subscribers of one guinea each, and about 70 members for life, who have given donations of 5 guineas each. From the first institution of the society in 1791, to 5th September, 1798, as many as 221 distrefsed persons have been relieved, and put in a course of livelihood, who must otherwise have been driven to beggary, if not to criminal courses, for subsistence.

In March 1795 the society had the satisfaction to find that the good effects of this establishment had been experienced by many poor patients in the London hospital; who, after they had been cured of their diseases, and were in a state of convalescence, had been supplied with necessaries, and enabled to return home, and renew their occupations. The benefit had not been less to their wives and families; to whom occasional and seasonable relief had been administered, during the sickness and confinement of the patient. The utility and propriety of the charity seemed to be now unequivocally established. The committee therefore determined to recommend it as an appendage not only to every hospital, but also to every county gaol; in the latter instance, as the means, not merely of preserving delinquents from distrefs, but of restoring them to character, and to habits of occupation; there being frequent instances that persons, though not yet confirmed in vicious courses, might otherwise have been driven back to the commission of crimes, for the mere protraction of existence.

A circumstance which contributed very much to the establishment of this society deserves to be mentioned, as it exemplifies the cases which have been relieved by it. One of the members of this society passing along the Uxbridge road, observed a man of very decent appearance, reclined on a bank by the way side, with a pair of crutches near him. His account of himself was (and we have no reason whatsoever to question the truth of it), "that he was a Gloucestershire manufacturer; that he had been a short time in London, where he had the misfortune to break his leg, and had been admitted a patient into an hospital; that his leg had been very well set, and all proper care had been taken of him; and, upon his discharge that morning, some gentleman, he said, had kindly given him a shilling, on part of which he had subsisted so far; that he was going to his parish in Gloucestershire, but had not the means of paying for his carriage in the waggon." This story was not related in vain.—We leave it to the reader's consideration, what course of life remained to this poor man (had he not unexpectedly met with friendly assistance) but to beg,—to steal,—or to perish.

Amidst the great variety of charities, for which this age and kingdom are distinguished, it is extraordinary, that the provision, which is the subject of this article, should have experienced so little attention; and it is the more surprising, because upon the first institution of the charities, which were intended to provide for part of the inconveniences from the abolishing of monasteries, the utility of such an establishment appears to have been strongly impressed on the minds of the original projectors. In the declaration made to the privy-council, by the citizens of London, in the reign of Edward the Sixth, concerning the uses to which Bridewell, and the two other great foundations of Christ's and St. Thomas's hospitals, were to be applied, one of the three objects of Bridewell is expressed to be, "for the sore and the sick when they be cured;" in order that they may be protected and employed until their entire recovery: and "not be suffered to wander as vagabonds in the commonwealth, as they had been accustomed."

This part, however, of the original intentions of the projectors of that institution has not been yet carried into effect, as a committee of the governors of that hospital is now sitting, for the purpose of enquiring "whether, and by what means, the estates and revenues of the house of Bridewell can be appropriated with greater effect than at present to the benefit of its original and proper objects." The following is a short extract from three of a series of propositions, made by one of the members of the committee, and since printed by their order, and entered as resolutions on their minutes.

"That there are many deserving and necessitous persons, who, at the time of their being discharged from hospitals, are without the power of labour, or the means of support; and who, for want of that establishment which was one of the original objects of Bridewell, have been driven to solicit the charity of the public, as street beggars. That, such is the infirmity of human nature, they who have first discovered a successful and easy trade, are not likely, of themselves, to discontinue it, and to return to a course of labour; and, if the pauper does not receive charitable relief in his distress, he is sometimes induced to prey upon the public for his subsistence; and, to use the language of the rules of the house of Bridewell drawn up in 1557, *being set at liberty in the highways, is made of a sick beggar a whole thief.*" These persons, it is to be observed, will require, and that only for a short time, an asylum, where, being many of them artisans instructed in a trade, and almost all of them habituated to employment, their earnings would in general be more than what the cost of their diet, if economically managed, would amount to: and there is reason to hope, that the number of persons wanting this relief, would very soon be diminished by the proper application of it; and that the hospitals in the metropolis would be thereby greatly relieved; as it is a known fact that many patients, for want of the means of *entire recovery* of health and strength on quitting one hospital, have soon been obliged to apply for admission even into another."

CONVERSANO, a town of the kingdom of Naples, with a bishop's see, 10 miles from the gulf of Venice, and 12 S.E. of Bari. Long. 17. 6. E. Lat. 41. 20. N.

CONWAY, VALE OF, a long and narrow tract of Carnarvonshire. It is equally romantic and beautiful; affords rich pasturage, corn-fields, and groves; and forms a pleasing contrast to the bleak region of Snowdon frowning above it.

CONWAY, a river of North Wales, which flows through the vale of the same name, along the whole eastern border of Carnarvonshire, and enters the Irish Sea at the town of Conway.

COOK'S RIVER, a large river of North America, which flows into the N. Pacific Ocean. It was discovered by Captain Cook in 1778. As he left a blank for its name, it was filled up, after his death, by direction of the late Earl of Sandwich. This river was traced as high as lat. 61. 30. N. long. 150. 0. W. which is above 70 leagues from its mouth.

COOK'S STRAIT, a strait in the S. Pacific Ocean, dividing the two large islands of which New Zealand is composed: it is about four or five leagues broad.

COOPER (Samuel), a very eminent English miniature painter, born in 1609, and bred under the care of his uncle John Holkins. He derived, however, his principal excellence from a study of the works of Van Dyck, in whose time he lived; inasmuch that he was commonly styled "Van Dyck in little." His pencil was chiefly confined to the head, in which with all its dependences, especially the hair, he was inimitable; but if he descended lower, his incorrectness was notorious. He died in 1672; and his pieces are universally admired all over Europe, selling for

incredible prices.—He had a brother, Alexander, likewise a good miniature painter, who became limner to Christiana queen of Sweden.

COOPER (Thomas), a pious and learned prelate in the reign of Queen Elizabeth, was born at Oxford about the year 1517. He was educated in the school adjoining to Magdalen College, of which he was a chorister; where also, in 1539, he was elected probationer, and fellow in the following year. About the year 1546, quitting his fellowship, he applied himself to the study of physic, in 1556 took the degree of bachelor in that faculty, and practised as physician at Oxford. Being inclined to the Protestant religion, probably this was only a prudent suspension of his final intentions, during the Popish reign of Queen Mary: for, on the accession of Elizabeth, he resumed the study of divinity; became a celebrated preacher, was made dean of Christ-church, and vice-chancellor of the university, having accumulated the degrees of bachelor and doctor in divinity. In 1569 he was made dean of Gloucester; and, the year following, bishop of Lincoln: whence, in 1584, he was translated to the see of Winchester; in which city he died on the 20th of April, 1594, and was buried in the cathedral there, on the fourth side of the choir. The several writers who have mentioned Dr. Cooper, unanimously give him the character of an eloquent preacher, a learned divine, and a good man. He had the misfortune, while at Oxford, to marry a lady whose gallantries became notorious: nevertheless he would not be divorced from her; knowing that he could not live without a wife, he did not choose "to charge his conscience with the scandal of a second marriage."—He wrote, 1. the Epitome of Chronicles from the 17th year after Christ, to 1540, and thence after to 1560. 2. the *Thesaurus lingue Romanæ et Britannicæ*. This dictionary, which is an improvement upon Elyot's, was much admired by Queen Elizabeth, who thenceforward determined to promote the author. 3. A brief exposition of such chapters of the Old Testament as usually are read in the church, at common prayer, on Sundays throughout the year. 4. An admonition to the people of England. 5. Sermons.

COOPER'S HILL, a fine hill in Surrey, celebrated by Sir John Denham's poem of the same name. Its base extends along the edge of the famous Runnymede; its summit is crowned by the beautiful spot called Englefield-green; and it lies 19 miles W. by S. of London, on the road from Egham, through Windsor Great Park, to Reading.

COOS, an island in the Archipelago, 66 N.W. of Rhodes, subject to the Turks. Long. 27. 44. E. Lat. 37. 1. N.

COPILOWATS, a large town of Turkey in Europe, in Bulgaria. Long. 36. 35. E. Lat. 46. 40. N.

COPORIA, a town of Ingria, in the Russian government of Petersburg, at the mouth of a river of the same name. Long. 29. 0. E. Lat. 59. 34. N.

COQUET, a river of Northumberland, which crosses the centre of that county, and enters the sea at Warkworth. Celebrated for its ancient castle and hermitage.

CORAH, or CORAHJEHEMABAD, a small city of Hindoostan Proper, in the Doab, or country between the Ganges and Jumna, subject to the Nabob of Oude. It is 60 miles S.S.W. of Lucknow. Long. 79. 45. E. Lat. 26. 5. N.

CORAM (Captain Thomas), a gentleman remarkably distinguished by his humanity, was born about the year 1668, and spent the early part of his life in the station of master of a vessel trading to our colonies. Afterwards residing in the eastern part of the metropolis, among seafaring people, where business often obliged him to come early in

the city and return late, he frequently saw young children exposed in the streets through the indigence or cruelty of their parents. This excited his compassion, and induced him to project the foundation of an hospital for foundlings. In this humane design he laboured with indefatigable diligence for seventeen years; and, by his application procured a number of the nobility and gentry to patronise and carry the scheme into execution, and at length obtained the royal charter for it. He was also highly instrumental in promoting the trade of America, by procuring a bounty upon naval stores imported from our colonies. He was likewise eminently concerned in settling on foot the colonies of Georgia and Nova Scotia. His last charitable design, in which he lived to make some progress, was a scheme for uniting the North-American Indians more closely to the British interest, by an establishment for the education of Indian girls. In short, he spent the greatest part of life in labouring for the public, and experienced a fate too common in those who devote their talents to such laudable purposes; being at last indebted for subsistence to the voluntary subscriptions of some public-spirited persons, at the head of whom was the late Frederick prince of Wales. Captain Coram died in 1751: and was interred, at his own desire, in a vault under the chapel of the Foundling Hospital.

CORBACH, a town of Germany, in the principality of Waldeck, ten miles N.W. of Waldeck. Long. 8. 58. E. Lat. 51. 20. N.

CORBECK, a town of the Austrian Netherlands, in Brabant, three miles S. of Louvain. Long. 4. 49. E. Lat. 50. 50. N.

CORBELL, a town of France, in the department of Seine and Oise and late province of the Ile of France, divided into two by the Seine, seventeen miles S. of Paris. Long. 2. 26. E. Lat. 48. 33. N.

CORBY, a town of Germany, on the confines of Westphalia, with a famous abbey, whose abbot is a sovereign prince. It is seated upon the river Weser. Long. 9. 30. E. Lat. 51. 50. N.

CORDOVA, a town of South America, in the province of Tucuman, with a bishop's see, 180 miles from St. Jago. Long. 62. 5. W. Lat. 32. 10. S.

CORDUS (Valerius), a learned botanist, was the son of Ericus Cordus, a physician and poet of Germany. Having learnt the languages, he applied himself to the study of botany: in the prosecution of which, he examined the mountains of Germany, and travelled into Italy; but, being wounded in the leg by a kick of a horse, died at Rome in 1544. He wrote Remarks on Dioscorides, and other works.

CORINNA, a Grecian lady, celebrated for her beauty and poetic talents, was born at Theffu, a city of Boeotia, and was the disciple of Myrtis, another Grecian lady. Her verses were so esteemed by the Greeks, that they gave her the name of the lyric muse. She lived in the time of Pindar, about 495 years before Christ; and is said to have gained the prize of lyric poetry from that poet: but Pausanias observes that her beauty made the judges partial.

CORITA, a town of Spain, in Leon, twenty-three miles E. of Salamanca. Long. 5. 49. W. Lat. 41. 5. N.

CORK (*Encycl.*). To our brief account of this city we add an extract from an account of a society established there for bettering the condition of the poor.

On the 22d of March, 1799, a meeting of some of the most respectable characters in Cork was held, for the purpose of forming a society, in that city, for bettering the condition of the poor. It was preceded by an address to the inhabitants of the city and neighbourhood of Cork, dated the 20th of February, referring to what has been done by the English

society, to the effects produced at Hamburgh, and to the unwearied and successful labours of Count Rumford at Munich; and observing (what may be very general in its application) that the charities at Cork, by the mode of relief they have held out, have rather tended to encourage idleness and beggary, and have increased, instead of diminishing, the number of distressed objects in that place. Feeling the difficulties of the attempt, yet confiding in the axiom, that though all may not be effected, yet no well-directed effort of benevolence can be entirely lost, the author, the Reverend Thomas Dix Hincks, proposed the formation "of a society, in imitation of that in London, but adapted to their own peculiar situation; hoping that by procuring, and, when approved of, recommending such plans as have been found successful in England, they may contribute to their adoption in that city and neighbourhood."

At the meeting, held on the 22d of March, it was resolved, that the society be immediately formed; and that the general object of it should be to collect information respecting the circumstances and situation of the poor in that city and neighbourhood, and the most effectual means of meliorating their condition; and to communicate this information to the public, in order than any comforts and advantages which the poor enjoy in other parts of the British empire, might be extended to that part in as great a degree as peculiar circumstances will admit. And as it had been found impossible, notwithstanding the large sums bestowed, to relieve all the distress that might occur in that large city, it appeared desirable that particular attention should be paid to all plans of economy, so as to extend the benefits of charitable institutions to as great a number as possible.

It was further resolved, that "the society do ever keep in view the principle, that the best relief the poor can receive, is that which comes from themselves; and that the most effectual method of improving their condition is by the encouragement of industry and prudence.—That the business of the society be transacted by a committee chosen annually.—That this committee be empowered to correspond with any other society, having a similar object; to purchase any books, which are calculated to give them information on the subject; and to print any plan which they think deserving of the public attention.—That the committee be also empowered to offer such rewards for good conduct, as the state of the funds will admit, so as to awaken the attention of the poor, to what will promote their best interests.—That the committee consist of a president, five vice-presidents, and twenty-six members, including the treasurer and secretary, to be chosen at an annual meeting of the subscribers.—That no plan be printed, or any expence incurred, without the approbation of at least five members of the committee assembled in a regular manner.—That the committee meet once each month for the transaction of business.—That a sub-committee, chosen out of the general committee, and consisting of seven members of the general committee, do meet once a-week (that week excepted in which the general committee assemble), for the purpose of examining reports, and preparing plans for the inspection of the general committee.—That every subscriber be entitled to attend the meetings of the general or sub-committee, and to give his opinion, but not to have a vote on the decision of any question.—And that every member subscribe half a guinea annually, to defray the expences of the society."

The number of members already exceeds 120, and includes the most respectable inhabitants of the city of Cork. The Lord-bishop of Cork is the president. The vice-presidents are, Dr. Moylan (the titular bishop of Cork), the Honourable Dean St. Lawrence, Sir Samuel Rowland, Mr. Sergeant Chatterton, and Mr. Anderson.

One of their first objects is to encourage the establishment

of friendly societies, upon a general plan, which may require very few, if any, meetings of the subscribers. For this purpose the increase of honorary members, and the holding out every possible advantage to the other members, have appeared to be necessary.

It is essential to the permanent peace and welfare of Ireland, to introduce among the poor in that kingdom a proper and useful system of education,—habits of cleanliness,—a taste for the comforts of life, as applied, to food, habitation, and clothes;—and to promote the reciprocity of kindness and mutual good-will among the different classes of life; so as to give the mass of the people more interest in the established order of society, and more incitement to industry and exertion, and to connect them by a closer and more secure bond with the welfare and happiness of Ireland.

This can only be effected by the co-operation of the other ranks of society in that kingdom: and such a co-operation would be very greatly promoted by the formation of institutions like that which reflects so much honour on the patriotism and public spirit of the city of Cork.

It must give infinite satisfaction to see a Protestant and a Roman-catholic bishop uniting in a friendly and benevolent co-operation, for the religious and moral improvement, and for the temporal welfare and comfort, of their united flocks. If this example be followed throughout Ireland, it may produce the best effects, not only in meliorating the character and condition of the poor, but in removing religious prejudices, and in promoting Christian charity, between the Catholics and Protestants in that country.

Another institution well worthy of an account in this place is that of a friendly society, formed in 1799, by the assistance of the Cork society for bettering the condition of the poor.

The objects of this friendly society are confined to a providory fund for the support of the subscribing members in sickness, and old age, and for their decent interment. Circumstances have prevented the extension of it to widows and children. Persons however of all ranks and descriptions, and of both sexes, residing within the limits of the city of Cork, above the age of fifteen and under that of fifty, are admissible into this society.

The subscriptions are to be paid upon admission, and during life to be continued monthly, by each member, as follows:

Under thirty years of age,	1s. 1d.
Above thirty, and under forty,	1 4
Above forty, and under fifty,	1 9

Persons who by their age would come within one of the two last classes, are admissible into that immediately below it, on payment of one guinea and a half upon admission.

The funds of the society are open to augmentation by the contributions of the benevolent, and by prescribed forfeits in the members; viz. for neglect in payment of their monthly subscription, three pence for the first, and six-pence halfpenny for the second omission—for soliciting charity, two shillings and eight-pence halfpenny—and for intoxication, whilst receiving relief from the society, three shillings and three pence.

As the funds of the society are in the nature of shares, every member during sickness is entitled to relief for each share, and proportionably for half a share, which he or she shall have in the fund by a weekly allowance; and members above sixty, preferring an annuity to weekly payments, in sickness or infirmity, are entitled to progressive annuities during their natural lives, according to their ages. At sixty years of age, to an annuity of five pounds;—at seventy years of age, of seven pounds ten shillings;—at eighty years, of ten pounds; and at the age of ninety years or upwards, to an annuity of twelve pounds a-year for life. In case of death, each member is entitled to a specific sum for the expence of his or her funeral.

The regulations of the society state exceptions to relief, and authorise exclusion from the society. In the first case, among other specified instances, no member shall be entitled to relief for any disease, distemper, or infirmity, which he or she may have had, when admitted a member; nor for any distemper contracted by lewdness; nor for any lameness, misfortune, or accident, occasioned by quarrelling, rioting, drunkenness, or gaming; nor if imprisoned on a charge of treason, or felony, until legally acquitted of the same.

The penalty of exclusion is inflicted on members who shall attempt to take any advantage, by dissembing any sickness or infirmity, or by using any kind of fraud towards the society; or who shall neglect to pay his or her monthly payments for three successive months, or, in case of default, the prescribed forfeits; or who shall be a notorious drunkard or gambler; or who shall be criminally convicted. In any of which cases the person is to forfeit his or her title or claim to any part of the funds of the society.

Every person wishing to become a member of this society, must produce a certificate of his or her character, according to a prescribed rule: and every person admitted a member must, at the time of admission, subscribe an obligation, containing a promise and declaration, in all things well and truly to fulfil, keep, and observe, the rules, orders, and regulations of the society, and to promote its interest to the utmost of his power.

The funds of the society are vested in trustees, consisting of the president, vice-presidents, and committee, for the time being, of the society established in the city of Cork, "for bettering the condition and increasing the comforts of the poor." The direction of the society is vested in twenty-one persons, to be appointed annually by the trustees, from among the subscribing members of the "society for bettering the condition of the poor," or from among any other public institution for the benefit of the poor, who, together with the treasurer and honorary members of this friendly society, are constituted the directors thereof.

The rules and regulations for the government of this society are calculated effectually to guard against the inconveniences to which associations of this nature are sometimes liable. There are no meetings of the existing members; nor can the dissolution of the society, or any distribution of its funds, fraudulent in itself, and contrary to the true meaning of the regulations, take place, but under such restrictions as exclude the possibility of any derangement of the society, or the misapplication of its funds. The regulations are equally calculated to provide for the health, and to secure and improve the morals and good conduct, of the members of the society. A certificate of character is a prescribed title for admission. The regular payment of the monthly contributions is enforced by forfeits; whilst the penalty of exclusion applies equally to prevent successive failures in payment, and to check immoral conduct. In the respectability of the gentlemen who have voluntarily undertaken the office of trustees and directors, the members of this friendly society have a solid security, that their interests will be well managed, and the laws of the association duly enforced for the benefit of all the members.

We have given a place to these accounts in the hope of being the instruments of similar good in other parts of a country where such associations are greatly wanted.

CORMENTIN, a fortress on the Gold Coast of Guinea, belonging to the Dutch. Below it is the town, which is large and populous. Long. o. 15. W. Lat. 5. 30. N.

CORMERY, a town of France, in the department of Indre and Loire and late province of Touraine. It had recently a rich Benedictine abbey, and is seated on the Indre, eight miles from Tours. Long. o. 28. E. Lat. 47. 30. N.

CORN (*Encycl.*). There are several species of corn, such as wheat, rye and barley, millet and rice, oats, maize and lentils, peas, and a number of other kinds, each of which has its usefulness. But of these scarcely any possess such highly nutritive qualities as **MATZG** or **Indian CORN**. See the article **ZEA**.

Count Rumford, in his fifth essay, published in 1796, took considerable pains to draw the attention of the public to this very important article of diet. Indian corn is produced in abundance and of the best quality in British America. It is capable of being ground into meal like any other grain, and in this state admits of various kinds of culinary preparation. One simple and obvious way of using it is, to mix it with wheat, rye, or barley, in making bread; in which case the proportion of one-half may be employed. It makes an excellent and cheap family pudding, when mixed with molasses and a little salt*, and boiled in a bag; and may be enriched and accommodated to different tastes by the intermixture of sliced apples or small fruits. If a good quantity is made at once, it may be very conveniently cut in slices and fried; these Indian puddings not being the worse for several days' keeping.

Whether the making and vending this kind of pudding in its plain state to the poor, along with meat soup, would be a means of rendering bread unnecessary, or whether thickening the soup with Indian meal might be made to answer the same salutary purpose with less trouble, are subjects worthy of consideration with those who superintend the public kitchens. As the Indian meal requires long boiling to free it from its raw taste, the latter mode appears, in fact, to promise the greater advantages; though it is likely the poor themselves would prefer "solid pudding," even at an additional charge, to a diet approaching so much to the fluid state.

But the most economical way of preparing Indian meal appeared to be the stirring it into a quantity of water, so as to make hasty-pudding, in which state it is eaten and universally approved in America, where its nutritious qualities are reckoned superior even to those of wheat. The manner in which this is done is the following:

A quantity of water, with an adequate proportion of salt diffused in it, being put on the fire, repeated handfuls of Indian meal are gradually stirred into it, so as to make an uniform mixture. As the contents of the pot approach to a boiling state they become thicker and thicker, and at last, by a due regulation of the proportion of meal, and constant stirring, the pudding becomes sufficiently solid to keep the implement with which it is stirred, upright, when plunged into the middle of the kettle. Half an hour's further boiling finishes the process.

This pudding, however, is scarcely favourable enough to make a meal without some kind of sauce; and this perhaps may make it a less eligible mode of first introducing Indian corn to the notice of the poor as an article of diet. Count Rumford, indeed, who made the experiment, shews, by the following statement, that, with even this disadvantage, a comfortable meal may be made at the trifling expence of five farthings.

1 lb. 1 $\frac{1}{2}$ oz. of pudding	Farthings
Sauce, consisting of butter, molasses, and vinegar	2 $\frac{1}{2}$
	2 $\frac{3}{4}$

In Italy, where this kind of pudding is in great popular esteem, it is very commonly eaten without any sauce, under the name of *polecia*: surely the poor of this country, by gradual steps, and especially by the example of their superiors (which, by the way, is very material), may be led to avail

themselves of so great a benefit, and be taught to relish, in a country liable to occasional deficiencies in the produce of grain, as well as to considerable temporary changes in the price of other necessaries of life, some of those kinds of food which are known to be highly acceptable to the inhabitants of distant climates.

CORN-GRINDING Machine, an invention for which a patent has been granted to Mr. Barratt, of Gedling, in the county of Nottingham. In the specification it is said to be a more simple, concise, and cheap method of grinding corn, or other grain, than has been hitherto used. It is either moveable or immovable, and intended to be worked by water, wind, horses, hand, or otherwise.

"This mill," says the inventor, "may be conveniently erected in a garden or croft, wherever the wind has access, and is so light as to be capable of being turned by the hand, or the sails may occasionally be affixed in a horizontal position to the upright shaft; and on taking down the shed over the mouth-hopper, the power of a horse may be applied when the wind fails. It will perhaps be necessary, on this occasion, to have the wheel A, Plate 22. fig. 1. enlarged, which may be readily effected by screwing on an additional wheel in quadrants or octants, as may be preferred. The whole apparatus may be conveniently fixed on a centre, with a gudgeon at each end, to the gable end of a house, barn, or granary, a peculiar provision being planned in the sails for that purpose. It will appear obvious, that its internal construction is suited to any power which may be substituted for the sails; and it will be superfluous to hint to a workman, how hand-mills may be connected with the crown and spur-wheels at the same time to grind malt, split beans, cut hay, straw, &c.

"Fig. 1. A is a crown and spur wheel; it has three concentric circles, 1, 2, 3, with teeth adapted to the spur-wheel above, on the mill-shaft, the teeth in the second being higher than the first, and in the third higher than the second, to meet the elevation of the mill-shaft above the plane of the crown-wheel. These circles are called the speed-wheels, serving to increase the velocity of the stones, or to preserve it when the velocity of the wind decreases. This wheel may be dispensed with, with one or two pair of stones, the nut on the spindle being made contrate instead of spur, and immediately connected with the spur-wheel, affixed to the axis of the mill by means of a sliding box A (fig. 2.), and screwed in its position by the screw S (fig. 2.), by which it is adapted to each of the concentric circles, as the crown-wheel is required to move faster or slower. C is the brake-wheel, which retards or stops the motion of the sails by its friction with the wedge W. (See for its position on the axis fig. 2.) D is a circular plate of cast-iron, belonging to, and being part of, the iron axis of the mill-shaft, or the upright axis of the crown-wheel. Upon this plate, on the continuation of the spindle (see d, fig. 2.), is placed the cross fig. 4. to which it is fastened by four screws passing through the four holes of both; and the extremity of the arm of each fall into which the said cross is inserted at the slot f (fig. 3.), and secured by another screw and moveable iron bandages. E is the gallows, which supports the gudgeon of the mill-shaft, which, moving on a centre at the small end, permits the spur-wheel to be thrown in or out of gear by means of the wedge at the other end. The stones moved by the nut s are placed in a box in the frame G, fixed on a platform m, which, sliding on the rails n, n, the spindle is thrown out of gear by the screw H passing through the iron rod,

* Three pounds of Indian meal stirred into five pints of boiling water, with the addition of one ounce of salt and three fourths of a pound of molasses, the whole tied loosely in a bag and boiled six hours, makes ten pounds of pudding at an expence of less than 1d. per pound. See Count Rumford's 3d essay, p. 264.

which, by the screw I, raises or depresses the bridge-tree, *a* is an iron axis, with small wheels at each end, for turning a lifting machine.

"Fig. 3. is the sail-arm, into which, at the mortise *a*, is put the supporting arm D, at its end *b*, and secured by a peg: the fixed part of the sail E falls into the slot C, and is kept in its position by the guards *d*, and a peg in the groove B. The two other fan-fails F, F, slide on each side of the fixed one, moving on a centre at the narrow extremity, and, when expanded to the wind, are kept in their positions by pegs in the same groove catching in the notches at the other extremity: these fails are made of thin boards. When the fails are affixed to a gable-end, whence it will occasionally be necessary to catch the wind on opposite sides of the sail, the ledge *c* is attached to each fail-arm into the nicks, on which falls the spring *m* of the adjoining fail, by which means the fails are turned to opposite degrees of obliquity. The frame of the machinery, as depicted in the specification, turns on castors, on a circular base."

The patentee has erected a mill, of the above description, at his house at Gedling, near Nottingham, and has various models, open for the inspection of such persons as may wish to see them. These mills may be adapted to be worked either by rivulets or the wind: in the latter case they may be erected on the stem of a standing tree, or the gable end or corner of a house, barn, or other building, in any of which situations the whole apparatus for grinding, &c. may be contained within the attic or other room.

The price of the above mills, adapted to gable ends, to work only one pair of grey stones, of not more than thirty inches diameter, is thirty-five guineas; if with a preparation for other machinery three guineas more. Those to be erected on the ground, adapted either for wind or water, will be from forty-five to sixty guineas; and if two pair of stones, dimensions as above, from fifteen to twenty guineas extra; if of larger sizes, the price will advance in proportion.

The mills on the ground may be made either portable or immovable, on posts, and when boarded forms a complete house, under the works, for the miller, and a receptacle for his flour.

These mills, according to the size of the stones, will turn off as much work as any mills on the old construction. The prices mentioned are exclusive of any water-works, carriage, or fixing.

CORNARIUS, or **HAGUENBOT** (John), a celebrated German physician, born at Zwickow in Saxony. His preceptor, made him change his name of Hagenbot to that of Cornarius, under which he is most known. At twenty years of age he taught grammar, and explained the Greek and Latin poets and orators to his scholars; and at twenty-three, was licentiate in medicine. He found fault with most of the remedies provided by the apothecaries; and observing, that the greatest part of the physicians taught their pupils only what is to be found in Avicenna, Rhazes, and the other Arabian physicians, he carefully sought for the writings of the best physicians of Greece, and employed about fifteen years in translating them into Latin, especially the works of Hippocrates, Aëtius, Æginetus, and a part of those of Galen. Meanwhile he practised physic with reputation at Zwickow, Frankfurt, Marburg, Nordhausen, and Gena, where he died of an apoplexy in 1558, aged fifty-eight. He also wrote some medicinal treatises; published editions of some poems of the ancients on medicine and botany; and translated some of the works of the fathers, particularly those of Basil, and a part of those of Epiphanius.

CORNET, a castle on the island of Guernsey. Long. 2. 40. W. Lat. 49. 30. N.

CORNETO, a town of Italy, in the patrimony of St. Peter, with a bishop's see, seated on the river Marta, three miles E. of the sea, and thirty-seven N.W. of Rome. Long. 11. 53. E. Lat. 42. 15. N.

CORNUS (Encycl.). The second species, namely, the *cornus sanguinea*, bloody-twig, or common dog-wood, hath been found capable of yielding an oil applicable to some useful purposes. The following account is taken from the *Annales de Chimie*.

"The *cornus sanguinea* of Linneus," says Citizen Marqueron, of Strasburg, who writes that article, "is a shrub so much esteemed by ornamental gardeners, for embellishing clumps of trees, both on account of its beautiful form, and the fine red colour which its branches and leaves assume towards the close of the summer, bears a berry, which, when ripe, is of a blackish colour, whose utility, both for the purposes of medicine and the arts, has never hitherto been properly estimated."

"The greasy unctuous appearance which these berries exhibit when crushed between the fingers, led me to imagine that they might contain an oil, which certainly must possess some useful properties. Well persuaded of this truth, that none of nature's productions are without their use, I prevailed upon Citizen Chevreul, botanical gardener at Molsheim, in the department of the Lower Rhine, where this shrub grows in great abundance, to collect a quantity of its berries."

"Ten kilogrammes of these berries were collected and spread out in a garret, not for the purpose of drying them, but in order that they might acquire a softer consistence: in this state they were reduced to a paste, and subjected to the press, where, without the application of heat, two litres were obtained, of a greasy unctuous liquid, possessing a degree of viscosity similar to that of oil, of a green, though very pellucid, colour; it was perfectly homogeneous, and exhibited all the physical properties of a real oil, without possessing either a disagreeable smell or taste, which determined Citizen Chevreul and me to eat a salad prepared with it, which we did several times without experiencing any bad effects from it. These properties, however, not being sufficient to demonstrate that this liquid was really an oil, I undertook the task of subjecting it to various experiments, of which the result is as follows:

"A drop of this oily liquid, when let fall into a vessel filled with water, extended itself over its surface in a very fine pellicle, which reflected the prismatic colours."

"Wishing to know whether it were possible to deprive this oily substance of its green colour, I washed it with cold and hot water, the water being charged with sulphate of alumine, powdered slate, charcoal-powder, &c. All these different means were of no effect, the liquids above mentioned did not receive any new tinge, and the green colour of the oil remained always the same."

"Alcohol was also employed. This menstruum having assumed a greenish tinge, I imagined that I should be able thereby to extract the colouring matter of the oily liquid; for which purpose I added a portion of this alcohol, tinged as above mentioned, to a certain quantity of water. The mixture immediately became white, and some drops of oil swam at the top. I evaporated, in a distilling apparatus, another portion of this coloured alcohol: the alcohol which I thus obtained was colourless, and there remained behind a quantity of oil, of the same colour as before: the alcohol therefore owed its colour only to the solution of a portion of the oil, and not to the separation of the colouring principle."

"Sulphur combined completely with this oil: with the aid of caloric, there resulted from this combination a real balfam of sulphur, of a fine deep red colour, verging upon the brown and of an extremely feid smell."

"Potash, soda, and ammowia, formed with this oil real soaps, possessing different degrees of solidity.

"The concentrated sulphuric acid, combined with this oil, produced a real acid soap, of a yellowish colour, and the appearance of a resin.

"The nitric and muriatic acids exhibited no perceptible operation upon the oil, when applied to it in the cold way, excepting that they assumed a slight greenish tinge.

"Nitric acid, when heated with this oil, caused it to assume a solid consistence, and a yellow colour, perfectly resembling that of yellow pomatum; during the ebullition there took place a considerable swelling in the mass, an extrication of nitrous gas, &c. The theory of this operation being perfectly well known, it will be unnecessary to explain it in this place.

"Not having been able to procure nitrous acid, it was impracticable for me to ascertain the inflammability of this oil by the acids.

"By boiling for some time upon litharge, this oil acquired the ficative property, which rendered it fit for being employed in painting, a property which it possessed before its oxygenation, but in a less degree than afterwards.

"By continuing the ebullition, the oxyde of lead was disoxydated, and entirely dissolved; and the mixture acquired a consistence and brown colour, perfectly resembling that of the brown diachylon (*onguent de la mère*).

"I repeated the same experiment, taking care to add water, and constantly stir the liquid, in the manner which is practised in preparing the *diapalma* plaster; by which means I obtained a substance of a good consistence, and a colour perfectly resembling that of the *Empl. de vigo cum mercurio*: this colour having made me believe that I had failed to obtain a plaster, which I imagined ought to be of a whitish colour, I repeated the experiment several times with all possible attention; and every time I obtained a plaster of the same colour. The theory of plasters having been very well explained by Citizen Deyeux, it may be dispensed with in this place. I exposed a quantity of this oil to the contact of the atmospheric air: after some time it was found to have acquired a somewhat greater degree of consistence.

"The same experiment was repeated, but with the addition of water, and the observance of all the precautions directed by Citizen Berthollet: at the end of a month the oil had acquired a solid consistence, and a white colour, similar to that of wax.

"Wishing, finally, to know of what utility this oil might be for domestic purposes, I poured it into a lamp with cotton wicks, which being lighted threw out a bright light, without any perceptible smoke or smell: the same lamp, with wicks of the same kind, was successively filled with oil of olives and rape seed oil: the latter burnt two hours, the olive-oil two hours and a quarter, and the oil of the *cornus sanguinea* two hours and a half.

"If we add to these facts, the property of congealing, which belongs to this oil, we shall have all the characters of the oil of the *cornus sanguinea*.

"From these experiments, which are all that I have had it in my power to make, I am authorised to conclude, that the oily juice obtained by expression from the *cornus sanguinea* is a real oil, possessing certain properties that may render it useful in the arts, commerce, and perhaps in medicine. I also think that it ought to be placed, according to Fourcroy's principles, in the second class, which comprehends the ficative oils, which speedily grow thick, are not congealed by the action of the cold, take fire with nitrous acid alone, and form with sulphuric acid resinous compositions.

CORO, a town of South America, in Terra Firma, seated at the bottom of the gulf of Venezuela, 50 miles W. of La Guaira. Long. 70. 0. W. Lat. 11. 0. N.

Voz. X.

COROMANDEL (*Encycl.*). This eastern coast of the peninsula on this side the Ganges, is bounded on the north by Golconda, on the east by the bay of Bengal, on the south by Madura, and on the west by Bimnagar. This coast so much resembles that of Orixá, that the Abbé Raynal chooses to consider them as one, and gives to both the general name of *Coromandel*. Here an excessive heat reigns from the beginning of May to the end of October. It begins at nine in the morning, and continues till nine in the evening. During the night it is allayed by a sea-breeze from the south-east; and most commonly this refreshing gale begins at three in the afternoon. The air is less inflamed during the rest of the year, though in all seasons it is very hot. It rains almost continually during the months of November and December. This immense tract is covered with a parched sand for the extent of two miles, and sometimes only one mile along the coast.

This country was at first neglected by the Europeans for many reasons. It was separated by inaccessible mountains from Malabar, where these bold adventurers endeavoured to settle themselves. Spices and aromatics, which were the principal objects of their attention, were not to be found there. In short, civil dissensions had banished from it tranquillity, security, and industry. At that period the empire of Bimnagar, to which this vast country was subject, was falling to ruin. The governments of Visapour, the Carnatic, Golconda, and Orixá, threw off their dependence, and assumed the title of kings. Those of Madura, Tanjore, Mysore, Gingi, and some others, likewise usurped the sovereign authority, though they retained their ancient title of *Naiak*. This revolution had just happened when the Europeans appeared on the coast of Coromandel. The foreign trade was at that time inconsiderable; it consisted only of diamonds from Golconda, which were carried to Calicut and Surat, and from thence to Ormus or Suez, whence they were circulated through all Europe and Asia. Masulipatan, the richest and most populous city of these countries, was the only market that was known for linens; they were purchased at a great fair annually holden there by the Arabian and Malayan vessels that frequented that bay, and by caravans arrived from distant parts. The linens were exported to the same places with the diamonds. The fondness for the manufactures of Coromandel which began to prevail here, inspired all the European nations trading to the Indian seas with the resolution of forming settlements there. They were not discouraged either by the difficulty of conveying goods from the inland parts of the country, where there was no navigable river; by the total want of harbours, where the sea, at one season of the year, is not navigable; by the barrenness of the coasts, for the most part uncultivated and uninhabited; or by the tyranny and fluctuating state of the government. They thought that silver would be industriously fought after; that Pegu would furnish timber for building, and Bengal, corn for subsistence; that a prosperous voyage of nine months would be more than sufficient to complete their ladings; and that by fortifying themselves they should be secure against the attacks of the weak tyrants that oppressed these countries.

The first European colonies were established near the shore. Some of them obtained a settlement by force: most of them were formed with the consent of the sovereigns; and all were confined to a very narrow tract of land. The boundaries of each were marked out by a hedge of thorny plants, which was their only defence. In process of time fortifications were raised; and the security derived from them, added to the lenity of the government, soon increased the number of colonists. The splendor and independence of these settlements several times raised the jealousy of the princes in whose dominions they were formed; but their attempts to demolish

them proved abortive. Each colony increased in prosperity in proportion to the riches and the wisdom of the nation that founded it. None of the companies that exercised an exclusive privilege beyond the Cape of Good Hope had any concern in the trade of diamonds. This was always left to private merchants, and by degrees fell entirely into the hands of the English, or the Jews and Armenians that lived under their protection. At present this grand object of luxury and industry is much reduced. The revolutions that have happened in India have prevented people from resorting to these rich mines; and the anarchy in which this unhappy country is plunged, leaves no room to hope that they will be again attended to. The whole of the commercial operations on the coast of Coromandel is confined to the purchase of cottons. The manufacturing of the white cottons bought there, differs so little from ours, that it would be neither interesting nor instructive to enter into a minute description of it. The process used in making their printed cottons, which was at first servilely followed in Europe, has since been rendered more simple, and brought to greater perfection by our manufacturers. The painted cottons which are bought there, we have not yet attempted to imitate. Those who imagine we have been prevented from undertaking this branch merely by the high price of labour among us, are mistaken. Nature has not given us the wild fruits and drugs necessary for the composition of those bright and indelible colours which constitute the principal merit of the Indian manufactures; nor has she furnished us with the waters that serve to fix them. The Indians do not universally observe the same method in painting their cottons; either because there are some niceties peculiar to certain provinces, or because different soils produce different drugs for the same uses. We should tire the patience of our readers were we to trace the slow and painful progress of the Indians in the art of painting their cottons. It is natural to believe that they owe it to length of time, rather than to the fertility of their genius. What seems to authorize this conjecture is, that they have stopped in their improvements, and have not advanced a single step in the arts for many ages; whereas we have proceeded with amazing rapidity. Indeed, were we to consider only the want of invention in the Indians, we should be tempted to believe, that, from time immemorial, they have received the arts they cultivate from some more industrious nation; but when it is remembered that these arts have a peculiar dependence on the materials, gums, colours, and productions of India, we cannot but be convinced that they are natives of that country. It may appear somewhat surprising that cottons painted with all sorts of colours should be sold at so moderate a price, that they are almost as cheap as those that have only two or three. But it must be observed, that the merchants of the country sell to all the companies a large quantity of cottons at a time; and that the demand for cottons painted with various colours makes but a small article in their assortments, as they are not much esteemed in Europe.

Though cottons of all sorts are in some degree manufactured throughout the whole country of India, which extends from Cape Cormorin to the banks of the Ganges; it is observable, that the fine sorts are made in the eastern parts, the common ones in the centre, and the coarse ones in the most western parts. Manufactures are established in the European colonies, and upon the coast: they are more frequent at the distance of five or six leagues from the sea, where cotton is more cultivated, and provisions are cheaper. The purchases made there are carried 30 or 40 leagues further into the country. The Indian merchants settled in the European factories have always the management of this business. The quantity and quality of the goods wanted are settled with these people: the price is fixed according to the patterns:

and, at the time the contract is made, a third or a fourth part of the money agreed on is advanced. This arrangement is owing to the necessity these merchants themselves are under of advancing money to the workmen, by the partners or agents who are dispersed through the whole country; of keeping a watchful eye upon them, for fear of losing what they have advanced; and of gradually lessening the sum, by calling for the cottons as fast as they are worked off. Without these precautions, nothing could be depended on in an oppressive government, where the weaver cannot work on his own account, either because his circumstances will not permit, or because he dares not venture to discover them for fear of exactions. The companies that have either success, or good management, constantly keep the stock of one year in advance in their settlements. By this method they are sure of having the quantity of goods they have occasion for, and of the quality they choose, at the most convenient time: not to mention that their workmen and their merchants, who are kept in constant employment, never leave them. Such nations as want money and credit cannot begin their mercantile operations till the arrival of their ships. They have only five or six months at most to execute the orders sent from Europe. The goods are manufactured and examined in haste; and they are even obliged to take such as are known to be bad, and would be rejected at any other time. The necessity they are under of completing their cargoes, and fitting out their vessels before hurricanes come on, leaves no room for nicety of inspection. It would be a mistake to imagine that the country agents could be prevailed upon to order goods to be made on their account, in hopes of selling them without a reasonable advantage to the company with whom they are engaged. For, besides that the generality of them are not rich enough to embark in so large an undertaking, they would not be certain of finding their account in it. If the company that employ them should be hindered by unforeseen accidents from sending the usual number of ships, these merchants would have no vent for their commodities. The Indians, the form of whose dresses requires different breadths and lengths from those of the cottons fabricated for our use, would not purchase them; and the other European companies would be provided, or certain of being provided, with whatever the extent of their trade required, and their money enabled them to purchase. The plan of procuring loans, which was contrived to remedy this inconvenience, never has, nor can be useful. It has been a custom, time immemorial, in India, for every citizen who borrows money, to give a written instrument to his creditor. This deed is of no force in a court of judicature, unless it is signed by three witnesses, and bears the day of the month, and the year when it was made, with the rate of interest agreed upon by the parties. If the borrower fails to fulfil his engagements, he may be arrested by the lender himself. He is never imprisoned, because there is no fear of his making his escape. He would not even eat, without obtaining leave of his creditor. The Indians make a three-fold division of interest: one kind they call *vice*; another neither *vice* nor *virtue*; and a third, they say, is *virtue*. The first is four per cent. a month; the second two; and the third one. The last is, in their opinion, an act of beneficence that only belongs to the most heroic minds. Yet, though the Europeans, who are forced to borrow, meet with this treatment, it is plain they cannot avail themselves of the indulgence without being involved in ruin.

The foreign trade of Coromandel is not in the hands of the natives. In the western part, indeed, there are Mahomedans known by the name of *Chalias*, who, at Naur, and Porto-Novo, send out ships to Acken, Merguy, Siam, and the Eastern coast. Besides vessels of considerable burthen employed in these voyages, they have smaller embarkations for the coasting trade for Ceylon, and the pearl fishery. The Indians of

Mañilapatán turn their attention another way. They import from Bengal white calicoes, which they dye or print, and sell them again at the places from whence they had them, at 33 or 40 per cent. advantage. Excepting these transactions, which are of very little consequence, the whole trade is vested in the Europeans, who have no partners but a few Banians and Armenians settled in their colonies. The quantity of calicoes exported from Coromandel to the different parts of India, may be computed at 3500 bales. Of these the French carry 800 to Malabar, Mocha, and the Isle of France; the English, 1200 to Bombay, Malabar, Sumatra, and the Philippine Islands; and the Dutch 1500 to their different settlements. Except 500 bales destined for Manila, each of the value of 100 guineas, the others are of such an ordinary kind that they do not exceed 30 guineas at prime cost; so that the whole number of bales do not amount to more than about 150,000.

Coromandel furnishes Europe with 9500 bales; 800 of which are bought by the Danes, 2500 by the French, 3000 by the English, and 3200 by the Dutch. A considerable part of these calicoes are dyed blue, or striped blue and red for the African trade. The others are fine muslins, printed calicoes, and handkerchiefs from Mañilapatán, or Palacate. It is proved by experience that each of these bales costs only about 42l. sterling; consequently they ought to bring in to the manufactory where they are wrought, near 360,000l. The payments are not entirely made in specie, either in Europe or Asia; we give in exchange, cloths, iron, lead, copper, coral, and some other articles of less value. On the other hand, Asia pays with spices, pepper, rice, sugar, corn, and dates. All these articles taken together may amount to about 210,000l.; and from this calculation it follows, that Coromandel receives annually from Europe about 300,000l. in money. The British, who have acquired the same superiority on this coast that they have elsewhere, have formed on it several settlements.

CORON, a sea-port of Turkey in Europe, in the Moræa. It is seated on a bay, 15 miles S.E. of Modon. Long. 21. 30. E. Lat. 36. 50. N.

CORPORATION (*Encycl.*). Having in that article noticed the several species of corporations, we here purpose to consider, 1. How corporations in general may be created, 2. What are their powers, capacities, and incapacities. And, 3. How they may be dissolved. We shall in this follow Judge Blackstone.

I. Corporations, by the civil law, seem to have been created by the mere act, and voluntary association, of their members; provided such convention was not contrary to law, for then it was *illicitum collegium*. It does not appear that the prince's consent was necessary to be actually given to the foundation of them; but merely that the original founders of these voluntary and friendly societies (for they were little more than such) should not establish any meetings in opposition to the laws of the state.

But in England the king's consent is absolutely necessary to the erection of any corporation, either implied or expressly given*. The king's implied consent is to be found in corporations which exist by force of the common law, to which our former kings are supposed to have given their concurrence; common law being nothing else but custom, arising from the universal agreement of the whole community. Of this sort are the king himself, all bishops, parsons, vicars, churchwardens, and some others; who, by common law, have

ever been held (as far as our books can shew us) to have been corporations, *virtute officii*; and this incorporation is so inseparably annexed to their offices, that we cannot frame a complete legal idea of any of these persons, but we must also have an idea of a corporation, capable to transmit his rights to his successors, at the same time. Another method of implication, whereby the king's consent is presumed, is as to all corporations by prescription, such as the city of London, and many others, which have existed as corporations, time whereof the memory of man runneth not to the contrary; and therefore are looked upon in law to be well created. For though the members thereof can shew no legal charter of incorporation, yet, in cases of such high antiquity the law presumes there once was one; and that by the variety of accidents which a length of time may produce, the charter is lost or destroyed. The methods by which the king's consent is expressly given, are either by act of parliament or charter. By act of parliament, of which the royal assent is a necessary ingredient, corporations may undoubtedly be created: but it is observable, that most of those statutes which are usually cited as having created corporations, do either confirm such as have been before created by the king; as in the case of the college of physicians, erected by charter to Hen. VIII. which charter was afterwards confirmed in parliament; or, they permit the king to erect a corporation *in futuro* with such and such powers; as is the case of the bank of England, and the society of the British fishery. So that the immediate creative act is usually performed by the king alone, in virtue of his royal prerogative.

All the other methods therefore whereby corporations exist, by common law, by prescription, and by act of parliament, are for the most part reducible to this of the king's letters patent, or charter of incorporation. The king's creation may be performed by the words "*creamus, erigimus, fundamus, incorporamus*," or the like. Nay it is held, that if the king grants to a set of men to have *gildam mercatoriam*, "a mercantile meeting or assembly," this is alone sufficient to incorporate and establish them for ever.

The king (it is said) may grant to a subject the power of erecting corporations, though the contrary was formerly held: that is, he may permit the subject to name the persons and powers of the corporation at his pleasure; but it is really the king that erects, and the subject is but the instrument: for though none but the king can make a corporation, yet *qui facit per alium, facit per se*. In this manner the chancellor of the university of Oxford has power by charter to erect corporations; and has actually often exerted it in the erection of several matriculated companies, now subsisting, of tradesmen subservient to the students.

When a corporation is erected, a name must be given to it; and by that name alone it must live, and be sued, and do all legal acts.

II. After a corporation is so formed and named, it acquires many powers and rights, which we are next to consider. Some of these are necessarily and inseparably incident to every corporation; which incidents, as soon as a corporation is duly erected, are tacitly annexed of course. As, 1. To have perpetual succession. This is the very end of its incorporation: for there cannot be a succession for ever without an incorporation; and therefore all aggregate corporations have a power necessarily implied of electing members in the room of such as go off. 2. To sue, or be sued, implead, or be impleaded, grant or receive, by its corporate name, and do all other

* Cities and towns were first erected into corporate communities on the Continent, and endowed with many valuable privileges, about the 11th century (Robert. Cha. V. i. 30); to which the consent of the feudal sovereign was absolutely necessary, as many of his prerogatives and revenues were thereby considerably diminished.

acts as natural persons may. 3. To purchase lands, and hold them, for the benefit of themselves and their successors: which two are consequential to the former. 4. To have a common seal. For a corporation, being an invisible body, cannot manifest its intentions by any personal act or oral discourse: it therefore acts and speaks only by its common seal. For, though the particular members may express their private consents to any act, by words, or signing their names, yet this does not bind the corporation: it is the fixing of the seal, and that only, which unites the several assents of the individuals, who compose the community, and makes one joint assent of the whole. 5. To make by-laws or private statutes for the better government of the corporation; which are binding upon themselves, unless contrary to the laws of the land, and then they are void. But no trading company is with us allowed to make by-laws, which may affect the king's prerogative, or the common profit of the people, under penalty of 40*l.* unless they be approved by the chancellor, treasurer, and chief justices, or the judges of assize in their circuits: and, even though they be so approved, still, if contrary to law, they are void. These five powers are inseparably incident to every corporation, at least to every corporation aggregate: for two of them, though they may be practised, yet are very unnecessary to a corporation *sole*: viz. to have a corporate seal to testify his sole assent, and to make statutes for the regulation of his own conduct.

Corporations have a capacity to purchase lands for themselves and successors; but they are excepted out of the statute of wills; so that no devise of lands to a corporation by will is good; except for charitable uses, by statute 43 Eliz. c. 4. which exception is again greatly narrowed by the statute 9 Geo. II. c. 36. And also, by a great variety of statutes, their privilege even of purchasing from any living grantor, is much abridged; so that now a corporation, either ecclesiastical or lay, must have a licence from the king to purchase, before they can exert that capacity which is vested in them by the common law: nor is even this in all cases sufficient. These statutes are generally called the statutes of *mortmain*. See *MORTMAIN*.

The general duties of all bodies politic, considered in their corporate capacity, may, like those of natural persons, be reduced to this single one:—that of acting up to the end or design, whatever it be, for which they were created by their founder.

III. How corporations may be dissolved. Any particular member may be disfranchised, or lose his place in the corporation, by acting contrary to the laws of the society, or the laws of the land: or he may resign it by his own voluntary act. But the body politic may also itself be dissolved in several ways: which dissolution is the civil death of the corporation: and in this case their lands and tenements shall revert to the person, or his heirs, who granted them to the corporation: for the law doth annex a condition to every such grant, that if the corporation be dissolved, the grantor shall have the lands again, because the cause of the grant faileth. The grant is indeed only during the life of the corporation; which may endure for ever: but, when that life is determined by the dissolution of the body politic, the grantor takes it back by reversion, as in the case of every other grant for life. The debts of a corporation, either to or from it, are totally extinguished by its dissolution; so that the members thereof cannot recover, or be charged with them, in their natural capacities: agreeably to that maxim of the civil law, "*si quid universitatis debetur, singulis non debetur; nec, quod debet universitas, singuli debent.*"

A corporation may be dissolved, 1. By act of parliament,

which is boundless in its operations. 2. By the natural death of all its members, in cases of an aggregate corporation. 3. By surrender of its franchises into the hands of the king, which is a kind of suicide. 4. By forfeiture of its charter, through negligence or abuse of its franchises; in which case the law judges that the body politic has broken the condition upon which it was incorporated, and thereupon the incorporation is void. And the regular course is to bring an information in nature of a writ of *quo warranto*, to enquire by what warrant the members now exercise their corporate power, having forfeited it by such and such proceedings. The exertion of this act of law, for the purposes of the state, in the reigns of King Charles and King James II. particularly by seizing the charter of the city of London, gave great and just offence; though, perhaps, in strictness of law, the proceedings in most of them were sufficiently regular: but the judgment against that of London was reversed by act of parliament after the revolution; and by the same statute it is enacted, that the franchises of the city of London shall never more be forfeited for any cause whatsoever. And, because by the common law corporations were dissolved, in case the mayor or head officer was not duly elected on the day appointed in the charter, or established by prescription, it is now provided, that for the future no corporation shall be dissolved upon that account; and ample directions are given for appointing a new officer, in case there be no election, or a void one, made upon the charter or prescriptive day.

CORRADINI *de Sezza* (Peter Marcellinus), a learned civilian and cardinal, born at Sezza in 1678, acquired the esteem and confidence of Clement XI. and died at Rome in 1743. He was the author of a learned and curious work entitled *Verus Latium profanum & sacrum*, 2 vols. folio; and a history of Sezza, in 4to.

CORRADO (Sebastian), an Italian grammarian of the 16th century, taught the Greek and Latin tongues at Reggio, where he formed an academy of polite literature; and at length removed to Bologna, in order to be professor of those languages. He wrote several works, the most esteemed of which are, *Questura in qua Ciceronis Vita refertur*, an excellent performance; and, *De Lingua Latinâ*. He died in 1556.

CORREGIO, a town of Italy, capital of a territory of the same name, in the duchy of Modena, with a castle, 9 miles N.E. of Reggio. Long. 11. 12. E. Lat. 44. 46. N.

CORREZE, a department of France, containing the late province of Limosin. Tulle is the capital.

CORSHAM, or COSHAM, a town in Wilts. The Saxon king, Ethelred, had a palace here. Edmund earl of Cornwall, in the reign of Edward I. obtained a charter for a market; and the inhabitants still enjoy some privileges granted them by Richard, his predecessor. Their chief support is the woollen manufacture, here being some considerable clothiers. This place is four miles S.W. of Chippenham.

CORSICA, an island in the Mediterranean, 88 miles in length, and 40 in breadth. The air is unwholesome, and the land hilly, full of stones, and poorly cultivated; however, the valleys produce wheat, and the hills, olives, figs, grapes, almonds, and chestnuts. They have horses also, of a fiery nature. There are mines of iron, and a great deal of fish and coral on the coast. In the middle, is the mountain Gradaccio, where there are two lakes near each other, whence proceed the two principal rivers. A ridge of mountains divides the island into two parts, the N. and S. The capital is Bastia. It belonged to the Genoese; but the natives having been for many years in revolt against them, that

state surrendered its right to France, of which Corfica is now a department. Long. 9. 0. E. Lat. 42. 0. N.

CORSOER, a town of Denmark, on the W. side of the Isle of Zealand, on a small peninsula, on the Great Belt, which separates Zealand from Funen. It has a good harbour for light vessels, and is defended by a citadel. Long. 11. 12. E. Lat. 55. 12. N.

CORSTORPHIN, a village of Scotland, three miles W. of Edinburgh, situated on the declivity of a beautiful hill, and noted for its cream.

CORTE, a town of Corfica, with a strong castle, 27 miles S.W. of Bastia.

CORTIS, a town of Germany, in the bishopric of Liege, 10 miles N.E. of Ramillies. Long. 4. 59. E. Lat. 50. 46. N.

CORVO, the smallest island of the Azores, having only about 600 inhabitants, who cultivate wheat and feed hogs. Long. 31. 5. W. Lat. 39. 42. N.

CORYATE (Thomas), a very extraordinary personage, who seems to have made himself famous by his whimsical extravagancies, was the son of a clergyman, and born at Oldcombe in Somersetshire in 1577. He acquired Greek and Latin at Oxford; and coming to London, was received into the household of Henry prince of Wales. If Coryate was not over-witty himself, he got acquainted with the wits of that time, and served to exercise their abilities, having more learning than judgment. He was a great peripatetic; for, in 1608, he took a long journey on foot; and after he returned, published his travels under the following strange title, *Crudities hastily gobbled up in five months Travels in France, Savoy, Italy, Rhetia, Helvetia, some parts of High Germany, and the Netherlands*, Lond. 1611, 4to. In 1612 he set out again, with a resolution to spend ten years in travelling: he went first to Constantinople; and after travelling over a great part of the East, died of a flux at Surat in the East-Indies. Some of the accounts of his peregrinations are to be found in the accounts of Purchas's Pilgrimages.

CORYVREKAN, a dangerous whirlpool on the W. coast of Scotland, between the isle of Scarba and the N. point of that of Jura. It is so named from a young Danish prince, who perished in this place. As the tide advances, this unfathomable gulf, of which the dreadful vortex extends above a mile in circuit, begins to boil up; and, at full sea, its numerous eddies form watery pyramids, which rise into the air, and bursting with the noise of thunder, whiten the subjacent waves with foam. Many smaller whirlpools and rapid currents are found in the neighbourhood; dangerous, however, to those only who are strangers to the coast.

COSLIN, a town of Germany, in Prussian Pomerania, 10 miles E. of Colberg.

COSNE, a town of France, in the department of Nièvre, and late province of Nivernois. Anchors for ships are forged here; and its cutlery and gloves are much esteemed. It is seated at the confluence of the Loire and Noain, 88 miles S. of Paris. Long. 3. 6. E. Lat. 47. 23. N.

COSIMBAZAR, a small city of Hindoostan Proper, in Berghal. It has been at all times the residence of the different European factors; this being the centre of their trade. It is seated on an island in the western arm of the Ganges, 110 miles N. of Calcutta. Long. 85. 22. E. Lat. 23. 40. N.

COSTAGNAZZAR, the highest mountain of Turkey in Europe, in Romania, anciently called Hæmus.

COSTUME (*Encycl.*). Those antiquaries who have treated of the ancient Irish costume, should have consulted the old French satirist, the Sieur d'Auvray, in whose work, entitled the *Banquet*

des Muses, ou Recueil de toutes les Satyres, Yambes, Macarades, &c." (Rouen. duod. 1623), among many other curious passages, are the following allusions to the mantles of the true or aboriginal Hibernians:

"Il jugeoit à l'œil et au pas
Les filles d'amoureux appas,
Comme les Laquais aux mandilles,
Aux mantes les vrais Irelandois,
Aux chapeaux longs les Albanais,
Et les Espagnols aux roupilles."—p. 324.

"Un chapelet pour avoir bonne grace,
Un pelisson, un capot d'Irlandois," &c.—p. 336.

On the subject of our old English dresses, one of the most curious passages we recollect, is to be found in a work where few readers would expect it:—Fuller's *Pilgrimage-Sight of Palestine*: folio, 1662; book 4. ch. 6. Speaking of the various habits and ornaments of the Jews, he noticed the changes they underwent, and in a digression, says, "For instance, it would pose a good antiquary to describe the exact fashion of *hardlots, gits, haketons, paltocks, tabards, court-pieces, chevefailes, and gipiers*: barbarous names, which may seem to carry a spell or conjuration in the mention of them. Yet all these were kinds of garments commonly used in England, some four hundred years ago. Yea, pride, playing in all ages upon conceited opinions of decency, hath infinitely varied the fashion of all apparel; custom of our ancestors appearing antick to us, as our fashion (perchance) will seem incredible to posterity. Who would believe that ever our English, some four hundred years since, wore shoes pointed and picked more than a finger long, crooking upwards (called crackowes), resembling the devil's claws, which were fastened to the knees with chains of gold, and silver? Or, that about the reign of King Henry the Fifth, man grew so excoffive in that kind, that it was fain to be ordered by proclamation, that none should wear their shoes broader at the toes than six inches?"

COTE D'OR, a department of France, containing part of the late province of Burgundy. Dijon is the capital.

COTELERIUS (John-Baptist), fellow of the Sorbonne, and king's Greek professor, was born at Nîmes in Languedoc in 1627. He made a collection of the fathers who lived in the apostolic age, which he published at Paris in two volumes folio in 1672; all reviewed and corrected from several MSS. with a Latin translation and notes. He also published *Monumenta Ecclesiæ Græcæ*, in 3 vols. being a collection of Greek tracts out of the king's and M. Colbert's libraries, and which had never been published before: to these he added a Latin translation and notes. He intended a further prosecution of this work; but his intense studies broke his constitution, and deprived him of life in 1686. Besides his great skill in languages and ecclesiastical antiquities, Cotelierius was remarkable for his probity and candour.

COTES (Roger), an excellent mathematician of the 18th century. He early discovered an inclination to the mathematics; and, at 17 years of age, was admitted a pensioner of Trinity College, Cambridge. In 1706 he was appointed professor of astronomy in the professorship founded by Dr. Plume, archdeacon of Rochester, being chosen the first in that chair for his great merit and learning. In the year 1713, at the request of Dr. Richard Bentley, he published at Cambridge, in quarto, a second edition of Sir Isaac Newton's "Principia," with all the improvements which the author had annexed thereto; to which he prefixed an excellent *Preface*. He prepared several useful books for the public; and wrote *A Description of the great Meteor* which appeared on the 6th of March, 1716, published

in the Philosophical Transactions. He lived but a little while to carry on the discourses for which he was eminently qualified; dying in the prime of his age in 1716, to the great regret of all the lovers of the sciences.

COTES DU NORD, a department of France, so named from its northerly maritime position, and containing part of the late province of Bretagne. St. Brioux is the capital.

COTTAGER, the lowest description of peasant in England; so called from his usual residence being in a Cot, or Cottage, situated on some waste, or by the road side.

During the late scarcity, various efforts were made by the society in London for bettering the condition of the poor (see SOCIETY, *Supp.*), to assist this useful class of agricultural labourers, many of whom were burthened with large families. From their Reports we extract the following account of a cottage and garden near Tadcaster, by Thomas Barnard, &c.

"Two miles from Tadcaster," says he, "on the left-hand side of the road to York, stands a beautiful little cottage, with a garden, that has long attracted the eye of the traveller. The flip of land is exactly a rood, inclosed by a cut quick hedge; and containing the cottage, fifteen apple-trees, one green-gage, and three wincefour plum-trees, two apricot-trees, several gooseberry and currant bushes, abundance of common vegetables, and three hives of bees; being all the apparent wealth of the possessor. The singular neatness and good order that marked every part of this little domain, and some circumstances respecting the owner, which had been mentioned to me by Dr. Burgh of York, made me anxious to obtain the history of the cottager and his family. In the end of May, 1797, I called there in my way from York; but found the house and the gate of the garden locked. In the road to Tadcaster, however, I met his wife, laden with a basket of provisions from the market; and engaged her to find her husband, who was at work about a mile off, and to send him to me at the inn at Tadcaster. When he arrived he very willingly gave me his history, as follows—

"His name is Britton Abbot: his age sixty-seven, and his wife's nearly the same. At nine years old he had gone to work with a farmer; and being a steady careful lad, and a good labourer, particularly in what is called talk-work, he had managed so well, that before he was 22 years of age, he had accumulated near 40*l.* He then married, and took a little farm at 30*l.* a-year; but before the end of the second year he found it prudent, or rather necessary, to quit it; having already exhausted, in his attempt to thrive upon it, almost all the little property that he had heaped together. He then fixed in a cottage at Poppleton; where, with two acres of land, and his common right, he kept two cows. Here he had resided very comfortably; as a labourer, for nine years, and had six children living, and his wife preparing to lie in of a seventh, when an inclosure of Poppleton took place; and the arrangements made in consequence of it, obliged him to seek for a new habitation, and other means of subsistence for his family.

"He applied to Squire Fairfax, and told him that, if he would let him have a little bit of ground by the road-side, 'he would shew him the *fashions* on it.' After enquiry into his character, he obtained of Mr. Fairfax the ground he now occupies; and with a little assistance from the neighbours, in the carriage of his materials, he built his present house; and planted the garden, and the hedge round it, which is a single row of quick, thirty-five years old, and without a flaw or defect. He says he cut it down six times successively when it was young. Mr. Fairfax was so much pleased with the progress of his work, and the extreme neatness of his place, that he told him he should be rent free. His answer deserves to be remembered: 'Now,

fir, you have a pleasure in seeing my cottage and garden neat; and why should not other fquires have the same pleasure, in seeing the cottages and gardens as nice about them? The poor would then be happy; and would love them, and the place where they lived; but now every little nook of land is to be let to the great farmers; and nothing left for the poor, but to go to the parish?'

"He has had seven children; six of whom attained to man's estate; and five are now living, and thriving in the world. His son has a little farm near Hemley Moor; one of his daughters is the wife of a joiner at York; another, of the occupier of a little farm at Kelfield; a third, of a labouring man, who has a little land of his own, near Duifield; the fourth is the wife of a labourer, who has built a cottage for himself at Tadcaster, and wants nothing (as the father observed) but a bit of ground for a garden. Britton Abbot says he now earns 12*s.* and sometimes 15*s.* and 18*s.* a-week, by hoeing turnips by the piece; setting quick, and other talk-work; but, 'to be sure,' he added, '*I have a grand character in all this country.*' He gets from his garden, annually, about forty bushels of potatoes, besides other vegetables; and his fruit, in a good year, is worth from 3*l.* to 4*l.* a-year. His wife occasionally goes out to work; the allo spins at home, and takes care of his house and garden. He says they have lived very happy together for forty-five years.—To the account that I have given, it may be needless to add, that neither he, nor any part of his family, has ever had occasion to apply for parochial relief.

"Though my visit was unexpected, and he at the latter end of his Saturday's work, his clothes were neat and sufficiently clean; his countenance was healthy and open; he was a little lame in one leg, the consequence of exposure to wet and weather. He said he had always worked hard and well; but he would not deny but that he had loved a mug of good ale when he could get it. When I told him my object in enquiring after him, that it was in order that other poor persons might have cottages and gardens as neat as his, and that he must tell me *all his secret*—how it was to be done, he seemed extremely pleased, and very much affected; he said, 'nothing would make poor folks more happy, than finding that *great folks thought of them*;' that he wished every poor man had as comfortable a home as his own; not but that he believed there might be a few *thriftless fellows*, who would not do good in it.

"I asked him whether he had not a cow. He said he had had one, and she had died; and having no other place but the lane to keep his cow, he had not attempted to get another.—'Could you get land, if you had a cow?'—He thought he could.—'Supposing then (I added) a cow could be bought for 2*l.* and you could rent it on the terms of paying down 3*l.* 10*s.* immediately; and then 3*l.* 10*s.* at the end of each year during three years; and that the cow was to be yours at the end of the three years, if she lived, and you paid your rent regularly:—Do you think such a bargain would answer for you?'—Yes, he said, he was sure it would very greatly; and there were few cottages to whom it would not be a very great advantage; especially where they had a family of children. I told him to enquire whether he could get a little land; and I would have some more talk with him about it, when I came down in August.

"The history of Britton Abbot appears to me to merit attention. At the time of the inclosure of Poppleton, when he had six young children living, and his wife preparing to lie in of the seventh, his whole little system of economy and arrangement was at once destroyed; his house, his garden, his little field, taken from him; and all his sources of wealth dried up. With less success in his application for the rood of land, the

spot in which his industry was to be exerted, and (in justice to him it must be added) with less energy than he possesses, he might have gone with his family into a workhouse; and, from that hour, have become a burthen to the public, instead of being one of its most useful members. Observe for a moment the effects of his well-directed industry. Without any parochial aid, he has raised six of his seven children, to a state of maturity; and has placed them out respectably and comfortably in the world. Five of them are now living, in the middle period of life; and he continues, at the age of sixty-seven, a good working labourer; happy in his own industry and good management, and in the beauty and comfort of his cottage, and the extreme fertility of his garden.

"Britton Abbot possesses a degree of energy and spirit, that we must not expect to find in every cottager. If, however, the poor do not exert themselves, and have not so much forethought and management as might be wished, the fault is less in them, than in the system of our poor laws, and in the manner in which they are executed. Were they properly and universally encouraged to industry and economy, we should soon find thriving and happy cottagers in every part of the kingdom. Let only a tenth of the money, now spent in workhouses, in what is usually called '*the relief of the poor*,' be applied in assisting and encouraging them to thrive and be happy in their cottages, the poor's rate will be lessened, and, a national saving made both in labour and food*. The labourer is capable of more exertion, and is maintained for less than half the expence, in his cottage than in a workhouse. In his cottage he has his family around him, he has something he can call his own, he has objects to look forward to, and is the master of his own actions.—*Domestic connections, property, liberty, the hope of advancement*, those master springs of human action, exist not in a workhouse.

"It is the misfortune of this country, that the well-disposed and industrious poor do not receive sufficient aid or encouragement. They find no distinction made between them and the idle and profligate; except this—that *the idle and profligate are maintained in part at their expence*. As the law is too frequently executed, the cottager, though poor himself, is regularly assisted for the relief of the poor; but he receives no benefit from the fund, no assistance towards the support of himself and his family, unless he is reduced to absolute want, and presents himself hopeless at the door of the workhouse.

"The evil has been greatly increased by the ninth of George I. which authorises the farming of the poor, and refuses relief to those who will not submit to reside in the workhouse. It is, in consequence, the interest of the farmer of the workhouse, to keep it in such a condition, that (to use Mr. Parry's words) 'the honest and industrious labourer, who has brought up a large family with credit, and who from misfortune is poor, and from age past his labour, will submit to be half starved, rather than take up his abode amid such wretchedness and profligacy.' By these means workhouses become objects of terror to the honest and industrious, and at the same time the favourite resort of the dissolute and abandoned; the dirt, the waste, the disorder, the want of regulation, and the *undistinguishing treatment* of the worst and best characters, being as gratifying to them, as they are irksome and disgusting to the well-disposed poor.

"Let us consider what must be the effect of this system on the cottager.—Tenant to the farmer who has taken his cottage over his head, he is aware that his new landlord will require as much rent as he can contrive to pay. He has a young and increasing family; and, when times are at the best, he often finds it as much as he can do to go on, from one day to another, in their support. He can hardly expect that during the severity of the winter, the high price of bread, or the visitation of sickness, his earnings will always, and at all seasons, continue equal to the necessities of his family. If the hour of adversity arrives, he knows the rule of his parish, that '*no assistance is to be given to the labourer, while he possesses any thing of his own*;' and that what, with much labour and self-denial, he shall have saved, must all be exhausted and spent, before his claim to parochial relief can be admitted. It may be well to consider what incitement he has to thrift and forethought. Can we confidently answer for ourselves, that, so circumstanced, we should act even as well, and look as much to futurity, as he does; or that we should not be made more sensuallists by dependency? It is perfectly clear, that we should not spend every penny, that could be spared from the daily nourishment of our families, in self-indulgence at an ale-house?

"Happy should I be, if I could make use of the history of Britton Abbot, to obtain for the labourer encouragement to imitate the energy of his industry. Of the different modes of aiding and animating the poor, none would have more tendency to raise them above the want of parochial aid, than that of enabling them progressively to follow his example, in such a manner, that the most deserving might in their turn become the owners of comfortable cottages and productive gardens; a measure which seems to be peculiarly called for by the present condition of the dwellings of the poor. It is a melancholy fact that, in most parts of England, their habitations are not only comfortable and devoid of accommodation, but insufficient in number; and that honest and industrious families are frequently driven into the workhouse, merely for the want of cottages in their parish.

"If the custom of setting apart ground for them to build upon were to obtain generally, and in a manner to induce and enable them to take the benefit of it, it would assist in gradually correcting this national and increasing evil, and in supplying that useful class of men with proper habitations.—It would have other very important effects. It would diminish the calls for parochial relief; it would encourage and improve the good habits of the poor; it would attach them to their parishes, and give them an increased interest and share in the property and prosperity of their country. The land required for each cottage and garden, need not be more than a rood; the value of which would bear no possible comparison to that of the industry to be employed upon it. The quarter of an acre that Britton Abbot inclosed, was not worth a shilling a year. It now contains a good house and a garden, abounding in fruit, vegetables, and almost every thing that constitutes the wealth of the cottager. In such inclosures, the benefit to the country, and to the individuals of the parish, would far surpass any petty sacrifice of land, to be required. *Five unsightly, unprofitable, acres of waste ground would afford habitation and comfort to twenty such families as Britton Abbot's*.

"In order to encourage the exertions of the labourer, I

* This experiment would be easily tried. Suppose the poor's rate of the parish so applied to be 6ool. a-year; and that 6ol. a-year of the rate were to be annually employed in assisting the most industrious and deserving labourers to become possessors of cottages and cows: I am confident that the poor's rate of that parish would be greatly diminished in a few years; probably to half its present amount. The difference between a law that encourages the poor to exertion, and one that attempts to compel them to it, is, that in the first you have the co-operation of the millions of the people who are to be objects of the law; in the second, all the labour is thrown on the *unfortunate and unsuccessful persons*, who are to attempt to execute it.

should hope that this would be conceded to me, that the rood of land, inclosed for his cottage and garden (on condition of a house being erected) be held in fee simple; and that, so long as a parishioner, labouring generally within his parish, continued owner and occupier, such cottage and garden should, by parliamentary authority, be exempt from rent, taxes, rates, tithes, and all burthens whatsoever. It would be an important object to keep these little freeholds in the hands of the labourers of the parish; so that they might be transmitted from father to son, like those little estates, which we contemplate with so much pleasure in Borrodale. If, therefore, the exemption from rent, taxes, &c. continued no longer than while the cottage was both the property and residence of a parishioner, generally working within his parish, it would not be of half as much value to any other person, as to him for whom it was originally intended; and if in some instances they got into other hands, they would soon return again into the possession of the labouring parishioners.

"As the means of promoting industry and good conduct among the poor, I should hope that a preference would be given to 'industrious parishioners, members of friendly societies,' and that the character of the man, the number of his children, and other circumstances, would induce the farmers to give him the carriage of his materials, and his other neighbours to help him with a pecuniary subscription. The annual sum of 10l. or 20l. so collected in a parish, and impartially and publicly given as a premium to the most deserving labourer in that parish (either to assist him in erecting his cottage, or to enable him to purchase his cow), would produce a great effect on the good habits of the poor; and, while it rewarded merit, would stimulate others to follow the example.

"It would have other important effects.—It would greatly diminish parish rates*; for he who possesses a freehold cottage and garden, or a cow, has seldom, if ever, occasion to apply for parochial relief. By attaching the cottager to his own parish, it would secure to the farmer a certain supply of labourers, and would equalize, and keep down, the price of labour, now much enhanced by the disposition to wander about, in quest of the highest wages and the easiest work; a disposition which has occasioned a considerable waste in the produce of national labour. But this would not be all. Freehold cottages and gardens do not only attach the owners to their country, but are also the surest pledges and securities for their conduct. The cottager, who has property, is habituated to set a higher value on himself and on his character, and seems to be of a superior order of men. Besides this, the addition, which these little freeholds might make to the industry, morals, and produce of a country, would be an object of consideration in this respect; that the cottager, who had a garden and a little property of his own, has always before him a *pleasurable object of industry* for his leisure time; whereas, he who has none, is driven to the ale-house by the same *unhappy necessity*, that

impels idle young men to the gaming table;—the want of occupation.

"In the mode which I suggested to Britton Abbot, of his renting the cow, he would acquire a gradually increasing interest in her; so as to make him anxious for her preservation, but not such as to involve him deeply, in case of her death, or to give him a right to dispose of her. In this way, the sum of 11. † would be sufficient to constitute a *perpetual fund*, in any parish, for supplying the *annual premium* of a cow for some industrious and well-disposed labourer, as long as the landlord will consult his own interest, and afford the means of feeding her. Whether this object is to be attained by annexing ground to the cottages, or by letting to the cottager an adjutment for his cow, or by supplying him with pasture, and a certain quantity of hay ‡, at an annual rent; or by making it one of the conditions on which the farmer takes his farm, that he shall keep his cottager's cow at a limited price;—whatever mode is to be adopted, will depend much on the circumstances of the country.—There is hardly any part of England, however, in which the cottager's cow may not be provided for, by one or other of these means; or by another mode, which I should prefer, when practicable, as the right which it would give the poor man would be *unalienable*;—and that is, inclosing and improving from the waste §, cow pastures of ten or twelve acres each; the exclusive benefit whereof, the cottagers of the parish should enjoy at a small rent; which (after providing for fences, &c.) might go as a fund for supplying the poor of the parish with fuel. Such inclosures would be extremely gratifying and beneficial to that useful class of men, the labouring poor. The stock on them should be limited; and a preference given to labourers working within the parish, in proportion to their families, their industry, and character.

"I have only to add, that my friend's history contains in it a strong proof, that, the cottager is benefited by the supply of a garden and of land for his cow, while he continues a *labourer*; yet, if more land is added, just enough to constitute him a *little farmer*, with a very small capital, and to make him forego his profit and advantage as a labourer, his means of life, instead of being improved by the acquisition of land, are prejudiced. No persons earn a harder or more precarious living, or do less good with their land, than very small farmers. The condition of a labourer, who has a well-stocked garden, a couple of cows, a pig, and just ground enough to keep them, is affluence, compared with the lot of him, who attempts to live as a farmer, on a small quantity of ground, not sufficient to maintain him as a farmer, though abundantly adequate to its object, if divided among several labourers."

The following extract from an account of the advantages of cottagers keeping cows, also by Mr. Bernard, will still further prove how possible it is to rescue this industrious class of labourers from want and misery.

"A late visit into Rutlandshire," says the author, "has

* Landlords and farmers, who with their own poor's rates reduced, would do well to enquire into the amount of the poor's rates in those parishes, where labourers have gardens and cows. One annual rate of sixpence in the pound has proved fully adequate to the relief of the poor in such a parish. See the Earl of Winchelsea's letter, and some other reports, on the advantages of cottages renting land.

† Upon supposition that the price of the cow were 12l. the donor of such a fund would have to advance 8l. 10s. the first year, 5l. the second, and 1l. 10s. the third; after which the rest of 3l. 10s. paid for three years, for each cow, would produce, in future, 12ol. 10s. a-year; being (with 3l. 10s. originally paid by the cottager) 21. more than would purchase a cottager's cow every year after. The additional 21. a-year would, I presume, be sufficient to insure, for the year, the landlord's interest in the cows.

‡ Mr. Burdon's cow pastures are closes of sixteen acres, for twelve cows each: he allows each cottager two loads of hay; making the hay in small stacks of four loads each, so that one stack serves two cottagers. He finds the system answer, both as to the improvement of ground, and the amount of rent. I can only say, that when I was at Castle Eden, I thought his cottagers' hay-stacks and cows the most pleasing ornaments of a very beautiful place.

§ This plan has been adopted in the Iwer inclosure bill now before parliament. 31st May, 1800.

given me an opportunity of acquiring more minute and correct information, respecting the circumstances and situation of the cottagers keeping cows, in the four parishes of Hambleton, Egleton, Greetham, and Burley-on-the-Hill. I give the result of my enquiries; and I give it with more precision and detail than I otherwise should, as I am very desirous of enabling land-owners to ascertain whether, in their own peculiar instances, it will not answer for them to follow the example of what has been done in that neighbourhood. At the same time I beg leave to anticipate the observation, that in arable countries, where there is a scarcity of grafs land, and in those districts where, from vicinage or a peculiar market, grafs land bears a rent above its intrinsic value, it may not be practicable to supply cottagers with pasture for a cow, without some sacrifice on the part of the landlord.

"Among the tenants of this part of the estate, there are 80 cottagers who keep cows. Of those who possess cows, there are 22, each of whom has only one cow; 35 who have each 2 cows, 13 who have 3, 7 who have 4, and 3 who have 5 cows each; making in all 174 cows. Of these cottagers, about a third part have all their land in severally; the rest of them have the use of a cow-pasture in common with others; most of them possessing a small homestead, adjoining to their cottage; every one of them having a good garden, and keeping one pig at least, if not more. Without any exception they pay for their land the same rent as a farmer would, and not more.

"The estate is tithe-free.—In Hambleton there is a close of 114 acres, which is let in 108 cow-gates, at one guinea each; of these, 74 are let to cottagers, and the remaining 34 (not having been as yet applied for by cottagers) are for the present let to farmers. The tenants have the right of feeding, each four sheep, instead of a cow, for each cow-gate; and the farmers generally so use their holdings, which is more for their own convenience, as well as for the general benefit of the pasture. Each of the cottagers has also an acre or more of homestead near his cottage, for which he pays a farmer's rent.

"At Egleton there is a cow-pasture of only 30 acres, which is let in 26 cow-gates, each at 50 shillings. These are all occupied by cottagers, who have also small homesteads near their houses, to supply them with hay.—In the parish of Burley, the mode of providing for some of the cottagers' cows is different: a close of 11 acres and a half is divided into two equal parts, and the whole jointly occupied by four cottagers. One half is every alternate year held in four several parts by a marked boundary, each mowing his own part for hay; the other half is a cow-pasture for the four cottagers. They have each a right of putting in a cow and two sheep in the pasture part, during the summer, and of feeding a cow and four sheep upon the whole in the winter. The benefit of the sheep feeding they can let to a farmer at a guinea and a half a-year. Besides this, they have grafs and hay for one cow; for rent they pay 4l. 10s. a-year each, and in poor's rates and other levies, 5s. a-year, making in the whole 4l. 15s.; from which, after deducting 1l. 11s. 6d. (which their sheep feeding is worth), there remains 3l. 3s. 6d. rent and taxes, for the support of their cow.

"The accommodation that the cottager has for his cow in Greetham, is not so beneficial to him. A pasture-field of 35 acres of indifferent land, worth about 10s. an acre, is held as a joint pasture by 14 cottagers; each of whom has a right to pasture a cow in it. For their winter provision they have each of them an arable field of six acres, in which they grow some clover and sainfoin. This is by no means so advantageous to them as grafs land: under these circumstances, however, they

are very glad to have the land, and always pay their rent with great regularity.

"I said that the cottagers paid a farmer's rent for their land, and not more; but I ought to add, that the whole of the estate is let at moderate rents. The reader may find by calculation, that in Hambleton the land produces, per acre, nearly 20s.; in Egleton, about 23s.; and in Burley, 31s. per acre; the difference being occasioned partly by the difference of time, when the closes were respectively let at their present rents, and partly by some difference in the quality of the land.

"The cottagers who keep cows are almost all of them labourers in husbandry: there are, however, among them, some widows and daughters of deceased labourers, and some men who work as country carpenters, or in similar trades. I can add, that of all the rents of the estate, none are more punctually paid, than those for the cottagers' land. The steward informs me that there has never been an instance of an arrear, or of a delay in payment, even for a few days.

"When I state that the land is let at, and not under, a fair, moderate rent, I do not mean to be understood to say, exactly the same of the cottages; which are comfortable and habitable buildings, in good repair, neatly kept, and regularly white-washed; and yet pay no more rent, than the ruinous and miserable hovels in England usually do.

"The reader may, perhaps, wish to know how the cottager is at first set up with a cow. As an example, I will give the history of one man, who had a wife and several children, and was last year likely to be burthened to the parish. It was agreed that the only remedy that promised relief to the parish in this case, was the cottager's cow. His landlord supplied him with land at a fair rent, and made his cottage and out-buildings comfortable. He asked assistance of his neighbours: in the mansion-house he collected about two or three guineas; among the farmers, by gift or loan, he obtained some handsome additions; he purchased his cow, took possession of his land, and is now doing very well.—About eight years ago another labourer with a large family was supplied with a cow, and land, in the same manner. He has since bred up his large family without any parochial assistance, and is now possessed of two cows, the second purchased wholly from his savings. Two others were provided with cows and land in the like manner, about four years ago, and have gone on very well.

"The greater part of the cottagers have more than one cow. The fact is, that in every instance, as soon as the cottager has got a cow, all the efforts of his family are directed to the attainment of the means to purchase another, and another; so that some of them, who began very lately with only one, have now five cows. The only inconvenience to be apprehended from such an increase in their property, is, that they may be induced to look to the produce of their cows and gardens, for the sole support of themselves and family, and cease to depend on their daily labour for their support; being transformed into little starving farmers, from opulent thriving labourers. But the fact is directly the reverse.—Such are the beneficial effects of early and steady habits of industry, that these proprietors of cows are the most steady and trusty labourers. As a proof of the effects of this system in promoting industry and frugality, I give the history of one of them, Christopher Love, of Hambleton; who is now 75 years of age, and has for 53 years back kept three cows; and nevertheless has gone regularly every summer, for 50 years past, to harvest-work in Cambridgeshire: because he is more in request there, and receives better wages, than he would at home. He has bred up a family of nine children in great comfort, and is now well and in good health himself, and has been in Cambridgeshire this

preceding harvest; but thinks he shall go no more, as the family for whom he used to work are all dead, or removed.

"I saw one instance among them of a man who was bringing up and supporting nine children, all healthy, well fed, clean, and neatly dressed. A little child under four years of age was asked if he could spin? 'No, she was too little, but she could knit.' Her sister (said the mother, pointing to another girl, between five and six years of age) spins very well; she got a prize for spinning this year, and brought home a premium of the value of six shillings in clothing."

"The education of their children to husbandry, to the management of cattle and of a dairy, and to every occupation that can fit them for the service of a farmer, is a very important advantage of this system: and if there were no other benefit to be derived from it, but that of adopting, and habitually preparing, the rising generation for the most useful and necessary employment in the island, this alone would produce an abundant compensation for any effort, or attention, that has been, or may be, directed to the subject. They are not only stout, healthy, clean, well clothed, and educated in regular and principled habits of life, but they are used to almost every part of their business from the earliest period of life; every inhabitant of the cottage being, from infancy, so interested in their cow, their pig, their sheep, and their garden, as to imbibe, at a very early age, all the material information and habits requisite in those subjects."

"The cottagers in that country eat barley, or mixed, bread; and they prefer it, for a reason which one of them gave me; that not only they can afford to have more of it, but can also add a little bit of meat to dress with the vegetables from the garden. This makes in the aggregate a very important amelioration of the condition of the cottager:—bread, butter, cheese, plenty of milk, and vegetables, and some meat to mix with their other food, compose, altogether, a table of diet unknown to many English cottagers, and extremely conducive to health, strength, and civilized habits of life. It is no inconsiderable convenience to the inhabitants of that neighbourhood, that these cottagers are enabled to supply them, at a very moderate price, with milk, cream, butter, poultry, pig-meat, and veal: articles which, in general, are not worth the farmer's attention, and which, therefore, are supplied by speculators, who greatly enhance the price on the public."

These facts are accompanied with the following pertinent observations,

"In preparing this detail," says Mr. Bernard, "I have endeavoured to give every circumstance as coldly and correctly as I could; being aware that, in practical information, precision is of the utmost importance. I will not, however, presume to say, that in what I have written, I have been entirely uninfluenced by the pleasure of seeing the English cottager what, in a free, a prosperous, and enlightened country, he ought to be—*thriving, industrious, and happy.*"

"What has been stated will probably suggest to the reader, that the welfare of the cottager depends more on the improved resources and habits of life, than on any increase or superabundance of wages. In countries where the wages are the highest, without any improved system of management and economy among the poor, the condition of the cottager is very inferior to that in many places, where the wages of labour are lower, but the means and habits of life superior. Mechanics, who earn from a guinea to two guineas a-week, in London, in Manchester, and other places, and who depend upon the neighbouring shop for the necessities of life, and (to use a common expression) *live from hand to mouth*, do in general possess a less degree of domestic comfort, and enjoy a less proportion of the advantages of civilized life, than many cottagers. The expli-

cation is obvious. The mechanic, who with his family exists in a lodging, without any advantage or impulse tending to domestic economy, and who earns, by a species of *flight of hand* in his trade, very high wages, applies what is barely necessary, in a weekly payment, to the baker and other tradesmen, for the support of the family; the rest goes to the club, or the alehouse, or is lost in intervals between labour: while the labourer and his family, who have the power and inducement to thrift and management, direct every effort to the improvement of their circumstances, and the increase of their comforts."

"It will, to the latest period of my life, be a source of enviable satisfaction to me, if what is said in this and the other report of the society, shall have the effect of awakening the attention of the land owner to an object so interesting and essential to him, as the situation of his industrious labourers; whose comforts and means of life he may greatly increase, not only without any immediate loss, but with a real and accumulating benefit to himself and his property; as he would soon find that by improving the condition of his dependents, and by exciting industry among them, he would proportionally increase the value of his estate. It would, indeed, be an act not only of benevolence and justice, but of wisdom and prudence, whether he directed his views to his own insulated property, or to the general welfare of the community.—Viewed in a political light, the labourer who has property, however small,—a cow, a pig, or even the crop of his garden,—has an interest in the welfare and tranquility of his country, and in the good order of society. He who has no property, is always ready for novelty and experiment; and though gibbets and halters may for a time deter him from criminal and atrocious acts, yet no motive exists to fix him in virtuous habits, or to attach him to that national prosperity in which he has no part, and to that constituted order of property, which excludes him from all possession."

"There is another consideration, suggested by the present high price of wheat corn. Those measures for the relief and subsistence of the poor, which are now essential to their existence in many other parts of the kingdom, are unnecessary in the neighbourhood of Burley. The cottager who is in the habit of using barley in bread, who keeps a pig, perhaps two, and has plenty of milk and vegetables, possesses within himself almost all the means of life; and feels very little inconvenience from that which, without the charitable aid and attention of the opulent, would oppress and overwhelm the labourer whose existence depends on a mere pecuniary stipend. With such means of life, he is less affected by the present high price of bread than almost any other individual: the dearth of provisions produces not much variation in his circumstances; except by delaying, for a very short time, the desired period of his purchasing another cow; and by retarding his progressive thrift, and the improvement of his little property, for the benefit and hereditary succession of his wife and children."

"In the facility of execution, and in the permanence of effect, a very material difference exists between measures taken for the improvement of the cottager's means of life in *his own cottage*, and for the increase of his resources and incitements to thrift and industry, and those for the support and conduct of all public charities and establishments for the relief of the poor. The latter require an unattainable continuance of exertion, and an unending succession of disinterested care and attention: the former executes itself. The latter provide for the maintenance and relief of helpless and hopeless dependents: the former produces the *restoration* of health and strength.—When the cottager has acquired, and feels the benefit of, his new means and habits of life, his own exertions, his own attentions, will provide for the continuance of the blessings of his family, as long as

his landlord will protect him in the enjoyment of his cottage and ground. He requires, in this instance, no subsequent labour or attention, on the part of his benefactor, to prevent the return of indigence and misery; whereas it demands the continuance of unwearied exertions in all public establishments, to conduct them properly, for the solace and relief of existing wretchedness.

"In all that has been done by the Earl of Winchelsea for his cottagers, though there has been much attention paid, and much disposition on his part to make a very considerable sacrifice, if requisite, for their benefit, yet in fact, and with the single exception which I have stated as to his cottages, so far from any loss or expence being incurred by him, a considerable and permanent improvement has been made upon his estate, without any reduction in the immediate profit.—While the land let to the cottager is let at the same rent, as that which the farmers occupy, the country is enriched and improved by an industrious and thriving tenantry, and the poor's rates reduced almost to nothing. The labourers' children are at the same time so bred up, and so accustomed to regular habits of employment, as to be very little burthen to their parents, and to be a great improving benefit to the estate.—The land-owner should keep in mind, that if the labourer is reduced to indigence, his support, which had been derived from his own exertions, must, in future, be drawn from the land. The farmer, indeed, *nomi- nally* pays the poor's rate; but it is *really and ultimately defrayed by the landlord*; whose estate, by the increase and accumulation of poor's rate, is deteriorated in value, and diminished in rental: while, on the contrary, by a different system—by promoting the welfare, and encouraging the energy of the cottager—the land-owner might have lessened the poor's rate and augmented the value and rental of the land.

"I do not mean to assert that the English cottager, narrowed as he now is in the means and habits of life, may be immediately capable of taking that active and useful station in society, that is filled by those who are the subjects of this paper. To produce so great an improvement in character and circumstances of life, will require time and attention. The cottager, however, of this part of the county of Rutland, is *not of a different species from other English cottagers*; and if he had not been protected and encouraged by the landlord, he would have been the same helpless and comfortless creature that we see in some other parts of England. The farmer (with the assistance of the steward) would have taken his land; the creditor, his cow and pig; and the workhouse, his family.

"As I am disposed to flatter myself, that some of my readers, who have landed property adapted to the experiment, *may be induced to try this mode of improving their estates*, I shall suggest what occurs to me as the method of proceeding; premising that in this, and every thing else which the landlord may think fit to do for the benefit of his cottagers, he should be extremely careful not to make them the subjects of jealousy, or dislike, to either the farmer or shopkeeper; on whose goodwill to them, in spite of every attention of the landlord, much of their comfort and well-being will depend, particularly in winter, when the presence of a friend and protector is most wanted. I should therefore recommend him, at first, to follow the example of Mr. Burdon, and to begin with a close or two of the ground in his own occupation. Let him then select two or three of his most thriving and industrious labourers, and inform each of them, that he is disposed to accommodate him with a little ground, at a moderate rent, if he can contrive to get a cow, and his wife can manage her: adding the offer of a small loan or donation towards it. The introduction of so novel a system may possibly require some aid and attention at first; and it may be proper that the poor's rate on their ground should be kept down, as low as may fairly be; but as soon as two or three cottagers have succeeded, and it is known that

upon land becoming vacant in future, the cottager will be considered as well as the farmer, though not to his injury or inconvenience; and that, upon the occupier of any little farm of 20 or 30 acres being obliged, as they frequently are, to abandon a losing concern, the landlord would, in some instances, be disposed to apply the ground for the accommodation of five or six of the most deserving and thriving labourers; the farmers would soon be reconciled to a system which must in its nature operate to lower the poor's rate, and to diminish the burthen of the poor;—the character of the cottager would be invigorated;—his spirit, his industry, his economy, would be all put in action; and a very essential improvement would take place in the state and neighbourhood."

To place this subject in a stronger point of view, we add the following excellent observations on the means of enabling a cottager to keep a cow from the produce of a small portion of arable land, by Sir John Sinclair, bart. M. P.

"In several parts of the kingdom, as in Lincolnshire, Rutlandshire, &c. which are calculated for grazing, it is not unusual to give industrious cottagers as much land as will enable them to keep a cow, and sometimes two, or more, besides other stock; and it appears from the communications of Lord Winchelsea and others to the Board of Agriculture, from the publications of the Society for bettering the Condition of the Poor, and from a late interesting work printed by Mr. Arthur Young, that such a system is productive of the happiest consequences. It is supposed, however, to be totally inapplicable to an arable district. I trust that such an opinion will not be admitted without full consideration. Indeed, so far as I can judge, this advantageous system is to the full as well adapted for the one district as for the other. It requires unquestionably more labour on the part of the cottager, and of his family; at the same time, the occupation of so great an extent of ground is not so necessary in arable as in grazing countries; a circumstance, in various respects, extremely material.

"In arranging the following plan (which the reader will please to consider merely as furnishing an outline, to be perfected by further discussion and experiment), it is proposed to keep in view the following principles:

"1. That the cottager shall raise, by his own labour, some of the most material articles of subsistence for himself and his family.

"2. That he shall be enabled to supply the adjoining markets with the smaller agricultural productions. And,

"3. That both he and his family shall have it in their power to assist the neighbouring farmers, at all seasons of the year, almost equally as well as if they had no land in their occupation.

"It can hardly be questioned, that if it were practicable to have a number of cottagers of that description in every parish, it would promote, in various respects, the interests of the public.

"I. *Extent of land necessary.*—Unless the experiment were fairly tried, it is impossible to state exactly the extent of arable land requisite to enable a cottager to raise the articles generally necessary for the subsistence of himself and family; and to keep a cow, some pigs, and poultry. Much must depend on the natural richness of the soil; (though, under the management about to be proposed, almost any soil would, in time, become fertile); on the nature of the climate; on the size of the cow; on the industry of the cottager; on the age and number of his family, &c. But I should imagine that three statute acres and a quarter of good arable land, worth from 20s. to 30s. per acre, would be sufficient. It is proposed that the three acres shall be under a regular course of cropping. The quarter of an acre ought, if possible, to be converted into an orchard; where the cow might occasionally pasture, and where a pond ought to be kept in good order, that it may have plenty of water at command. Were the land of a

quality fit for lucerne, perhaps two acres and a quarter might be sufficient.

"II. *Stock and instruments of husbandry.*—It is evident that so small an extent of land as either two or three acres, under cultivation, excludes all idea of ploughing; and, indeed, unless the cottager shall manage the whole in the simplest and cheapest manner, there is an end to the whole system. It would require, indeed, four or five acres to keep a single horse, and the expence of purchasing horses, or even oxen, ploughs, and other instruments of husbandry, must be far beyond the abilities of a cottager; whereas with a spade, a hoe, a rake, a scythe, a sickle, and a flail, which are all the instruments really necessary, he is perfectly competent to the management of his little farm.

"III. *Course of crops, &c.*—The three acres proposed to be cultivated should be divided into four portions, each consisting of three roods, under the following system of management:

	Roods.
Under potatoes two roods, under turnips one	3
Under winter tares two roods, spring tares one	3
Under barley, wheat, or oats	3
Under clover, with a mixture of rye grafs	3
Total 12	

"Other articles besides these might be mentioned, but it seems to me of peculiar importance to restrict the attention of the cottager to as few objects of cultivation as possible.

"It is proposed that the produce of the two roods of potatoes shall go to the maintenance of the cottager and his family; and that the rood of turnips should be given to the cow in winter and during the spring, in addition to its other fare.

"The second portion sown with tares (the two roods of potatoes of the former year to be successively sown with winter tares, and the turnip rood with spring tares), might partly be cut green, for feeding the cow in summer and autumn; but, if the season will permit, the whole ought to be made into hay for the winter and spring feed, and three roods of clover cut green for summer food.

"The third portion may be sown either with barley, wheat, or oats, according to the soil or climate, and the general custom of the country. The straw of any of these crops would be of essential service for littering the cow, but would be still more useful, if cut into chaff, for feeding it.

"The fourth portion, appropriated to clover and rye grafs, to be cut green, which, with the assistance of the orchard, will produce, on three roods of land, as much food as will maintain a cow and her calf for five months, namely, from the end of May, or beginning of June, when it may be first cut, to the first of November, besides some food for the pigs. It is supposed that an acre of clover and rye grafs, cut green, will produce 20,000lbs. weight of food for cattle. Three roods, therefore, ought to yield 15,000lbs. weight. A large cow requires 120lbs. weight of green food per day; a middling sized cow, such as a cottager is likely to purchase, not above 90lbs.; consequently, in five months, allowing 1320lbs. weight for the calf and the pigs, there will remain 13,680lbs. for the cow. Were there, however, even a small deficiency, it would be more than compensated by the rood of land proposed to be kept in perpetual pasture as an orchard.

"IV. *Mode in which the family may be maintained.*—It is calculated that three roods and eight perches of potatoes will maintain a family of six persons for about nine months in the year; but, according to the preceding plan, it is proposed to have but two roods under that article; for however valuable potatoes are justly accounted, yet some change of food would

be acceptable, and the cottager will be enabled, from the produce of the cow, and by the income derived from his own labour, and from that of his family, to purchase other wholesome articles of provision.

"V. *Manner in which the stock may be kept.*—It appears from the preceding system of cropping, that ten roods of land, or two acres and a half, are appropriated to the raising of food for the cow in summer and winter, besides the pasture of the orchard; and unless the season should be extremely unfavourable, the produce will be found not only adequate to that purpose, but also to maintain the calf for some time, till it can be sold to advantage. It is indeed extremely material, under the proposed system, to make as much profit of the calves as possible, as the money thus raised will be a resource, enabling the cottager to replace his cow when a new one must be purchased.

"For the winter provision of the cow, which is the most material, because summer food can be more easily procured, there is the produce,

"1. Of about three roods of tares made into hay.

"2. Of three roods of straw, deducting what may be necessary for litter; and if dry earb be put in the cow's hovel, and removed from time to time to the dunghill, little or no litter will be necessary.

"3. Of one rood of turnips.

"The whole will be sufficient for seven months in the year, namely, from the 1st November to the 1st June; and during the remaining five months, the pasture of the orchard, some of the winter tares, and the produce of three roods of clover and rye grafs, will not only suffice, but will furnish a surplus for the calf, if it is kept for any length of time, and some clover for the pigs.

"The inferior barley, potatoes, &c. will of course be given to the pigs and the poultry.

"VI. *Value of the produce.*—The land thus managed will certainly produce, by means of the extra industry of the family, and at a small expence, a most important addition to the income which the cottager may derive from his ordinary labour. For instance:

	per Ann.
1. The orchard (after the trees become fruitful)	£. 1 10 0
will probably yield	
2. Three roods of turnips and potatoes	4 0 0
3. Eighteen bushels of barley, at 4s.	3 12 0
4. The cow and calf	7 0 0
5. Hogs	3 0 0
6. Poultry and eggs	2 0 0

Total £. 21 2 0

"Where wheat can be raised instead of barley, the profit would be still more considerable. Opinions will differ much regarding the value put on each article; but that is of little consequence, as the total cannot be accounted too high.

"VII. *Time required for cultivating the land.*—The quantity of land intended to be cultivated, will not materially interfere with the usual labour of the cottager. It will only require to be dug once, and is then fit to be cropped. It is proposed that only nine roods shall be annually cultivated (the remaining three roods being under clover and rye grafs), and nine roods may be dug in the space of about 558 hours, or at the rate of 62 hours per rood. This might be done at by-hours (more especially when the family of the cottager shall be somewhat advanced, and consequently more able to furnish assistance); but supposing that the digging, manuring, harvesting, &c. will require twenty entire days per annum in addition to the by-hours, and allowing sixty days for Sundays and holidays, there will remain 285 days for the ordinary hand labour of the cottager, which, at 1s. 6d. per day, would

amount to 2 *l.* 7s. 6d.; the earnings of the wife and children may, at an average, be worth at least 4 *l.* per annum more. This is certainly a low calculation, considering how much may be got during the hay and corn harvests; but even at that moderate estimate, the total income of the family will be as follows:

1. Produce of the farm	-	-	£. 21	2	0
2. Labour of the cottager	-	-	21	7	6
3. Earnings of the family	-	-	4	0	0

Total £. 46 9 6

"VIII. Buildings.—It is impossible to calculate the expence of building a cottage, as so much depends upon its size, the place where it is situated, the materials of which it is composed, the price of labour in the country, and a variety of other circumstances. On this important subject, much useful information is contained in the first volume of the Communications published by the Board of Agriculture. But it is proper to observe that no expensive additional buildings will be necessary in consequence of the proposed system. A shed or hovel for the cow cannot occasion any very heavy charge, and a small barn, of the simplest and cheapest construction, may be of use, not only for threshing the crop, but also for securing the hay, and making it to more advantage, in case the season should prove unfavourable: if the corn is put up in small stacks, the barn may be made of very moderate dimensions.

"IX. Rent, and Balance of Income.—The rents of cottages and of land vary to much in different parts of the kingdom, that it is difficult to ascertain an average. But if the cottage shall be slated at 3 *l.* per annum, the land at 2s. per acre, and the orchard at 10s. the whole will not exceed 7 *l.* 15s. The cottager will also be liable to the payment of some taxes, say to the amount of 1 *l.* 5s. more. Hence the total deductions would be about 9 *l.* leaving a balance in favour of the cottager of 3 *l.* 9s. 6d. Considering the cheap rate at which he is furnished with a quantity of potatoes, equal to several months' consumption, and with milk for his children, surely, with that balance, he can find no difficulty not only in maintaining himself and family in a style of comfort, but also in placing out his children properly, and laying up a small annual surplus, that will render any parish assistance, whether in sickness or old age, unnecessary; and thus he will be enabled to preserve that manly and independent spirit which it so well becomes a British cottager to possess.

"Advantages of the proposed system.—I shall now endeavour briefly to explain some of the advantages which may be looked for with confidence from the proposed system.

"1. In the first place, the land possessed by the cottager would be completely cultivated, and rendered as productive as possible. The dung produced by the cow, the pigs, &c. would be amply sufficient for the three roads under turnips and potatoes; which would afterwards produce, 1. Tares, 2. Barley, and 3. Clover; with a mixture of rye-grass, in regular succession, without any additional manure. The barley should yield at least eighteen bushels, besides three bushels for seed; and if wheat or oats are cultivated, in the same proportion. The milk, deducting what may be necessary for the calf, and for the cottager's family, might be sold in its original state, if there shall be a market for it, or converted into butter, for the purpose of supplying the neighbouring towns or villages. Such cottagers, also, might certainly send to market both eggs and poultry.

"2. It is hardly possible to suggest a measure more likely to promote the benefit of a numerous and valuable body of people. The system of keeping cows by cottagers, which has been found so advantageous in the grazing districts, may thus be extended over the whole kingdom; and, indeed, if the

above plan is found to answer, in place of four or five acres employed in feeding a single cow, it would be much better, even in the grazing counties, to restrict the land to a smaller quantity, under a tillage mode of management; for thus not only the cow, but also the cottager himself, and his family, would, in a great measure, be maintained by a less surface of soil.

"3. It is of infinite consequence to establish the practicability of this system, as the means of removing a most unfortunate obstacle to the improvement of the country. It is well known to be the only popular objection to the inclosure of our wastes and commons, that, while uninclosed, a number of cottagers are enabled to keep cows by the means of their common rights, and that their cows disappear when the commons are inclosed. But if so small a portion of land as 3 $\frac{1}{2}$ acres, when improved and properly cultivated, can enable a cottager to keep a cow even to more advantage than with a right of common; which can hardly be doubted, as he is enabled to provide winter as well as summer food; there is an end to that obstacle to improvement. Indeed, if sufficient attention be paid to the principles above detailed, the situation of the cottager, instead of being deteriorated, would be materially bettered by the inclosure; and his rising family would be early accustomed to habits of industry, instead of idleness and vice.

"I shall conclude with asking," says Sir John Sinclair, "if any one can figure to himself a more delightful spectacle than to see an industrious cottager, his busy wife, and healthy family, living in a comfortable house, rented by himself, cultivating their little territory with their own hands, and enjoying the profits arising from their own labour and industry; or whether it is possible for a generous landholder to employ his property with more satisfaction, or in a manner more likely to promote, not only his own, but the public interest, than in endeavouring to increase the number of such cottagers, and encouraging, by every means in his power, the exertions of so meritorious and so important a class of the community?"

Plan of the proposed Cottage Farm, pointing out the Rotation of Crops in the different Lots.

Cottage.		The Orchard, or perpetual Pasture.		Pond.
Lot A. 3 Roads. 2 Roads Potatoes 1 Road Turnips		Lot B. 3 Roads. 2 Roads Winter Tares 1 Road Spring Tares		
1. Year {		1. Year {		
Lot C. 3 Roads.		Lot D. 3 Roads.		
1. Year—Barley, Wheat, or Oats		1. Year—Clover and Rye-grass.		
The Rotation of Crops for four Years.				
Year	Lot A.	Lot B.	Lot C.	Lot D.
1	Potatoes and Turnips	Winter and Spring Tares	Barley, Wheat, or Oats	Clover and Rye-grass
2	Winter and Spring Tares	Barley, Wheat, or Oats	Clover and Rye-grass	Potatoes and Turnips
3	Barley, Wheat, or Oats	Clover and Rye-grass	Potatoes and Turnips	Winter and Spring Tares
4	Clover and Rye-grass	Potatoes and Turnips	Winter and Spring Tares	Barley, Wheat, or Oats

The rotation then begins as at first. Let D might continue in natural grass the first season, to diminish the labour of that year.

The exact period when the different crops shall be dug for, or sown, cannot be ascertained, because it varies so much in different counties, and depends upon the seasons; but, according to the above rotation, the labour of digging for the various crops is diversified as much as possible, so as not to interfere materially with the other occupations of the cottager. At no period would it be necessary for him to dig more than two rods in a month; and both he and his family will labour with much more satisfaction and dispatch when they work for themselves than for another. In case of necessity, the cottager might hire some of his neighbours to assist him in digging, which would be much better than hiring a plough. If a cottager under this system could not work as a common daily labourer, he might, at least, answer as a useful labourer by the piece.

COTTON (Encycl.). Is separated from the seeds of other extraneous matter by a process called *Batting*; for an account of a machine, or mill, lately invented for that purpose, see the article *BATTING* in this supplement. The following is a specification of the patent granted to Mr. Greatrix, of Hulme, near Manchester, callico printer and dyer; for a new invented process and method of dyeing and staining colours upon cotton, linen, and mixed goods.

"To dye a black upon cotton, linen, and cotton and linen mixed," says the inventor, "I take tar, iron liquor of the very best quality, adding to each gallon thereof, three quarters of a pound of fine flour, and by boiling bring it to the consistency of a thin paste. I put the liquor or paste above mentioned into the tub marked No. 3, belonging to the machine used in this process, a section and horizontal plan of which, with reference to, and description of, the several parts whereof, is herewith annexed. (See Plate 20.) The goods intended to be dyed are wound upon the roller No. 14, and passed through the liquor or paste above mentioned, betwixt the two rollers 7 and 12; thereby completely staining or dyeing the whole mass or body of the cloth. I pass them into a very hot stove or drying-house till dry. I take cows-dung, put it into a large copper of water about scalding hot, and mix it well together, through which I pass the piece of cloth until it be thoroughly softened. Note: the quantity of dung, and the time necessary in this process, depend upon the substance of the cloth, and the quantity of the paste or liquor imbibed in it. I take and wash the goods, so dunged, extremely well in water. I take a quantity of madder, or logwood, or sumach, or any two of them, or all of them mixed together, as the strength of the cloth and nature of the colour may require, and put them into a copper, or tub of hot water; then enter the goods before mentioned into this liquor, and keep rinsing or moving them therein, until I have brought them up to the strength of colour required. I have the goods again well washed and dried. Note, for dyeing black, it will be proper to pass the goods a second time through the above operations; adding more or less of the dyeing-woods as before. Note also, that if, after the above operations and the shade of colour is too full, or too much upon the red hue, it will be necessary to give them a little sumach, and then run them through a liquor made from iron and ewler, or alder bark. Another method of dyeing black: I take common iron liquor, and add three quarters of a pound of fine flour, and by boiling bring it to the consistency of a thin paste; or, instead of flour, I add glue or linseed, or gum, or any two, or all of them mixed together, till it is brought to a proper thickness. I then pass the goods through the machine, and follow the before-mentioned operations. To dye olives, bottle greens, purples, browns, cinna-

mons, or snuffs, I take common iron liquor, or common iron liquor with alum dissolved in it, or common iron liquor with alum and saccharum saturni dissolved therein, in quantity of each according to the shade of colour wanted, made into a paste or liquid, by adding flour, gum, glue, linseed, or one or more of them as before. I then put the liquor or paste above mentioned into the tub marked No. 3, belonging to the machine before described, and pass the goods so intended to be dyed through the machine in the same manner I have described for dyeing black. I take them from the machine, and hang them up in a very cool room, where they remain till thoroughly dry. I take cows-dung, put it into a large copper of hot water, and mix it well together; through which I pass the cloth or goods until thoroughly softened, the quantity of dung and time requisite, being proportioned as before. The goods after this process being well washed, I take a quantity of liquor made from madder, logwood, sumach, fustic, brazil, woad, quercitron bark, peach wood, or other woods, to produce the colour wanted, or any two, or more of them; and, in case I see it necessary, I dilute this liquor with water, according to the shade or fullness of colour I want to dye. I then work the goods through this liquor very well; after which I pass them through cold or warm water, according to the colour, the proper application of which is well known to dyers, adding a little alum, copperas, or Roman vitriol, or two or more of them, first dissolved in water. I then wash them off in warm water, and dry them. Note, if the colour is not sufficiently full, I repeat the same operations till it is brought to the shade required. To dye crimson, red, orange, or yellow, I take red liquor, such as is generally made from alum, saccharum saturni, or such-like ingredients, and dilute it with water, according to the strength or shade of colour I want to dye, bringing it to the consistency of a paste or liquid, as before described. Then pass the cloth through the machine; which being dried in a cool room, pass it through the operations of dunging and washing as before. I take a quantity of liquor, made from cochineal, madder, peach-wood, brazil, logwood, woad, fustic, sumach, or any two or more of them proportioned in strength to the shade or colour I want to dye, and work the goods through this liquor very well, till I have brought them to the shade of colour required; after which I wash them in cold or warm water, and dry them."

Description of the machine. No. 1, The frame. 2, The cloth or hatting which conveys the paste or liquor to the piece of cloth intended to be dyed. 3, The tub made to contain the paste. 4, Another tub, which receives the superfluous liquor or paste from the piece, and conveys it into No. 3. 5, 6, and 7, are three rollers, round which the hatting runs; passing through the tub of liquor, No. 3. 8, and 9, two screws, for the purpose of tightening the hatting. 10, and 11, two screws which press the roller No. 7, against the roller No. 12, betwixt which the piece passes. 12, A roller on which the fly-wheel No. 13 is fixed, which puts the machine in motion. 13, The fly-wheel. 14, The roller on which the piece is wound. 15, The piece passing through the liquor, and betwixt the rollers 7, and 12. 16, Another roller, which draws the piece from the machine, by a strap worked from a pulley, on the roller No. 12.

COTTON-MILLS (Encycl.). It has been the practice of many parishes, particularly of the metropolis, to send the children of the poor to be employed in these manufactories, for the most part, very greatly to the injury of their health and morals. That this, however, is not uniformly the case, appears from the following extract from an account of Mr. Dale's cotton-mills at New Lanark, in Scotland, published in the Reports of the Society in London for bettering the Condition of the Poor.

The cotton-mills at New Lanerk in the county of Lanerk in Scotland, are situate on a beautiful and romantic amphitheatre, near the high road between Carlisle and Glasgow. The rapid stream of the Clyde supplies that abundance of water, which is the powerful operator of the machinery. For the purpose of conveying and directing its power, a subterraneous aqueduct is cut for many hundred yards through the solid rock. The first mill, in length 154 feet, was originally erected in 1785; and, having been burnt down, was rebuilt in 1789. The second is exactly of the same dimensions; the third is 130 feet, and the fourth 156 feet, in length.

The two first mills contain 12,000 spindles for spinning water twist; the other two are occupied by jennies, for spinning mule yarn.—The village of New Lanerk owes its existence to the erection of these mills. It consists of neat substantial houses; forming two streets about half a mile in length, and broad, regular, and clean. Near the centre of the village are the mills; and opposite to them, a neat mansion, the occasional residence of Mr. Dale, the proprietor, and of his principal manager. The village, consisting chiefly of Highlanders from the counties of Argyle, Caithness, and Inverness, contains about 1,500 inhabitants; of whom all who are capable of work are employed in and about the mills. Of these, there are 500 children who are entirely fed, clothed, and educated by Mr. Dale. The others lodge with their parents in the village, and have a weekly allowance for their work.

The healthy and pleasurable appearance of these children has frequently attracted the attention of the traveller. Peculiar regulations, adopted by Mr. Dale for the preservation of the health and morals of those under his protection, have made this striking difference between his manufactory and many other similar undertakings in this kingdom; so that while some other mills must be regarded as seminaries of vice, and sources of disease, those at Lanerk are so peculiarly exempt from these objections, that out of near 3,000 children employed in these mills during a period of twelve years, from 1785 to 1797, only fourteen have died; and not one has been the object of judicial punishment.

In order to supply that first necessary of life, pure and fresh air, the windows of the manufactory are frequently opened; and in summer there are air holes left under every other window.—Cleanliness is another great object of attention. The children wash themselves before they go to work, and also after it before they appear in the schools. The floors and the machinery are washed once a-week with hot water; and the ceilings and walls, twice a-year, with unslaked lime.—The children who reside in the house, and who have their maintenance in lieu of wages, are lodged in six large airy apartments. The boys and girls are kept *diffinitely* apart; not only in the hours of rest and refreshment, but during the time of occupation.—They sleep on cast-iron bedsteads, the bed-tick filled with straw, which is changed regularly every month. The bedrooms are swept, and the windows thrown open every morning, and kept open all the day. Many of the children have contrived to provide themselves with boxes with locks; in which they keep their books and their little property. Their upper clothing in summer is cotton, which is washed once a fortnight. In winter the boys are dressed in woollen; and, as well as the girls, have dresses (suits for Sundays).

For dinner they have seven ounces each of fresh beef with barley broth, or alternately five ounces of cheese; and a plentiful allowance of potatoes, or barley bread. This part of the table diet is seldom varied; except in winter by a dinner of fresh herrings, as a change. Their breakfast and supper consist of oatmeal porridge, with the addition of milk in summer; and, during the winter, with a sauce made of molasses and beer.

Seven o'clock is the hour of supper; soon after which *(for that pernicious practice, called night-work, is entirely excluded from these mills)* the schools commence, and continue till nine o'clock. Mr. Dale has engaged three regular masters, who instruct the lesser children during the day. In the evening they are assisted by seven others, one of whom teaches writing. There is likewise a woman to teach the girls sewing, and another person who occasionally gives lessons in church music. The masters preside over the boys' dinner table. On Sundays they conduct them to the place of divine worship; and, in the evening of Sunday, attend to assist and improve them, by religious and moral instruction.

In the year 1791, a vessel carrying emigrants to America, from the isle of Skye, was driven by stress of weather into Greenock, and about 200 persons were put on shore in a very destitute situation. Mr. Dale offered them all immediate employment; which the greater part accepted. Soon after he notified to the people of the Highlands and the Hebrides, the degree of encouragement which he would give to families at the cotton mills; and undertook to provide houses for 200 families. These were finished in 1793: in consequence of which a considerable number of Highlanders have taken up their residence at New Lanerk. Several families also, who were last year driven from Ireland, have found immediate employment here.

"Amid the numerous variety of cotton mills," says Mr. Bernard, "that have been erected in this kingdom, I sincerely wish it were in my power to shew many examples like those of Mr. Dale's mills at Lanerk. Some few of these manufactories have been distinguished for attention to health and cleanliness, and many of them for very curious mechanism, and ingenious inventions, by which the operations are produced and facilitated; but I have not had the good fortune to find in any (though I doubt not but it may exist in some instances) that proper degree of attention, which ought to be paid to the morals and instruction of the children. *Where boys and girls are indiscriminately employed at all hours, not only of the day, but of the night, and are mingled together without any advantage of education, without benefit of religious instruction or moral principle, and without any friend to advise or protect them, can we be astonished at their plunging in a very early age, and almost during childhood, in every wretched and disgusting species of debauchery? Can we be surprised that our numerous and crowded manufactories should be the nurseries of thieves and prostitutes; sent out at an early age to their own ruin, and to the annoyance of the kingdom, and of every individual of which it is composed?*"
